45. Venetian possessions in the Greek world 1700

EDITOR'S NOTE

This is first and foremost a book about Greece. But what do we mean by Greece? Is it that remote fairyland of myth and legend ruled by unruly demigods such as Theseus and Agamemnon? Or is it the (much closer to home) source of democracy, reason, fair play, and all the values that we think of today as forming the basis of "our" so-called Western civilization? Do we mean the homeland of Alexander the Great, that most successful general and most romantic hero of all time, who extended his conquests as far as Central Asia? Or is it rather the fatherland of Aristotle Onassis, doyen of 20th-century shipowners, who was born in Asia Minor and was a man of the world if ever there was one? Do we regard Greece as the heart of an empire that touched most of the shores of the Mediterranean and beyond, or as one of the less conspicuous members of NATO or the European Union? Does it put us in mind of dreaming columns in the sunset at Sunium, or of icons and incense on Mount Athos, of *Zorba the Greek*, or the gay clubs of Mykonos? Greece is all these things, and more. They are all the subject-matter of this book.

Secondly it is a book about the Greeks. But who are the Greeks? This question has been debated by scholars for centuries, and the debate continues to this day. For the purposes of this book, we take the Greeks to be all those who speak or spoke the Greek language.

Thirdly, and just as important, it is a book about the Hellenic tradition. We are all of us, whether we like it or not, participants in a tradition, or more likely several traditions. The Hellenic tradition is the cultural tradition in which all Greeks, all Greek-speaking people, participate. Its manifestations are legion and they take different forms at different times. Some of these exhibit a clear thread of continuity throughout the three and a half millennia of Greek history; others, perhaps the majority, come and go, shining brightly for a while before disappearing, but later perhaps resurfacing. The most obvious vehicles of cultural transmission are language and (at least for the last two millennia) religion; but this book will demonstrate that there have been many others, less conspicuous but equally effective, at work in the process.

It will have become clear already that this is not a book about the Hellenic tradition in global terms. It is not about the influence that Hellenism has exerted on other cultures and other peoples. It is restricted to the history and culture of the Greeks themselves, though such restrictions do not preclude (indeed they demand) a global dimension: the Hellenic tradition today is spread far and wide and is just as vibrant in Toronto and Melbourne, and in London and Johannesburg, as it is in Corfu and Nicosia. Even Constantinople, once the queen of cities and Greek-speaking hub of a multi-ethnic empire, later the ultimate but ultimately unattainable goal of the Great Idea, now the home of a tiny and ever-dwindling minority, is still the seat of the Ecumenical Patriarchate to which all Eastern Orthodox Churches owe allegiance.

These then are the cultural boundaries of the book: Greece and the Greeks for the 3500 years of their recorded history. But the syllabus would not be comprehensive without the inclusion of certain extramural topics. Thus there are articles on many of the peoples who have impinged on Greek history and have made significant contributions to the development of Greek culture. In each case the article focuses on the nature of that contribution and the period of that people's interaction with the Greeks, not on the history of the people as a whole. Similarly, articles concerned with places outside the Greek heartlands concentrate primarily on the time during which they were relevant to Greek culture, not their entire history. And there are a few (very few actually) articles about individuals who were not Greeks at all but who are remembered for the contribution that they themselves made to Greece (Hadrian, Mehmet II, Byron, to name but three). In all categories hard decisions had to be made about selection. The result is inevitably a compromise, but we hope at least a representative one.

In addition to the articles on people and places there are thematic articles which attempt to trace the manifestations of the theme concerned throughout the span of Greek history. Again there will be exceptions, because certain themes apply only to particular periods in time; but wherever practicable, the attempt has been made to demonstrate the continuities in Greek culture across the centuries.

Finally there are two extended series of articles. Those devoted to the political history of Greece are easily found because they follow on sequentially under "Political History". These articles are, for reasons of convenience and practicality, divided into the normally recognized periods (though elsewhere in the book there is a conscious effort to avoid periodization). Complementing them is a second series of articles devoted to the cultural history of those same periods; but these are scattered through the book according to the name by which they are most usually known. Thus, after articles on Prehistory, Minoans, and Mycenaeans, there follow Dark Age, Geometric, Archaic, Classical, Hellenistic, Roman, Byzantine (Early, Middle, and Late), Latin Empire, Venetokratia, Ottoman, and Modern Period.

Every article is equipped with a number of suggestions for further reading on the subject. Wherever possible, these are easily accessible sources in major European languages. Cross-referencing between articles has been kept to a minimum in view of the lists of articles at the start of the book and the index at the end; but in general it operates in the direction from the particular to the general.

Acknowledgements

This book was my idea; but a great many people have devoted time and expertise to making it happen. On the academic side, the headword list was compiled with the generous assistance of a distinguished panel of advisers who are listed on p.ix. A vast army of expert contributors from every continent responded with enthusiasm and scholarly acumen to a challenging brief. It has been an enormous privilege for me to work with them. If this book fills a gap in the reference library, it does so only because of their willingness to participate in it. Their efforts fill me in equal measure with gratitude and humility.

On the practical side, maps were compiled by Olive Pearson and site plans by Tom Willcockson, and pictures were researched by Linda Proud. Editorial management and a sense of order were imposed by Carol Jones and, in the final year of the project, by Jonathan Dore, who worked with great dedication to see it through to completion. Delia Gaze, Kara Hattersley-Smith, and Lucilla Watson edited the manuscript; David Edmonds read the proofs; and Christine Headley made the index. I am more grateful than I can say to all of them. But my greatest public debt is to Daniel Kirkpatrick, Managing Director of Fitzroy Dearborn, who was bold enough to commission the project in the first place and has been the most hard-working and the most unassuming member of the team ever since.

This is no place to acknowledge my private debts. The people involved already know who they are, though only I know just how much I owe them. This book is for them. But it is also for all other Hellenists, Hellenes, and Philhellenes everywhere. What has impressed me more than anything about Greece in compiling this book is its astonishing capacity for survival and regeneration. No matter how devastating the catastrophe – from whatever it was that destroyed the civilizations of the Bronze Age to the Asia Minor disaster of 1922 – Greece will always rise again. The tradition is unsinkable. There is something inspiring about that.

Venizelos, Eleftherios
Zervas, Napoleon

Industrialists
Chandris, Antony
Livanos, George P.
Niarchos, Stavros
Onassis, Aristotle

Religious
Athenagoras
Nektarios of Aegina, St
Makarios III, Archbishop

CHRONOLOGICAL LIST OF INDIVIDUALS

*fl.*8th or 7th century BC	Hesiod
*fl.*8th or 7th century BC	Homer
*fl.*7th century BC	Archilochus
*c.*640–*c.*560 BC	Solon
b. *c.*630 BC	Sappho
*fl.*6th century BC	Aesop
*fl.*6th century BC	Amasis
*fl.*6th century BC	Execias
*fl.*6th century BC	Pythagoras
b. *c.*557/56 BC	Simonides
d. *c.*547 BC	Anaximander
*c.*530–480 BC	Leonidas
d. *c.*528 BC	Pisistratus
*fl.*525–505 BC	Cleisthenes
*c.*525–456 BC	Aeschylus
*c.*525–459 BC	Themistocles
*c.*518–*c.*438 BC	Pindar
*c.*515–*c.*440 BC	Parmenides
b. *c.*510 BC	Bacchylides
*c.*510–*c.*450 BC	Cimon
*fl.*6th–5th centuries BC	Hecataeus of Miletus
*fl. c.*500 BC	Heraclitus
*fl.*5th century BC	Polygnotus
*c.*500–428 BC	Anaxagoras
*c.*496–406 BC	Sophocles
*c.*492–429 BC	Pericles
*c.*492–432 BC	Empedocles
*c.*490–420s BC	Phidias
484–*c.*425 BC	Herodotus
*c.*480–*c.*407/06 BC	Euripides
*fl.*478–466 BC	Hieron I
470–399 BC	Socrates
*c.*460–*c.*370 BC	Hippocrates
*c.*459/58–*c.*375 BC	Lysias
451/50–404/03 BC	Alcibiades
*c.*445–374/73 BC	Evagoras
*c.*444–359 BC	Agesilaus II
*c.*436–338 BC	Isocrates
*c.*430–367 BC	Dionysius I
*c.*430–*c.*353 BC	Xenophon
429–347 BC	Plato
*fl.*4th century BC	Praxiteles
*c.*400–*c.*320s BC	Ephorus
d. *c.*395 BC	Thucydides
d.395 BC	Lysander
b. *c.*390 BC	Lysippus
*c.*390–*c.*340 BC	Eudoxus
d. *c.*386 BC	Aristophanes
384–322 BC	Aristotle
384–322 BC	Demosthenes
383/82–336 BC	Philip II
378/77–*c.*320 BC	Theopompus
*c.*371–*c.*287 BC	Theophrastus
b. *c.*370 BC	Apelles
b. *c.*370 BC	Aristoxenus
*c.*365–275 BC	Pyrrho
*c.*364–?260 BC	Hieronymus of Cardia
d.362 BC	Epaminondas
*fl.*360–335 BC	Scopas
356–323 BC	Alexander III the Great
d.353 BC	Mausolus
342–292 BC	Menander
341–270 BC	Epicurus
335–263 BC	Zeno of Citium
*c.*330–*c.*260 BC	Herophilus
d. 320s BC	Diogenes of Sinope
*c.*320–*c.*240 BC	Callimachus
319–272 BC	Pyrrhus
*c.*315–*c.*240 BC	Erasistratus
*fl.*4th–3rd centuries BC	Euclid
*fl.*3rd century BC	Apollonius of Perge
*fl.*3rd century BC	Herodas
*fl.*3rd century BC	Theocritus
*c.*295–215 BC	Apollonius Rhodius
*c.*287–212/11 BC	Archimedes
d. *c.*260 BC	Timaeus
260–219 BC	Cleomenes III
*c.*252–182 BC	Philopoemen
*c.*242–187 BC	Antiochus III the Great
d. *c.*240 BC	Aratus
238–179 BC	Philip V
b. *c.*215 BC	Crates of Mallus
*c.*215–*c.*143 BC	Aristarchus of Samothrace
214/13–129/28 BC	Carneades
d. *c.*200 BC	Eratosthenes
*fl.*3rd or 2nd century BC	Lycophron
*fl. c.*2nd century BC	Nicander
*fl.*2nd century BC	Hipparchus
*c.*200–*c.*118 BC	Polybius
*c.*135–*c.*51 BC	Posidonius
*c.*110–40 BC	Philodemus
*fl.*1st century BC	Dionysius of Halicarnassus

*fl.*1st century BC	Diodorus Siculus
69–30 BC	Cleopatra
*c.*64 BC–*c.*AD 19	Strabo
*c.*20 BC–*c.*AD 50	Mary, Blessed Virgin
*fl.*1st century AD	Philo
*c.*AD 30–107	Ignatius, St
37–68	Nero
37–after 93	Josephus, Flavius
*c.*40–112	Dio Cocceianus
*fl. c.*45–75	Dioscurides
*c.*50–120	Plutarch
d. *c.*64	Paul, St
76–138	Hadrian
*c.*90–160	Arrian
*c.*95–160s	Appian
*fl.*1st or 2nd century	Babrius
*fl.*1st or 2nd century	Heron
*fl.*2nd century	Achilles Tatius
*fl.*2nd century	Ptolemy
*c.*100–*c.*165	Justin Martyr, St
*c.*101/03–177	Herodes Atticus
*c.*115–180	Pausanias
117–*c.*180	Aristides, Aelius
*c.*120–180	Lucian
129–?208/16	Galen
*c.*130–*c.*202	Irenaeus
b. *c.*150	Athenaeus
*c.*150–*c.*215	Clement of Alexandria, St
*c.*164–after 229	Cassius Dio
184/85–254/55	Origen
*fl.*2nd or 3rd century	Diogenes Laertius
*fl.*2nd or 3rd century	Longus
*fl.*3rd century	Zenobia
205–269/70	Plotinus
234–*c.*305	Porphyry
*c.*255–*c.*330	Helena, St
*c.*260–339	Eusebius
273/74–337	Constantine I the Great
d. *c.*300	Demetrius, St
*fl.*4th century	Heliodorus
*fl.*4th century	Macarius (pseudo-)
*fl.*4th century	Nemesius
*c.*300–373	Athanasius of Alexandria, St
*c.*306–373	Ephraim the Syrian, St
314–*c.*393	Libanius
*c.*317–*c.*388	Themistius
*c.*329–*c.*390	Gregory of Nazianzus, St
*c.*330–379	Basil the Great, St
*c.*330–*c.*395	Gregory of Nyssa, St
331/32–363	Julian the Apostate
*c.*345–399	Evagrius of Pontus
*c.*347–407	John Chrysostom, St
370–413	Synesius
*c.*370–415	Hypatia
*c.*378–444	Cyril of Alexandria, St
*c.*381–*c.*451	Nestorius
*c.*393–*c.*466	Theodoret
d.403	Epiphanius of Salamis, St
*fl.*5th century	Nonnus
410/11–485	Proclus
*c.*475–*c.*538	Procopius of Gaza
*c.*482–565	Justinian I
*c.*490–570s	Philoponus, John
*c.*497–548	Theodora
*fl. c.*500	Dionysius the Areopagite, pseudo-
*fl.*6th century	Choricius of Gaza
*fl.*6th century	Simplicius
d. after 555	Romanos the Melodist, St
d. *c.*560	Procopius of Caesarea
*c.*575–641	Herakleios
*c.*575–*c.*649	John Klimakos, St
580–662	Maximos the Confessor, St
*fl.*7th century	Anastasios of Sinai, St
*fl.*7th century	George of Pisidia
*fl.*7th century	Isaac the Syrian, St
*fl.*7th century	Simokattes, Theophylaktos
*c.*660–740	Andrew of Crete, St
*c.*685–741	Leo III
*fl.*7th–8th century	Germanos I
718–775	Constantine V
d. *c.*750	John of Damascus, St
*c.*752–803	Irene
759–826	Theodore of Stoudios, St
*c.*760–818	Theophanes the Confessor, St
*c.*780–820	Leo V
*c.*790–after 869	Leo the Mathematician
*fl.*9th century	Kassia
*c.*810–*c.*893	Photios
812/13–842	Theophilos
812/18–*c.*886	Joseph the Hymnnographer, St
*c.*815–885	Methodios, St
826/27–869	Cyril, St
*c.*830–886	Basil I
866–912	Leo VI
d.867	Theodora
*c.*870–948	Romanos I Lekapenos
*fl.*10th century	Geometres, John
*fl.*10th century	Symeon the Logothete
905–959	Constantine VII
*c.*925–976	John I Tzimiskes
*c.*927/30–*c.*997	Athanasios of Athos, St
d. after 932	Arethas of Caesarea
949–1022	Symeon the New Theologian, St
958–1025	Basil II
*c.*978–1050	Zoe
*c.*1000–1055	Constantine IX Monomachos
1018–after 1081	Psellos, Michael
b. *c.*1025	Italos, John
*c.*1057–1118	Alexios I Komnenos
1083–*c.*1153/54	Komnene, Anna
1087–1143	John II Komnenos
*fl.*12th century	Apseudes, Theodore
*fl.*12th century	Michael of Ephesus
*fl.*12th century	Prodromos, Theodore
*fl.*12th century	Zonaras, John
*c.*1110–after 1165	Tzetzes, John
*c.*1115–*c.*1195	Eustathios
1118–1180	Manuel I Komnenos
*c.*1118/20–1185	Andronikos I Komnenos
1134–1219	Neophytos Enkleistos
*c.*1192–1254	John III Vatatzes
1197–1272	Blemmydes, Nikephoros
1217–1282	Akropolites, George
*c.*1225–1282	Michael VIII Palaiologos
*c.*1255–*c.*1305	Planudes, Maximos
1259/60–1328	Andronikos II Palaiologos
1270–1332	Metochites, Theodore
*c.*1280–*c.*1340	Triklinios, Dimitrios

*c.*1290–1348	Barlaam of Calabria
1290/94–1358/61	Gregoras, Nikephoros
*c.*1295–1383	John VI Kantakouzenos
1296–1359	Gregory Palamas, St
*fl. c.*1300	Panselinos, Manuel
*fl.*13th–14th centuries	Koukouzeles, St John
*c.*1300–*c.*1348	Akindynos, Gregory
*c.*1319–*c.*1391	Kabasilas, Nicholas
*c.*1350–1415	Chrysoloras, Manuel
1350–1425	Manuel II Palaiologos
d. 1355	Stephan IV Dushan
*c.*1360–1452	Plethon, George Gemistos
1392–1448	John VIII Palaiologos
1395–1472/73 or *c.*1484	George of Trebizond
*fl.*15th century	Chrysaphes, Manuel
*fl.*15th century	Kritoboulos, Michael
*c.*1400–1472	Bessarion
*c.*1400–1475/76	Gaza, Theodore
1401–1477/78	Sphrantzes, George
1405–1453	Constantine XI Palaiologos
*c.*1405–*c.*1472	Gennadios II Scholarios
*c.*1415–1487	Argyropoulos, John
d.1429	Symeon of Thessalonica, St
1432–1481	Mehmet II
*c.*1470–1556	Maximos the Greek, St
*c.*1490–1559	Theophanes of Crete
*fl.*16th century	Chortatsis, Georgios
*c.*1530–*c.*1592	Damaskinos, Michael
*c.*1530–1595	Jeremias II Tranos
*c.*1535–1608	Klontzas, Georgios
*c.*1541–1614	Theotokopoulos, Domenikos (El Greco)
1553–*c.*1614	Kornaros, Vitsentzos
1570–1638	Cyril I Lukaris
*c.*1574–1646	Corydalleus, Theophilos
*c.*1610–1690	Tzanes, Emmanuel
*c.*1670–after 1744	Dionysios of Phourna
*c.*1687–*c.*1757	Argenti, Eustratios
1714–1779	Kosmas the Aetolian, St
1716–1806	Voulgaris, Evgenios
1722–1794	Paisy Velichkovsky, St
*c.*1725–1800	Moisiodax, Josephos
1731–1800	Theotokis, Nikiphoros
1745–1821	Gregory V
1748–1833	Korais, Adamantios
1750–1822	Ali Pasha of Ioannina
*c.*1757–1798	Velestinlis, Rigas
1769–1835	Miaoulis, Andreas
*c.*1770–1825	Bouboulina, Laskarina
1770–1843	Kolokotronis, Theodore
1774–1847	Kolettis, John
1776–1831	Kapodistria, Count Ioannis
1778–1864	Soutsos, Mikhail
1782–1827	Karaiskakis, Georgios
1788–1824	Byron, George Gordon, Lord
1790–1823	Botsaris, Markos
1792–1869	Kalvos, Andreas
1795–1877	Kanaris, Constantine
1797–1864	Makriyannis, Yannis
1798–1857	Solomos, Dionysios
1811–1885	Kaftantzoglou, Lysandros
1815–1867	Otho
1815–1891	Paparrigopoulos, Konstantinos
1826–1905	Deliyannis, Theodoros
1832–1896	Trikoupis, Charilaos
1832–1904	Lytras, Nikephoros
1836–1904	Roidis, Emmanouil
1842–1901	Gyzis, Nikolaos
1844–1916	Theotokis, George
1845–1913	George I
1846–1920	Nektarios of Aegina, St
1848–1941	Chatzidakis, Georgios N.
1849–1896	Vizyinos, Georgios
1851–1911	Papadiamantis, Alexandros
1851–1935	Pallis, Alexandros
1852–1921	Politis, Nikolaos
*c.*1853–1938	Sakellarides, John Theophrastos
1854–1929	Psycharis, Yannis
1859–1940	Parren, Callirrhoe
1859–1943	Palamas, Kostis
1863–1933	Cavafy, Constantine
1864–1936	Venizelos, Eleftherios
1868–1922	Constantine I
1870–1904	Melas, Pavlos
1871–1941	Metaxas, Ioannis
1873–1934	Chatzimichail, Theophilos
1876/79–1936	Papanastasiou, Alexandros
1883–1953	Plastiras, Nikolaos
1883–1955	Papagos, Alexandros
1883–1957	Kazantzakis, Nikos
1884–1951	Sikelianos, Angelos
1884–1974	Varnalis, Kostas
1886–1972	Athenagoras
1887–1968	Pikionis, Dimitris
1890–1947	George II
1891–1957	Zervas, Napoleon
1892–1969	Myrivilis, Stratis
*c.*1895–1965	Kontoglou, Photis
1900–1971	Seferis, George
1900 (or 1906)–1975	Onassis, Aristotle
1904–1949	Skalkottas, Nikolaos
1904–1992	Dimaras, K.T.
1905–1945	Velouchiotis, Ares
1906–1994	Ghika
1907–1998	Karamanlis, Constantine
1909–1986	Prevelakis, Pantelis
1909–1990	Ritsos, Yiannis
1909–1996	Niarchos, Stavros
1910–1989	Tsarouchis, Ioannis
1911–1996	Elytis, Odysseus
1913–1975	Doxiadis, Constantinos Apostolou
1913–1977	Makarios III, Archbishop
1916–1995	Gatsos, Nikos
1919–1992	Andronikos, Manolis
1919–1999	Papadopoulos, George
1922–	Xenakis, Iannis
1922–	Cacoyannis, Michalis
1923–1977	Callas, Maria
1924–1984	Chandris, Antony
1925–	Theodorakis, Mikis
1925–1994	Hadjidakis, Manos
1926–1997	Livanos, George P.
1935–	Angelopoulos, Thodoros

NOTE ON TRANSLITERATION

Transliteration is always a problem when dealing with a non-Roman alphabet across such a vast span of time and space, and it is as impossible to please everybody as it is to be consistent within the rules one has set. But, on the principle that good transliteration like good writing is by definition inconspicuous, the aim throughout has been to present the reader with the form of any word which is likely to be the most familiar and least jarring. In general, ancient names have been presented in their "Latin" form (e.g. Thucydides), but medieval and modern names in their "Greek" form (e.g. Alexios I Komnenos). Since a point in time had to be chosen for the switch from "Latin" to "Greek" forms, that (entirely arbitrary) moment is taken to be the death of Justinian I (14 November, 565) who was probably the last Byzantine emperor to speak Latin. Greek is always transliterated into the Roman alphabet. Here again the more usual "ancient" system (e.g. *basileus*) is employed until (simply because a date had to be chosen) 1453 when the switch is made to the "modern" system (e.g. *vasilefs*). Places that have a standard ancient (or English) form (such as Thessalonica or Athens) retain that form throughout. Nevertheless inconsistencies and infelicities are inevitable and we can only crave the reader's indulgence where they occur.

GRAHAM SPEAKE

The Greek Alphabet

Capital	*Lower Case*	*Name*		*Transliteration (pre-1453/post-1453)*
A	α	Alpha	=	*a*
B	β	Beta	=	*b/v*
Γ	γ	Gamma	=	*g* (hard, as in "good")
Δ	δ	Delta	=	*d*
E	ε	Epsilon	=	*e* (as e in "net")
Z	ζ	Zeta	=	*z*
H	η	Eta	=	*e* (as ee in "meet")
Θ	θ	Theta	=	*th*
I	ι	Iota	=	*i*
K	κ	Kappa	=	*k*
Λ	λ	Lambda	=	*l*
M	μ	Mu	=	*m*
N	ν	Nu	=	*n*
Ξ	ξ	Xi	=	*x*
O	*o*	Omicron	=	*o* (as o in "spot")
Π	π	Pi	=	*p*
P	ρ	Rho	=	*rh, r*
Σ	$\sigma\,\varsigma$	Sigma	=	*s* (ς when final letter)
T	τ	Tau	=	*t*
Y	υ	Upsilon	=	*u/f* after *a* and *e*
Φ	ϕ	Phi	=	*ph*
X	χ	Chi	=	*ch* (hard, as in "chord")
Ψ	ψ	Psi	=	*ps*
Ω	ω	Omega	=	*o* (as o in "lone")

BYZANTINE EMPERORS

Constantine I the Great	324–337
Constantine II	337–340
Constans I	337–350

A

Abortion

Like other ethnic groups in the ancient Mediterranean area, the Greeks afforded the community's protection of law after a child was accepted by the father in a naming ceremony called the *amphidromia*. At any time prior to that event the foetus or child could be killed with impunity and usually without adverse moral judgement.

Abortion was practised through both chemical and surgical procedures. The latter was considered more dangerous and, consequently, most of the anecdotal and medical data refer to drugs, usually taken orally. Only after Christianity was established did this cultural pattern change and even then not dramatically. In pre-Christian Hellenic and Hellenistic societies abortion was regarded as a normal exercise of a woman. The exception was the moral and sometimes legal obligation to bear a child in wedlock when the father wanted the progeny. In Christian Greek- and Latin-speaking communities a woman was free to terminate what we regard as an early pregnancy, but not after she declared herself pregnant or when the foetal development made pregnancy obvious.

Contraception, abortion, and infanticide (provided it was before the ceremonial acceptance into the family) were means to limit family sizes as well as to dispose of unwanted, illegitimate, or deformed children. Exposed babies could be given or sold to slave traders. Hesiod (*fl. c.*700 BC) warns families not to have more than one son. Socrates said that midwives – his own mother was one – knew the drugs to "cause miscarriages if they think them desirable" (Plato, *Theaetetus*, 149d). Aristotle spoke of unspecified drugs to prevent children "before sense and life have begun in the embryo" (*Politics*, 7. 14. 10/1335b). In much the same way Plato voiced the same sentiments for public policy in the ideal state to limit unneeded children. A later report that the lawgivers of Athens and Sparta, Solon and Lycurgus, prohibited abortions is not regarded as authentic. Instead it was merely a reflection of sentiments in the 2nd century AD when Galen made the claim.

The medical writings beginning with those attributed to Hippocrates have prescriptions for causing an abortion. Sometimes they were not explicitly stated for an abortion but for stimulation of the onset of menstruation, although the function was to terminate, in our vocabulary, an early pregnancy. Such plants as the rue, pennyroyal, myrrh, juniper, and birthwort (*Aristolochae*) were among those commonly employed. Birthwort was considered suitable for late-term abortions or, similarly, to initiate labour for delayed childbirth.

The modern question of "when does life begin" was not formulated in ancient Greek society with the meaning we give to it. Plutarch said that Plato regarded the foetus as a living being, but nevertheless Plato recommended abortions for women over 40. Aristotle's biological observations on foetal development, mostly observed with birds' eggs, influenced later Christian theological thinking. Knowing that an accident or Caesarian birth can result in a live birth, Aristotle asked when the foetus developed independent life. Although he did not consistently answer the question in the same way, one of his answers heavily influenced later philosophical and religious attitudes towards abortion. When the foetus had all of its form, Aristotle said that it had *psyche*, meaning "life". The Stoics developed the notion of "soul" for which they employed the word *psyche*. The Christians, when reading Aristotle, thought that his question was not when independent life was expected but ensoulment. The only explicit reference to abortion in the Bible or Torah occurs in Exodus 21: 23 in answer to a question about the fault of a person assaulting a pregnant woman with a miscarriage resulting. The answer was "life is for life". The Hebrew word for life, *nefesh*, was translated by the Septuagint as *psyche*, thus the implication in late, Classical Greek to give a "soul for a soul" as punishment for the act. Most of the Church Fathers adapted Aristotle's views and believed that ensoulment came at that point in a pregnancy when there was foetal movement. They envisioned the soul to have come from God, not the parents, and the divine act came when the foetus was formed. Prior to ensoulment a woman was free to terminate her fertility by returning to her menstrual cycle.

Not all pre-Christian or pagan Greeks subscribed to faultless abortion. For example, a Greek inscription above a sanctuary in Lydia (north Africa) prohibits entry to those who commit contraception, abortion, or infanticide. In its early version the Hippocratic Oath forbade a physician from prescribing an abortive pessary. The 2nd-century AD gynaecology writer Soranus explained that pessaries were more dangerous than oral-route drugs, and thus to be avoided. By late Hellenistic and Roman periods, however, some versions of the oath excised the word for pessary, thereby alleging that a physician was prohibited from the administration of any kind of abortion. Probably no version of the oath was actually taken

by physicians in ancient or Byzantine times, but physicians were no doubt aware of the ethical values espoused.

The Stoics asserted that life began with the taking in of the first breath of cold air, but some Stoics argued that the foetus had the potential for life. No writings of Greek Stoics speak directly on abortion, but later Stoics asserted that intercourse should only be for procreation. Writing in the late 3rd century, Porphyry discussed the question of when the soul enters the new being and answered that it may be as early as when the sperm enters the womb. Porphyry's answer (among others he proposed) was not accepted in Greek culture until the latter part of the 19th century.

In the Hellenistic and Byzantine periods some modifications were made to the ancient formula regarding abortion after foetal formation. The Gnostics regarded intercourse of any kind under any circumstances as wrong. The hateful *pharmakia* ("drugs") in biblical and early Christian works (e.g. Galatians 5: 20 and *Didache*, 5. 1) are oblique references to abortifacients.

Generally the Greek Church Fathers took a stronger position against the termination of pregnancy at any time than did the Latin Fathers. Gregory of Nyssa (d. *c.*395) followed the Latin approach in saying that an unformed (i.e. prequickening) foetus could not be considered a human being. His elder brother Basil (d. *c.*379) spoke harshly against women who "destroyed a foetus ... whether ... formed or unformed". A feticide is the same as homicide; but he mitigated the punishment and recommended compassion and a lesser repentance if circumstances merited it. Essentially the Eastern Orthodox Church adopted as canonical the pronouncement by Basil. Arethas of Caesarea (9th–10th century) and Michael Psellos (11th century) held similar views. Since the Renaissance the Greek Orthodox Church has had a more consistent position compared with the Roman Catholic Church regarding birth control. Essentially the Greek Church rejects any artificial intervention in procreation. In the 20th century, however, it has modified its position on contraception but not on abortion.

Discontinuity existed between Greek medieval religious doctrine and practices, if medical works and legal codes are to be accepted as reflecting actual practice. Those medical works that were based on Classical, Byzantine, and borrowed Arabic authorities all continue prescriptions for abortifacients, most of which were effective. Some were disguised as menstrual stimulators, ostensibly to return to menstruation, but they caused an abortion should pregnancy have been the reason for delay. Procopius, writing in the 6th century, spoke of the empress Theodora employing abortifacients. Justinian's *Digest* protected a male's right to have a child sired in wedlock. Later Byzantine law inflicted capital punishment for widows who killed foetuses for money. Gradually the tolerance for abortion became more restrictive in Greek as well as Latin lands. The 14th-century *Hexabilos* identified suppliers of abortion drugs as murderers. A famous case in 1370 found guilty the father (in this case, a monk) of an unborn child for administering an abortion and sent into exile the physician who supplied the drugs.

Academy of Athens

Philosophical school founded by Plato

The Academy was a public gymnasium in Athens, sacred to the hero Academus. It was located northwest of Athens, near the Dipylon gate. Plato founded his school there about 388/87 BC when he returned to Athens from his travels in Sicily. He acquired a house with a garden where Mithridates later set up a statue of him and where Speusippus, Plato's nephew and successor, erected statues of the Muses. We do not know much about the organization and legal status of the Academy. Although Plato was not the first to found a school of secondary education in Athens, his school had certain distinctive characteristics. Membership of the Academy was not the exclusive privilege of the few; nor did it presuppose adherence to certain doctrines. Plato did not charge his students – who included women – a fee. Mainly responsible for the teaching was the scholarch, but other senior members could lecture too. Subjects taught, apart from philosophy, included mathematics, astronomy, and natural science. An insight into the activity of the Academy is offered by a fragment of the comic writer Epicrates (4th century).

Unlike the founders of other schools (Socratics, sophists), Plato made provision for the continuation of the school after his death (347 BC), by appointing Speusippus as his successor. His school was maintained until the 1st century BC, enjoying an unbroken line of elected successors. Already the ancients distinguished two main phases in the history of the Academy: (1) the Old Academy from Speusippus to Crantor, and (2) the New Academy from Arcesilaus to Philo of Larissa. Later, doxographers make further divisions, often distinguishing four or five phases. The first phase is that of doctrinal Platonism, whereas with Arcesilaus (316–240 BC) the Academy enters a period of scepticism which gradually became less radical. Unfortunately not a single extant work survives from Plato's successors. Thus our knowledge of the development of Platonic philosophy is often shadowy. Figures who were regarded as crucial for later developments such as Polemo (scholarch 314–276 BC) remain entirely obscure to us. Yet our knowledge of the succession is firm thanks to a variety of ancient sources, notably a papyrus from Herculaneum (*Index Academicus*).

Speusippus had a strong interest in logic and mathematics. He elaborated Plato's theory of division and developed a theory of definition. Speusippus argued for the separate existence of numbers as immutable and eternal objects of knowledge preferable to Plato's ideas. He admitted two opposite principles: the One and the multiplicity. Yet these principles are not universal for the several kinds of substances, but each of them has its own principles. In Aristotle's view this lack of ultimate principles deprives the world of internal order and fails to account for a final cause. As regards ethics, Speusippus maintained that both pleasure and pain should be avoided as they are disturbances. Xenocrates (scholarch 339–314 BC), as we can infer from his list of writings, had a strong interest in moral philosophy, while he was also interested in giving a systematic account of the nature of gods and demons and their relation to heavenly bodies. With Polemo the interest in moral questions predominates. Crates and Crantor apparently continued Polemo's line. Crantor became renowned for his treatise "On Grief" and for composing the first commentary on a Platonic dialogue, namely the *Timaeus*.

The term "New Academy" bears a critical overtone. It was first coined by Antiochus of Ascalon (1st century BC) in order to criticize the sceptical Academy as diverging from a dogmatic Plato. Arcesilaus introduced scepticism into the Academy appealing to Socrates' aporetic method. The aim now was to challenge dogmatic doctrines dialectically. Neither Arcesilaus nor his most important successor Carneades (*c.*214–129 BC) wrote anything; their positions were expounded by their successors, Lacydes and Clitomachus respectively. Arcesilaus questioned Stoic claims that firm knowledge is attainable through sense impressions, arguing that no sense impression is such that it cannot be false. Arcesilaus' alternative to holding mere beliefs was to postulate suspension of judgement as the safest way to avoid error. Carneades systematically questioned dogmatic arguments, insisting on the impossibility of distinguishing cognitive from non-cognitive impressions. He maintained that suspension of judgement still allows for action; we can follow plausible impressions, but we do not have to assent to them.

Philo of Larissa was to be the last scholarch of the Academy. He succeeded Clitomachus around 110 BC, but with the occupation of Athens by Sulla in 89/88 BC he fled to Rome where he continued to teach for about a decade until his death. Philo started as a faithful follower of Carneadian scepticism, but later he reinterpeted it as allowing for formation of philosophical judgements. He maintained that things are actually knowable but we lack a criterion of truth such as the Stoic one, and he argued that this position was being held in the Academy all along, thus presenting the early Academic scepticism of Arcesilaus and his followers as being a reaction to Stoic dogmatism. Antiochus, Philo's disciple, found Philo's new position infuriating. He withdrew from the Academy, reproaching the "New" (i.e. sceptical) Academy as an aberration of Plato's philosophy. He himself propounded the revival of the "Old" Academy, claiming adherence to the ancients. Interestingly Antiochus included among the ancients Aristotle and the early Peripatetics, and argued for an essential agreement between the Academy and the early Peripatos. He also thought that the Stoics were in many respects in accord with the ancients exactly because they borrowed so much from them, only modifying their terminology. Yet Antiochus failed to restore the Old Academy. His philosophical outlook was heavily Stoic; his epistemology was essentially Stoic and his ethics more Peripatetic than Stoic. Antiochus never became scholarch of the Academy; he taught in his own school in the Ptolemaion gymnasium in Athens, while the Academy was abandoned after Sulla's sack of Athens. Antiochus' own school did not last long either.

There is no evidence of any philosophical activity in the Academy in the subsequent centuries. The term "Academic" now meant "sceptic", contrasted to "Platonic" which first applied to Thrasyllus (1st century AD), the editor of Plato's works in tetralogies. Plutarch, however, tried to restore the original meaning of the term "Academic" and defended the aporetic character of Plato's thought. A formal institution of Platonism no longer existed and there were no successors of Plato. Individual Platonists taught their students in their own schools, located either in a gymnasium or in their own house. This was the case with Ammonius and his disciple Plutarch (1st century AD) and also with Taurus (2nd century). In AD 176 the Roman emperor Marcus Aurelius set up chairs for teachers of philosophy in Athens, and Atticus was probably the first incumbent of the Platonist chair. Plotinus (3rd century AD) taught in Rome in an establishment provided by a rich patron, while later Neoplatonists taught in Alexandria, Syria, and Athens. The Athenian school of Neoplatonism established successions. Proclus (5th century) claimed descent from Plato; and Damascius (6th century) argued for an unbroken "Golden Chain" of successors from the time to Plato to himself. But this was a historical illusion propagated by the Athenian Neoplatonists to lend authority to their own school, which was not located in the gymnasium of the Academy. The closure of the Academy by Emperor Justinian in 529 did not stop all philosophical activity. Simplicius and Olympiodorus wrote most of their works after that date.

Summary

Philosophical school in Athens founded by Plato *c.*388/87 BC. Subjects taught included mathematics, astronomy, and natural science as well as philosophy. Known as the "Old" Academy from Speusippus to Crantor (*c.*269 BC) and the "New" from Arcesilaus to Philo of Larissa (in the latter phase dogmatic Platonism was abandoned in favour of scepticism), the school was deserted after Sulla's sack of Athens in 88 BC.

Acarnania

Region in western Greece

The Ambracian gulf and the Ionian sea formed Acarnania's northern and western borders, while its border with Aetolia, to the east and south, was less stable. Mount Thyamus and the Achelous river, however, are usually considered the limits of the ancient Acarnanian state. Its most populous region was the plain of the Achelous, commanded by the town of Stratus. The increased excavation activity in Acarnania contributes to a more precise definition of its historical outline. However, issues concerning the provenance of its earliest inhabitants, the role they played in Greek history, and the development of its political institutions are still insufficiently understood due to the small number of comprehensive studies dealing with the region.

Little is known about Acarnania before its colonization by the Corinthians in the 7th century BC; in epic poetry there are references to the region, though without mentioning its name, as the kingdom of the cruel king Echetos. Information on the prehistoric inhabitants of Acarnania, the Taphians, Teleboans, Leleges, and Kouretes, is also vague. It seems that the region was not heavily populated in the Bronze Age; all the sites of this period are located in the region of Astacus, while there is a remarkable absence of Bronze Age sites along the coast.

The Acarnanians of the early historical period moved into the region at the time of, or a little after, the Dorian migration and spoke a northwest Greek dialect, characteristics of which have been traced to Illyria and Epirus. Before the arrival of Corinthian colonists, there was a settlement at Oeniadae. According to a myth narrated by Thucydides, an oracle directed Alcmaeon, Amphiaraus' son, to establish it after his act of matricide. Thus Alcmaeon became the first ruler of this area and his son Acarnan gave his name to the people. The Corinthians colonized primarily the northwest of the territory (Leucas, Anactorium, Sollium) despite native opposition. Consequently, Corinthian artistic influence has been observed in Acarnania during the Archaic period.

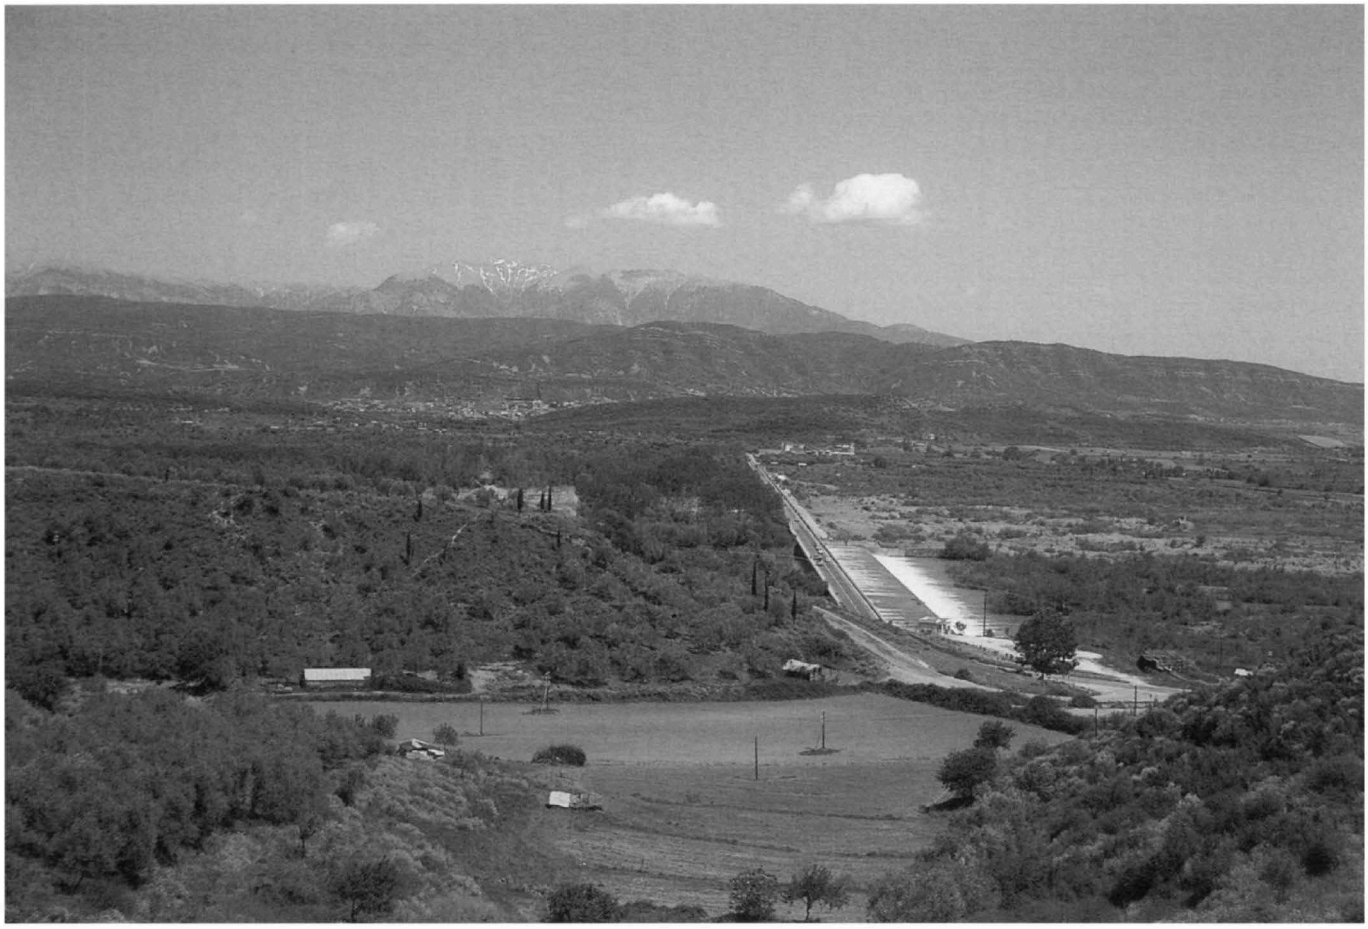
Although Acarnania as a whole did not play an active role in the events of the Greek world, at least until the 4th century BC, it was involved in many wars because of its strategic position along the western sailing route to Italy. It was only the Corinthian colonies, Leucas, Anactorium, and Ambracia, which parricipated in the Persian Wars, sending contingents to Salamis and Plataea. In the middle of the 5th century BC contacts between Acarnania and Athens were developed, as the latter began to expand its sphere of influence in the west of Greece. With the aid of Athens the Acarnanians managed to subdue the Corinthian colonies on their coast. Being in alliance with Athens, they became involved in the Peloponnesian War and sent forces to Sicily in aid of Demosthenes.

By the mid-5th century BC the notion of *ethnos* (nation) existed among the Acarnanians as is demonstrated by the common defence of towns in cases of external attack. The individual poleis were organized into a federal state, the Acarnanian *koinon*, but they retained their autonomy. Each of them contributed troops for the defence of Acarnania, while an official body was located at Stratus from the 4th century BC. The earliest coins of the federal state were issued around 350 BC. The economy of the region was still agriculturally based in the 5th century BC; the production of grapes, olives, wheat, and barley and the keeping of livestock served local consumption, while there are no indications of interstate trade on a regular basis. The strong commercial presence of Corinth is reflected in the adoption of Corinthian coinage from the end of the 6th to the 3rd century BC.

In the Corinthian war (395 BC) Acarnania sided with Athens and its allies against the Lacedaemonians. In 390 BC the Spartan king Agesilaus II attacked Acarnania, which consequently allied with Sparta. Under the threat posed by Philip II of Macedon, the Acarnanians joined the second Athenian Confederacy and fought against him at Chaeronea (338 BC). Macedonia, however, soon replaced Athens as the Acarnanians' ally and protector, especially against Aetolia.

An Acarnanian–Macedonian alliance was encouraged by Cassander in 324 BC, in order to prevent Antigonus' activity in Aetolia which threatened the Macedonian ruler. In 314 BC the Acarnanian communities near the Aetolian border agreed to concentrate in the larger cities. In 294 BC Alexander IV ceded some rights over Acarnania to Pyrrhus in return for military assistance. During the years of Pyrrhus' rule Acarnania was prosperous because of the flow of trade from Greece to south Italy and Sicily and the temporary peace with Aetolia. This peace did not last long and frontier disputes with the Aetolians resulted in the dissolution of the Acarnanian *koinon* and the partition of Acarnania between them and the Epirotes around 252–250 BC.

In 231 BC, after the end of the war between Aetolia and Macedonia (239–234BC), the Acarnanians managed to regain control of their territory and a year later to reestablish their league. They acquired from Epirus the island of Leucas which became their capital. The main target of the new federation's policy was the liberation of the Acarnanian communities under Aetolian control. Antigonus Doson and Philip V supported the league. In 219 BC Philip campaigned along the



Acarnania: looking east from Stratos across the valley of the river Archelous

Aetolian–Acarnanian border and recovered Phoetiae and Oeniadae. At the end of the summer in 217 BC peace was agreed between Philip and the Aetolians at Naupactus.

The Acarnanians sided with Philip against Rome (200 BC) and as a result Leucas was separated from the *koinon* and Thyrreion became the new capital. The Acarnanian confederacy survived until 31–29 BC, but the coastal cities suffered from pirate raids and the whole region from the Roman civil wars. Following the battle of Actium (31 BC) the country was ravaged by Octavian, and its inhabitants settled in Nicopolis (founded 30 BC.)

From Byzantine to modern times Acarnania and Aetolia have shared a common history and development. The region became part of the theme of Nicopolis and then of the despotate of Epirus. Their ancient names, however, were occasionally in use until the 6th century AD. Acarnania took a prominent part in the national uprising of 1821 against Turkish domination and since 1833 has been joined with Aetolia as a nome.

Summary

Region of western Greece colonized by the Corinthians in the 7th century BC. With the aid of Athens the Acarnanians expelled the Corinthians in the 5th century BC and formed a federal state or *koinon*. Allied in turn with Athens, Sparta, Athens again, and Macedonia, Acarnania suffered constant friction with neighbouring Aetolia. The confederacy survived until 29 BC when the region was laid waste by Octavian.

Achaea

Region in the Peloponnese

Achaea is located in the northwest of the Peloponnese, between Elis and Sicyon, in the restricted land space between the Corinthian Gulf and the mountains. The region is relatively well watered and wooded, especially in its southern portion. Its three highest peaks, Panahaiko, Erimanthos, and Aroaneia, all located in the south, are dotted with numerous attractive villages. Coastal towns in the north are separated by small bays.

Evidence for early settlement in the region includes material remains from the Neolithic, Middle Helladic, and Late Helladic eras. Vestiges of Mycenaean occupation are found in both textual accounts and archaeological data. According to Homer (*Iliad*, 2. 574) Aigion, east of Patras, was part of Agamemnon's territory. And, indeed, archaeological discoveries at Aigion include a fairly extensive Late Helladic necropolis. Pausanias reported a variety of stories connecting the region with ancient Mycenaean, Dorian, and Ionian traditions. According to his description of the upheaval following the decline of the Mycenaean centres, the local "Ionians" moved from Achaea to Attica while "Dorians" from Argos and Sparta moved into the area. Originally named "Aigialea", the region received its Classical name Achaea after the arrival of the Dorian settlers. Herodotus (1. 145) gives us the names of the twelve main parts, *merea*, or cities in Achaea: Aegae, Aigion, Aegira, Bura, Dyme, Helike, Olenus, Patras, Pellene, Phareae, Rhype, and Tritaeae. These cities (or regions) formed a religious and military alliance known as the First Achaean League, which lasted until the late 4th century BC. Of these cities, several gained particular importance: first Helike, then Aigion, was the meeting place of the Achaean League; and Patras (named after Patreas, chief of the Achaeans) very early on became and remained a vital economic centre.

Achaea did not play a leading political role for most of Archaic and Classical antiquity, but it did play an important part in colonial settlement in south Italy, where Achaeans founded several cities including Sybaris and Croton. Achaea also maintained political ties with other Peloponnesian states and was occasionally considered by these neighbours as a means to increase their own power. Hence, in an effort to strengthen their influence in the Peloponnese, the Spartans transferred the bones of Teisamenos (a pre-Dorian hero and son of Orestes) to Sparta. Though the Delphic oracle had reportedly ordered the transfer, the move did not ultimately strengthen the ties between the two states.

Achaean involvement in some of the greatest events in Classical Greek history seems to have been limited. Achaeans did not participate in the Persian Wars (at least neither the Spartan nor the Athenian ally lists mention the Achaeans). And while the region became strategically important during the Peloponnesian War, it only occasionally played an active role in it, as in the Athenian and Achaean battle against the Corinthians in the harbour of Patras in 429 BC.

During the 4th and 3rd centuries Greece was politically unsettled and so Achaea's importance grew, since Achaean cities had largely maintained their democratic institutions (only Pellene had ever been ruled by a dictator or tyrant) and maintained strong league alliances. Except for the earthquake that destroyed Helike in 373 BC, the Achaeans experienced relative stability after the Peloponnesian War. Treaties with the Achaean League, therefore, became an important part of the foreign policy of several states. Epaminondas of Thebes (in 366 BC), for instance, led troops into the Peloponnese and entered Achaea hoping to make an alliance and thereby check Arcadia's political strength. He easily won an alliance there, but it did not last because the Thebans unwisely decided to overturn the local governments. Resistance and revolt resulted, causing the Thebans to lose Achaea, and drawing Sparta and Achaea into a short-lived, but close, association. As Macedonian influence grew, the Achaean League responded with policies opposed to Philip II, but with little longterm effect. Philip and his superior troops changed Greek politics for ever. Macedonians would remain dominant in Greece and Achaea until the coming of the Romans. Indeed, even after the death of Philip's son, Alexander the Great, the Antigonids (the dynasty founded by Antigonus I) took control of the region and in 303 BC parts of Achaea were held by Demetrius Poliorcetes (son of Antigonus I).

Twenty years after the Macedonians dissolved the First Achaean League, the Second Achaean League was created (280 BC). The new league was much more inclusive than its earlier version, and by the mid-3rd century it was led by Aratus of Sicyon. Aratus continued the anti-Macedonian tradition – keeping Achaea out of the Roman–Macedonian wars. This course initially benefited league members in their relations with the increasingly powerful Romans. Thus, as a result of these policies, the Romans brought most of the Peloponnese under the control of Achaea. Nevertheless, close Roman–Achaean ties were soon disturbed due to Roman interference in league affairs and their insistence that Sparta be released from the league. The Spartans had grown opposed to Achaean League power and, when forced to join the confederation, resented league treatment of them. (The Achaeans had torn down the walls of Sparta and disrupted traditional educational practices.) Sparta appealed to the Roman Senate for aid in their conflict with the league. Attempts at arbitration, influenced by a series of misunderstandings, favoured Sparta, resulting in the Achaean war (146 BC), the temporary dissolution of the league, the destruction of Corinth and Patras, and a permanent Roman presence in the region. By 31 BC Octavian made Achaea just another part of the Roman province of Achaea.

There is abundant evidence for vital religious traditions in Achaea throughout its history. Numerous temples, shrines, and sanctuaries dot the landscape. Achaean coins bear the likeness of Poseidon and Athena. In Pellene Pausanias saw a statue to Athena reportedly created by Phidias. He also mentioned an "infallible" oracle for the sick, located at a spring near Patras. The church of St Andrew was later built at the same site, and the waters there were considered to have miraculous powers well into the 19th century. Inhabitants of the region embraced Christianity somewhat earlier than the rest of Greece, in part, perhaps, because St Andrew preached in Patras and was martyred there. Early Christian conversion was accompanied by the urge to build churches, chapels, and monasteries. Not surprisingly, therefore, many early Christian sites can be found in Achaea. One of the region's oldest intact Christian buildings is the monastery of Makellaria, where an inscription claims that the structure was built by Belisarius (d. 565), general of Justinian I.

During the Slav migrations, Achaea received a new influx of Christianized people, particularly from the 6th to the 9th centuries. Over time these Slavic people quietly assimilated Greek culture and language while Achaea again sank into relative political insignificance. However, like other regions in Greece, there was a quickening of political and economic activity during the 9th century and soon thereafter Achaea would become a prize to be won during western Europe's crusading years. In 1205 the region again occupied centre stage with the founding of the principality of Achaea by the Franks (which included the region of Achaea and most of the Peloponnese or "Morea"). By the end of the 13th century parts of central Greece were once again in Byzantine hands, but the principality of Achaea remained under the control of the Franks. Later it passed into the hands of the Palaiologos family, then to the Turks in 1460. Between 1687and 1715 the area was part of a Venetian colony. On 21 March 1821 Germanos the archbishop of Patras called for "freedom or death" from the monastery of Hagia Lavra, originally constructed in AD 961. A revolutionary banner was raised in the monastery garden and, after fierce fighting, the region was finally liberated in 1828. Nowadays the small coastal and mountain villages in Achaea are popular among tourists for their picturesque qualities and their ancient and medieval monuments, while Patras is the largest city in the Peloponnese, the capital of the region, and is again among the most important transportation centres in Greece.

Summary

Region in northwestern Peloponnese. Achaea was settled in the Neolithic period and has fairly extensive Mycenaean remains. Its cities formed a federal state which became politically significant during the Peloponnesian War and remained so until the Roman period. Its principal town Patras was the centre of a Frankish principality of Achaea for two centuries after 1205.

Achilles Tatius

Novelist of the 2nd century AD

Achilles Tatius wrote the novel *Cleitophon and Leucippe*, probably in the 2nd century AD. The *Suda* credits him also with works on etymology, on remarkable people, and on astronomy; but the third of these works, entitled *On the Sphere*, may belong to a different Achilles. Photios, Eustathios, and the *Suda* refer to him as an Alexandrian. The report in the *Suda* that he became a Christian bishop is doubtful, and nothing certain is known of his life.

The eight books of his novel set forth the romantic adventures of a young Greek couple, a youth from Tyre and a maiden from Byzantium. The historical setting appears to be the Hellenistic age, but no precise dates are indicated. The narrator of the tale is the hero himself. The tone fluctuates considerably, as passion and drama alternate with wit and farce. The first portion of the novel describes how Cleitophon woos Leucippe while she and her mother are residing as guests in his father's house. To escape the suspicions of Leucippe's mother, the lovers run away and set sail for Alexandria. When a storm destroys the ship, Cleitophon and Leucippe land together on the coast of Egypt and are captured by an army of bandits, who plan to sacrifice Leucippe; but the hero and heroine are soon rescued. They travel to Alexandria and then Pharos, where Leucippe is abducted by a zealous admirer and a gang of brigands, who dupe their pursuers into believing that Leucippe is dead. Several months later Cleitophon reluctantly agrees to marry Melite, a young widow who has fallen deeply in love with him. They journey to her home in Ephesus to be wed, and there Cleitophon discovers that Leucippe is still alive and working as a slave on Melite's estate. Melite's husband Thersander, previously presumed dead, now returns to Ephesus. Incited by the wicked servant Sosthenes, he imprisons Cleitophon on a charge of adultery and develops a passionate

lust for Leucippe, but his schemes are eventually foiled. Leucippe and Cleitophon return home to be married.

Like the other ancient Greek novels, Achilles Tatius' work is written in Atticist prose, that is, with vocabulary and syntax imitating those of Athenian prose authors of the 5th and 4th centuries BC. Substantial portions are highly artificial in style, reflecting the literary tastes of the Second Sophistic: for example, strings of two- and three-word phrases often interrupt the regular flow of the prose; adjacent sentences may reflect one another syntactically and rhythmically.

Achilles employs several dramatic and rhetorical elements common to the Greek novels. In addition to engaging in frequent, often witty dialogue, the characters delight in making speeches. Cleitophon and his friend Clinias debate at length the relative merits of love for boys and love for women (2. 35–38); Melite pleads passionately and eloquently when attempting to seduce Cleitophon (5. 25–26). The artificial language is concentrated in such passages, the argumentation elaborate and sometimes facetious. Achilles also exercises his rhetorical skills in copiously detailed descriptions of events and physical objects: a ship wrecked by a storm (3. 1–4), a hippopotamus (4. 2) and an elephant (4. 4), the city of Alexandria (5. 1). Particularly striking are the several descriptions of works of art, or *ekphraseis* (cf. Philostratus' *Imagines*), the most celebrated of which features a painting of Europa and the bull; situated at the opening of the novel, the lavish visual description of the maiden's abduction announces love and travel as major themes of the ensuing narrative. Other notable rhetorical elements include Achilles' theoretical discourses on the physical mechanisms and psychological effects of emotions and sensations: how kisses give pleasure (2. 8), how rage and anger may vie for control over the soul (6. 19).

Unique among the ancient Greek novels is Achilles' use of a first-person narrator, a technique that offers the reader an intimate and emotionally charged account of events and enhances the characterization of the hero. Like the first-person narrators of the pseudo-Lucianic *Ass* and Apuleius' *Metamorphoses*, Achilles' narrator sometimes appears naive, sentimental, or comic. He occasionally presents himself as an object for mild mockery, as when he is duped into thinking Leucippe dead and pitiably laments her loss (3. 16, 5. 7, and 7. 5), and when he dresses in Melite's clothing to escape Thersander (6. 1–5).

Like his fellow novelists, Achilles attaches considerable importance to the heroine's chastity. Leucippe is instructed by Artemis in a dream to preserve her virginity (4. 1), and in the final book a magical test at the temple of Artemis at Ephesus gives public proof of it (8. 6, 8. 13–14). Achilles' other characters, however, are not subject to the same scrutiny.

Achilles makes liberal use of the mythological and literary tradition. The narrator and other characters, for example, introduce myths as subjects of *ekphraseis* and as exempla in argumentation. Melite playfully likens Cleitophon dressed in women's clothing to Achilles in disguise at the palace of Lycomedes. The characters also quote and allude to a range of authors from the Archaic, Classical, and Hellenistic periods, including Homer, Hesiod, Aristophanes, Plato, Herodotus, Demosthenes, and Theocritus. While portraying the characters as educated and urbane, such references also suggest that Achilles wrote for a sophisticated reading public.

Several papyrus fragments of the novel attest to its popularity from the 2nd to the 4th centuries AD. Achilles was again read and admired in Byzantine times. Photios and Michael Psellos comment on his faults and his merits. Achilles was a major influence on the 12th-century novelists, particularly on Eustathios Makrembolites, whose *Hysmine and Hysminias* borrows many features of Achilles' plot, including the flight of hero and heroine from home, the shipwreck, and the chastity test. Makrembolites also adopts Achilles' first-person narrative and shows a similar fondness for visual description and the analysis of emotions.

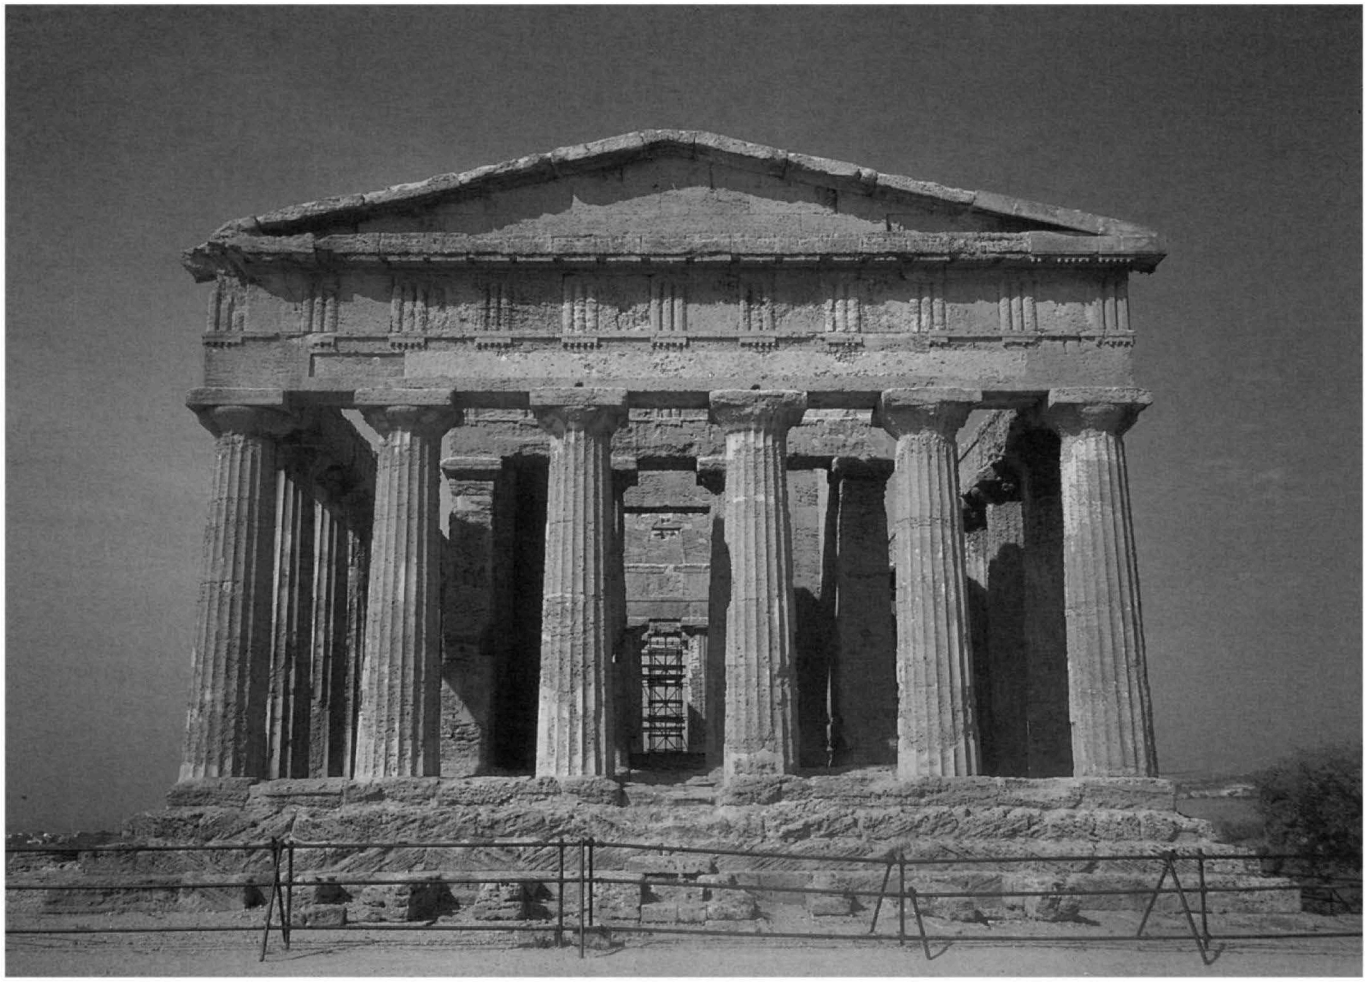
Acragas

City in Sicily

Acragas (Agrigentum in Latin, Girgenti in Italian, then renamed Agrigento after its Latin name by Mussolini; today a provincial capital with about 55,000 inhabitants) was founded four km inland from the southwest coast of Sicily about 582/81 BC by the city of Gela and its Greek mother city Rhodes; the site, steeply rising on three sides, provided a natural fortress. Called "the most beautiful of cities" by Pindar (*Pythian* 12. 1), Acragas' importance already in the 6th century BC is confirmed by the legends about the tyrant Phalaris (560 BC), who built a fortification and widened the city's sphere of influence. At the beginning of the 5th century BC another tyrant, Theron, seized power and made Acragas the second most important city of Sicily; together with his son-in-law Gelon of Syracuse, he defeated the Carthaginians at the Himera river in 480 BC. The rich booty (including 25,000 prisoners of war) provided the means for an enormous building programme, the impressive remains of which can still be seen in the so-called "Valley of temples".



Acragas: the Temple of Concordia, built *c.*430 BC

This term for what is a unique archaeological site is somewhat misleading, as most of the temples are standing on the hilltops along the town wall, so as to be seen clearly from the sea. Similarly, most of the modern names of the temples are not backed up by ancient evidence. The easternmost "Temple of Juno Lacinia" (a peripteros of 6 × 14 columns) was built in the middle of the 5th century BC; it measures 38.10 × 16.91 m, which is relatively small in comparison with other Sicilian temples. It was restored several times in the Roman era, but fell into decay afterwards and was rebuilt in 1785, from then on inspiring numerous paintings and engravings (e.g. by Caspar David Friedrich). The "Temple of Concordia" (named after a Roman inscription found nearby but unconnected with the building) was built about 430 BC. It is one of the best-preserved Greek temples anywhere, because in the 6th century AD it was transformed into a Christian church; most of the Christian refurbishments were removed during the restoration of 1785. Like most of the Classical temples in Sicily it is rather small (39.42 × 16.92 m) and has a peristyle of 6 × 13 columns. A third temple, dedicated to Heracles (this is confirmed by Cicero's description), lies further west along the town wall. Measuring 67 × 25 m, it is the largest and earliest Doric peripteral temple at Acragas, constructed at the beginning of the 5th century BC during Theron's reign, on the site of a previous temple, as excavations have shown. Its architecture shows the transition from Archaic to Classical times: the cella has a pronaos, inner sanctuary, and open opisthodomos, and for the first time the closed adytum that was in use in the region before is lacking. According to Cicero the temple contained a bronze cult statue by the Athenian sculptor Myron (5th century BC) and a painting of Heracles killing the snakes by the famous painter Zeuxis of Heraclea (end of the 5th century). North and west from this temple was the site of the ancient city with its agora (only slight traces remain) and the main gate; beyond the city wall are large necropoleis, and at some distance the ruins of a temple of Asclepius (middle of the 5th century BC).

To the west of the city gates lie the impressive ruins of the Temple of Olympian Zeus, a unique example in Greek architectural history. This Olympieion of gigantic size (56.30 × 113.50 m) was put up by the Carthaginians taken prisoner in 480 BC (though never finished). Unlike other temples, it had no freestanding peristyle, but closed walls, on the outward side of which there were 7 × 14 half-columns (about 20 m high), and between them colossal Atlas figures apparently weighed down by the upper part of the temple – an eloquent symbol of the defeat suffered by the Carthaginians. Inside was an immense hall of pillars consisting of three aisles, the middle of which was open to the sky; these peculiar architectural features were taken over from the Phoenician-Carthaginian world and in this way symbolically "imprisoned" within Greek architecture.

To the west of the Olympieion lies the sanctuary of the Chthonian gods, originally of the 6th century, but greatly enlarged during the 5th; it contained several small buildings and numerous altars, the purposes of which are not yet entirely clear. Another two Doric temples were built next to it in the 5th century. Standing in the northwest corner is the so-called "Temple of the Dioscuri", today one of the landmarks of Acragas. It was heavily restored in the 19th century according to people's imagination of how it should look and by mixing remains of the 5th-century BC structure with those of its first restoration in Hellenistic times. Next to it is "Temple L", slightly larger (17.20 × 38.80 m) and today almost completely destroyed. On the western side of this precinct a large artificial lake (probably constructed under Theron) once formed the water reservoir of the city, but is now a steeply descending valley; beyond are the ruins of the Temple of Hephaestus, the last one built by the city (probably at the end of the 5th century) and unfinished.

After the fall of the tyrants in the early 460s BC, Acragas had a kind of democratic government, in which the city's most prominent son, the philosopher Empedocles, seems to have played a role. A massive Carthaginian offensive at the instigation of Segesta (from 409 BC onwards) brought an end to Acragas' might and prosperity; in 406/05 BC the cities of Selinus, Himera, and Acragas fell before this onslaught. In Acragas the revengeful Carthaginians totally destroyed the Temple of Olympian Zeus; furthermore, the city had to demolish its walls and to pay heavy reparations; it never again fully recovered from this blow. In the 4th century BC Timoleon led a new colony to the almost deserted place and Acragas enjoyed a brief revival under the tyranny of Phintias (286–280 BC). In the Punic wars, however, the city again suffered heavily: it was taken successively by the Romans (261) and the Carthaginians (255), and when it fell in 210 BC as the last Carthaginian outpost in Sicily, the whole population was enslaved by the Romans (who soon, however, brought in Sicani as colonists). In the 1st century BC the city regained some importance because of its agricultural production, and accordingly it suffered under Verres' plundering of Sicily (73–71 BC). In Byzantine times it dwindled to a small village, which after the Arab conquest of 827 grew again and – now being called Kerkent/Gergent – became the centre of the Arab population in Sicily. Today's Agrigento covers only the acropolis of the much larger Greek city.

Summary

A city in Sicily, founded in 582/81 BC by the city of Gela and its mother city Rhodes. Acragas flourished in the 5th century BC and was the home of the philosopher Empedocles. It is famous today for its sequence of well-preserved Doric temples.

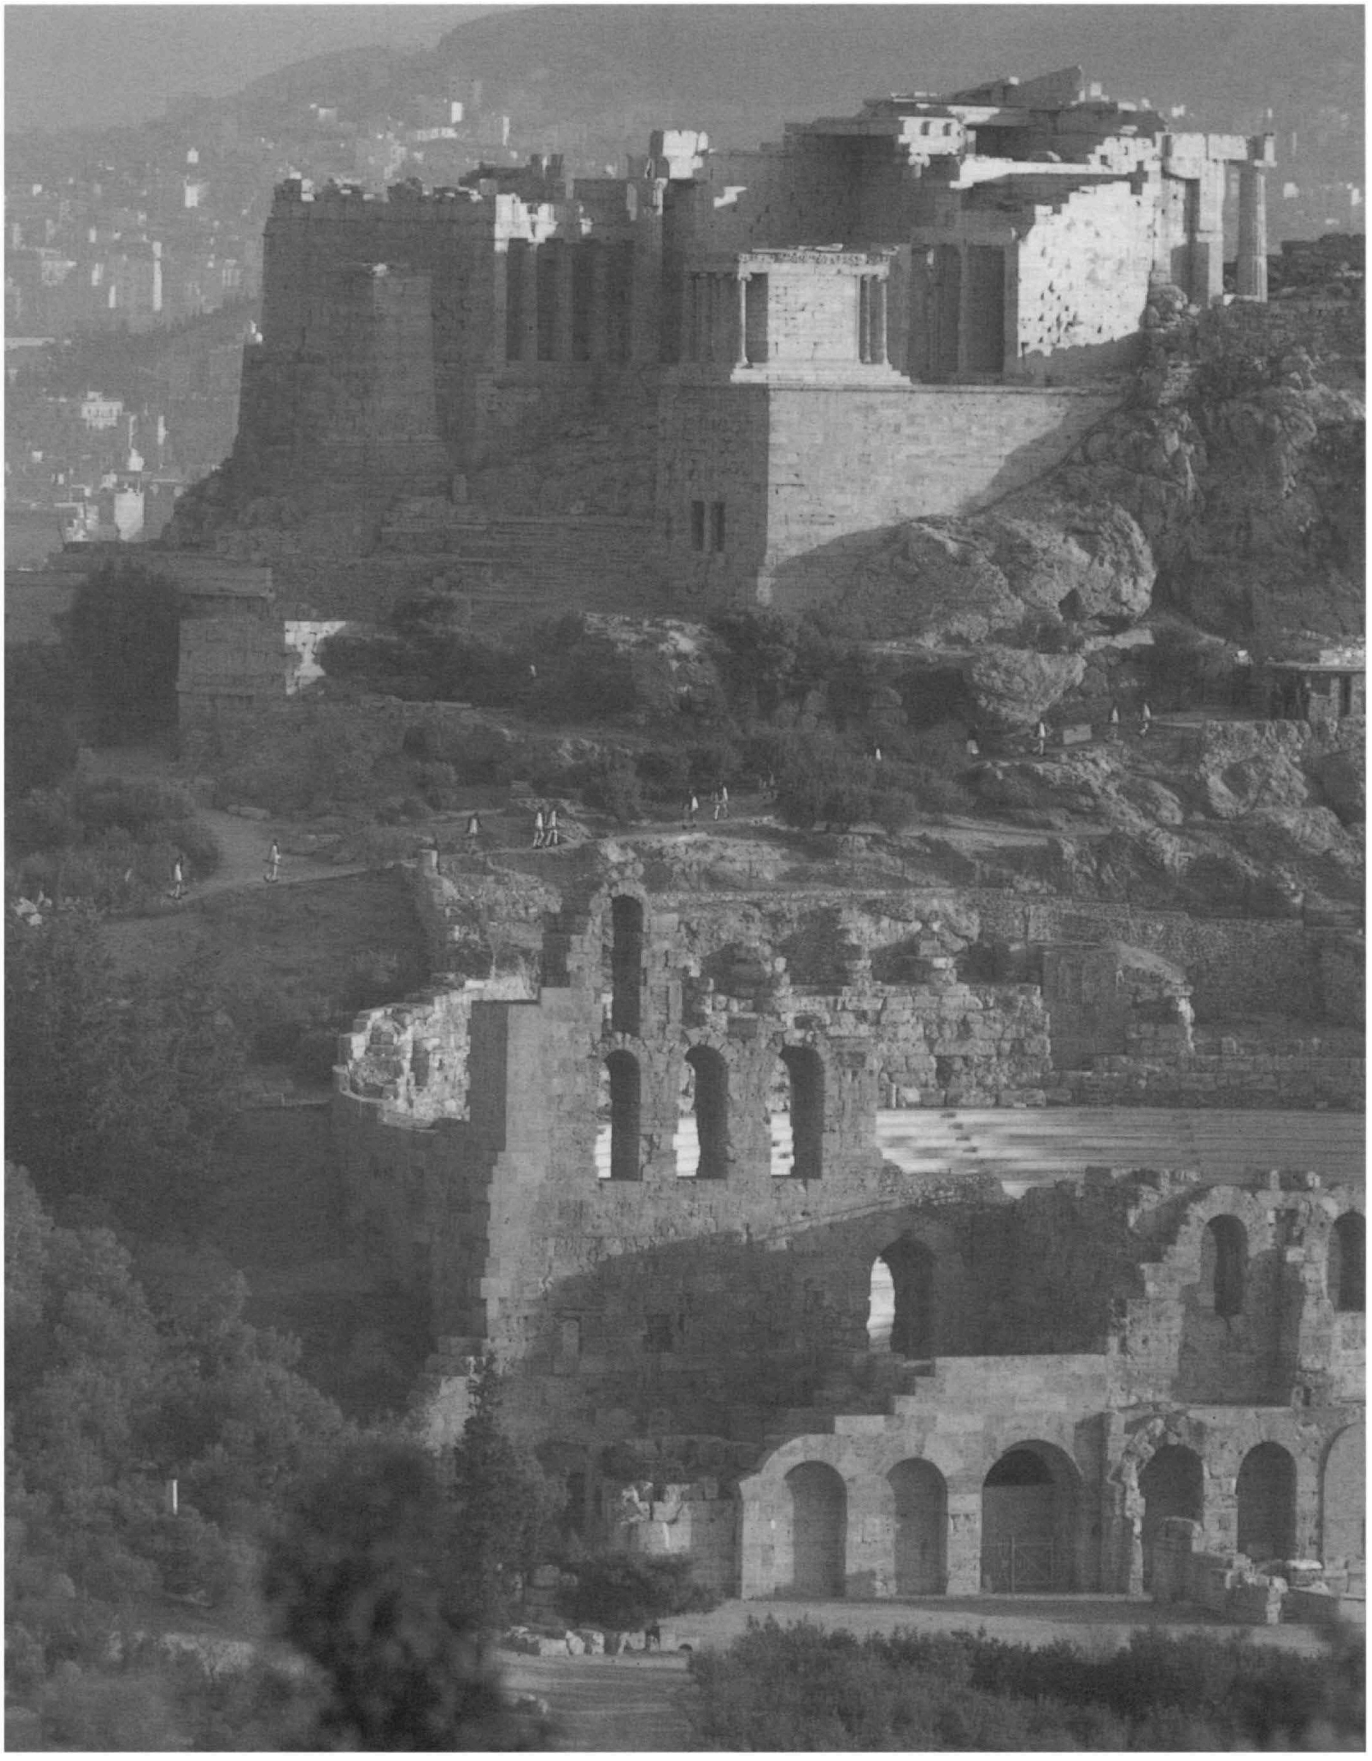
Acropolis of Athens

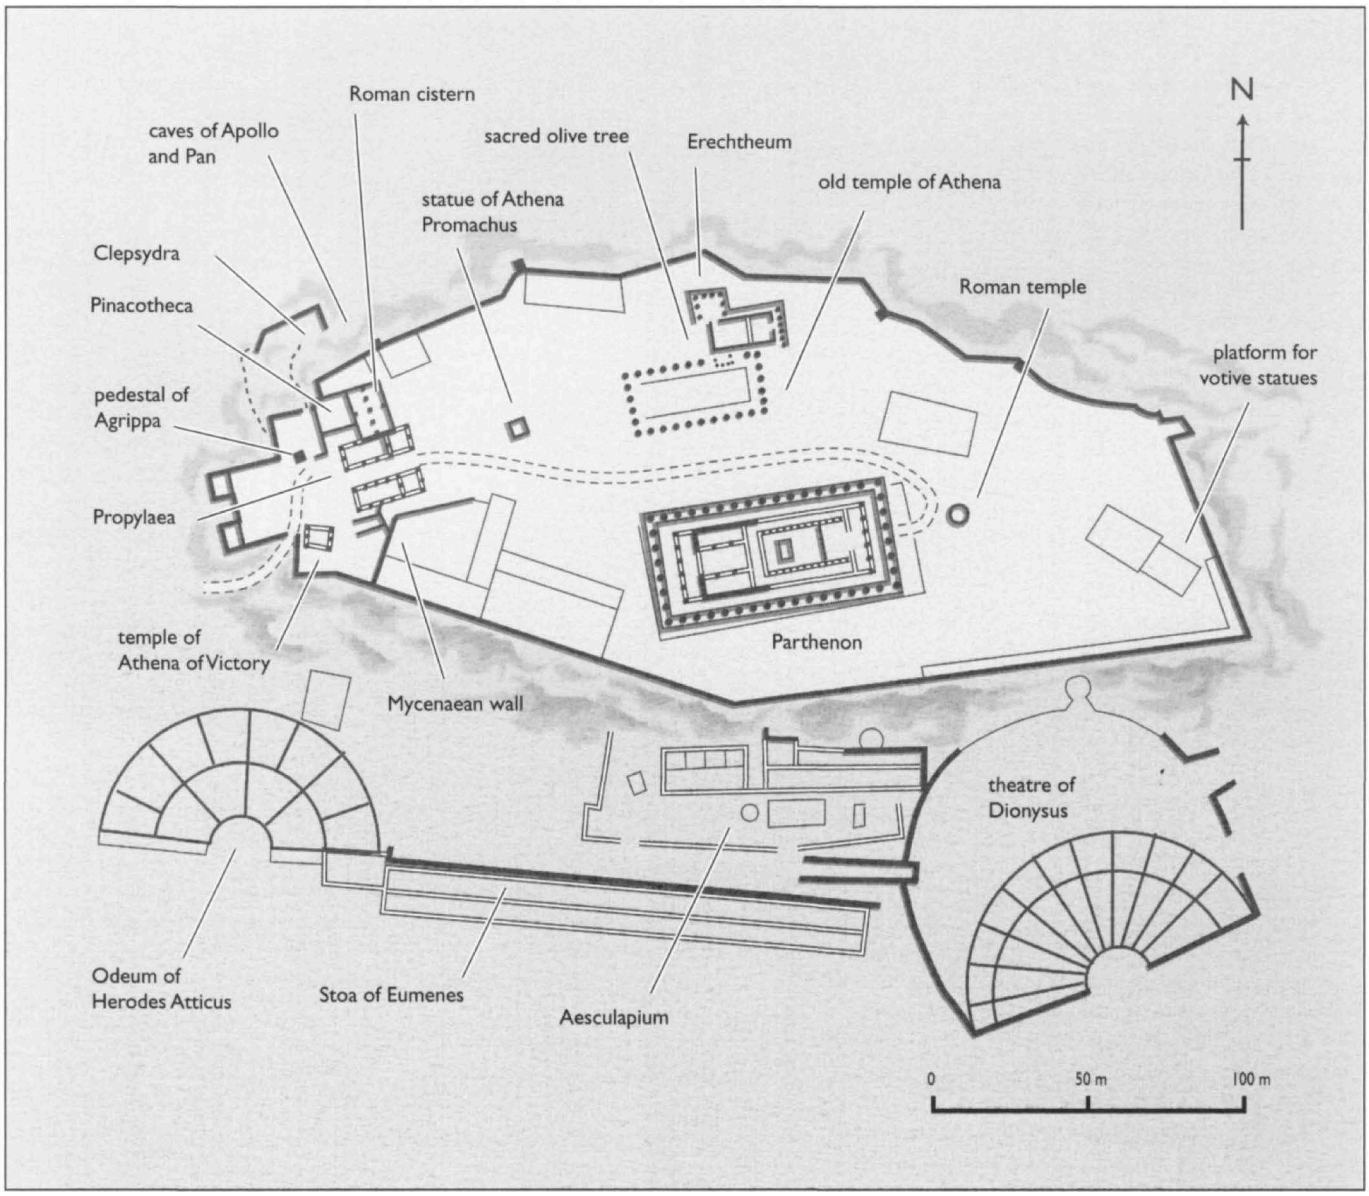
The Acropolis is the heart of the ancient city of Athens. It was the focus of habitation from the earliest days of known settlement; its limestone rock, relatively sheer-sided, provided a place of refuge, and it has abundant springs of water round its lower slopes, particularly on the north side. In course of time it became the Late Bronze Age citadel, strengthened with massive fortification walls similar to those at Mycenae and Tiryns, with a palace-type structure within. Sections of the wall survive and are still visible: there is an important stretch at the west end of the rock, while more is concealed behind later walls. The principal entrance was at the west end. It was obliterated at the end of the 6th century BC, and there has been much discussion of the form it took, but it must have had an outer courtyard, edged to the south by a projecting bastion based on the natural rock, and a dog-leg passage through a gateway at the northeast. Of the palace no real traces survive, but it was presumably situated towards the summit of the rock, at its approximate centre. A curiosity is a well, sunk down the side of the rock on the north, within the line of the walls, which gave access to a good water supply even when the Acropolis was under siege. The eventual fate of the citadel at the end of the Late Bronze Age is uncertain. Obviously, it was prepared for attack: the Athenian tradition (which deserves respect) is that the attack on the city was repulsed, and that its history was unbroken.

Certainly the citadel continued to be the focus through the early years of the first millennium BC. Whether it continued as a place of residence for kings is uncertain, but changing circumstances meant that it became rather the chief place of a cult, dedicated to Athena, the protectress of the city (Polias). Her altar was at the summit of the rock, and probably by the end of the 8th century BC a simple temple was situated near to it. The fortification walls remained, and the rock was still defensible, the entrance being as yet unchanged from its Mycenaean form. A curious survival is found at the well. This had partly collapsed and was filled in after only a short period of use, but the opening and the first few steps down remained, and were used for an annual ritual in which young girls chosen as priestesses descended as far as they could with mysterious bundles that they deposited at the bottom, perhaps an unconscious reenactment of collecting water when the well had functioned.

Development of the site was centred on the provision of improved structures for the cult of Athena. The temple in front of the altar (generally referred to as the "Old Temple") was steadily improved. A substantial foundation wall for its north side was constructed in the 7th century BC, and is still visible. Eventually, perhaps at the end of the 7th or in the 6th century



Acropolis of Athens: from the southwest with the odeum of Herodes Atticus in the foreground



1. **The Acropolis, Athens**

BC (the date is disputed), the temple became peripteral. It had a complex cella, double ended, the main room facing east to the altar, the west divided into two chambers side by side and with an antechamber. The whole building was surrounded by an outer Doric colonnade, behind which at each end inner rows of four columns stood in front of the porches (prostyle porches). The temple was decorated with sculpture, great pediment groups of heraldic felines, which were removed during later repairs and buried on the Acropolis, where they were found in the 19th century. They are now in the Acropolis Museum. The final rebuilding came towards the end of the 6th century BC, at the end of the period in which Pisistratus, and afterwards his son Hippias, ruled Athens as autocrats (tyrants in the Greek sense), and supposedly had a palace on the Acropolis. In its final form the temple was given a new external limestone colonnade, with metope panels of Parian marble, and new Parian marble pediment groups in the latest style, a battle of gods and giants, which included a striding Athena killing a giant, much of which survives in the museum. This temple contained the venerable and original cult statue, which was a simple image carved from olive wood. For it, the maiden priestesses of Athena wove, once every four years, a new dress or *peplos*, which was brought to the statue in a sacred procession. By the 6th century BC this procession of the Panathenaic Festival, held once a year, with a particularly important one for the bringing of the *peplos* every fourth year, was the main event in Athens' religious calendar, and resulted in a gathering of the majority of the citizens.

Less clear are the other structures on the Acropolis at this time. There is evidence for another large temple to the south of the Old Temple, which by the end of the 6th century BC seems also to have had marble metopes; and fragments of the superstructure of several small buildings, often highly decorated, for which no foundations survive. What is certain, though, is that the religious usages, the shrines, and the sacred spots on the Acropolis rock established during the early centuries of the

first millennium BC formed the basis of its continuing function throughout the Classical period.

Improvements began to be made at the end of the 6th and early in the 5th century BC. The Acropolis was last defended, in a minor skirmish, by the Spartan king Cleomenes I in an abortive intervention following the downfall of the tyrants; but it was then essentially demilitarized, the city being defended, presumably, by an outer circuit of walls. The old Mycenaean gateway was therefore torn down, though the forecourt, presumably an important point in the passage of the procession on to the rock, was retained. A new marble gateway with a colonnaded façade was eventually constructed. More importantly, after the victory of Marathon in 490 BC, the southern temple was pulled down and work started on a new, large, and magnificent Doric temple, in marble quarried on Mount Pentelicus, for which the first requirement was deep foundations, 20 courses of limestone, along its south side so that it could be extended in that direction. This work must have caused severe damage to the Mycenaean walls, which were here in a state of collapse.

The work stopped abruptly in the late 480s BC, when the threat of a new Persian invasion probably meant that all available funds were diverted to the building of warships. Athens was abandoned to the invader. The wooden cult statue, together with the women and children, was evacuated, and the walls of the Acropolis hastily patched up and a forlorn defence mounted, not perhaps in opposition to the policy of evacuation and naval defence but because the Athenians felt an obligation to defend the goddess's property. The Acropolis fell and was sacked. The innumerable statues set up as offerings to Athena (many on behalf of the priestesses when their period of office ended) were vandalized, and the partly built new temple, in its scaffolding, and hardly risen above platform level, was burned. The centre of resistance was probably at the gateway building, which would have been fiercely defended. This was severely damaged. The Old Temple was also burned.

When the Persians were driven out, the Athenians returned to tidy up the Acropolis, but not, as yet, to rebuild. The broken statues were gathered up, and, as the property of Athena, buried on the rock itself. The damaged outer colonnade of the Old Temple was dismantled, and part of its entablature built into new walls surrounding the Acropolis, near where the temple stood, on the north side, presumably as a war memorial. It is still visible there. The gateway building was repaired, using secondhand material. Some sort of simple shrine was built at the side of the Old Temple to house the wooden statue, returned from evacuation. The west cella of the Old Temple was patched, to serve perhaps as a repository for sacred objects rather than as a temple. And nothing else: either the resources of Athens were devoted rather to the prosecution of the continuing war against Persia, or the Athenians felt bound by an oath sworn by their army before the battle of Plataea, not to rebuild the vandalized buildings but to leave them in a ruined state as a memorial to the barbarians' sacrilege.

The revival finally got underway in 451 BC. Athens's prestige as a leader of the Greek world demanded splendid buildings on the Acropolis. Control of what was now in effect an empire provided funds, and the war against the Persians had reached some form of satisfactory conclusion. The rebuilding is essentially associated with Athens's greatest politician, Pericles, though he did not live to see it completed. Work began with the south temple, known as the Parthenon, the temple to Athena the virgin goddess (though her cult title was still Protectress of the City). Material left undamaged from the unfinished predecessor was used, including the massive south foundation, but the temple was slightly larger and certainly more magnificent, with eight rather than six columns forming its façade. It was built of Pentelic marble; the architects are named as Callicrates and Ictinus. The lavish sculptural decoration was designed by Phidias, though a whole gang of craftsmen would have been employed to execute the work. All the metopes are carved, and a tremendous continuous frieze ran across the inner porches and over the side walls of the cella. The pediments depicted the contest of Athena and Poseidon for the patronage of Athens, and the birth of Athena. The cult statue was a masterpiece in gold and ivory. The whole was completed in 436 BC.

The second building to be replaced was the gateway, the Propylaea, elaborated to include not only the gateway itself, with Doric porches, but also adjacent rooms, one, at least, to the northwest side being used for ritual feasting and decorated with paintings. Work started in 436 BC, to the design of Mnesicles, but, with war against Sparta looming, the plan was truncated, the inner rooms being abandoned. The structure was brought to a hurried completion just before the war broke out, in 431 BC. The abandoned rooms were never built, though indications of their position can still be seen.

Other building was resumed in the years of peace that began in 421 BC. A small temple of Victory (Nike) in the Ionic order was constructed on the bastion of the entrance. Shortly after, the replacement for the Old Temple was started on a new site to the north: the remains of the Old Temple were eventually removed, leaving only the foundations, which are still visible. The new building (popularly called the Erechtheum, after the legendary king Erechtheus, but more officially "The Temple in which is the Old Image") is built to a most unconventional plan. It has a rectangular cella, on two levels, higher at the east, lower at the west, with an internal arrangement recalling the Old Temple. The eastern room housed the cult statue, and had a façade of six Ionic columns. There is another Ionic porch at the west end of the north side, Ionic columns on the west end (but with bases at the higher, eastern floor level), and on the south, a small projecting porch whose roof and entablature rest on the heads of six incongruous draped female statues, recalling the earlier statues of the priestesses, which were now buried nearby. This building is more than a temple, rather a decorative embellishment to a number of sacred spots and shrines. It gives access, through a subsidiary door in the north porch, to the shrine of Pandrosos and the sacred olive tree, the gift of Athena herself when she contested the patronage with Poseidon. In the north porch is Poseidon's effort, a pool of salt water, which appeared when he struck the Acropolis with his trident. Building the Erechtheum dragged on. Completion was delayed by a fire, and it was finished only in 406 BC, just before the Athenians were finally defeated by the Spartans.

After that, Athens no longer had the money for lavish buildings. Statues and other offerings were dedicated in abundance over the years, one of the earliest and certainly the largest being the colossal bronze statue of Athena the Champion by

Phidias, which stood between the Propylaea and the temples. In the years after the death of Alexander the Great in 323 BC the successor king Demetrius Poliorcetes took up residence on the Acropolis as befitted a king (the stories of his orgies with prostitutes there may well be a calumny). In the 1st century BC the Erechtheum was again damaged by fire, but was carefully repaired, the new workmanship being of the same high standard as the original. The same craftsmen were employed, to judge from the details of the work, to build a small circular shrine dedicated to Rome and Augustus, placed in front of the Parthenon. After that little changed, though the Parthenon was severely damaged by fire in the 4th century AD and needed repair. The Acropolis had become a classic monument to Athens's days of glory; its fame, and the reputation of its buildings, was universal, even when other places were built more lavishly, and on a larger scale.

Change, naturally, came in the Middle Ages. The Parthenon retained a religious significance until the 1830s: it was converted, with the construction of an apse in its east porch, into a Christian church dedicated to the Holy Wisdom (which of course recalls its original dedication). Under the Franks in 1204 it became a Roman Catholic cathedral. With the Turkish conquest in 1456 it became a mosque, and the bell tower of the church that had been built into the western porch was converted into a minaret. In 1687 it was used by the Turks as a gunpowder magazine during the siege of Athens by the Venetians, in the expectation, a vain one, that it would be respected by the besiegers. The resulting explosion blew out the walls of the cella and took off the later roof that then covered it. Later a small mosque was built on the ruins. The Erechtheum became a residence for the Turkish governor and his harem; the Propylaea was adapted as a castle, with a massive tower built on its southwestern wing. Like the Parthenon it was damaged by the explosion of a gunpowder store. Above all, the Acropolis had reverted to its original function as a stronghold: it held a Turkish garrison. It was seized and held by the Greek insurgents against Turkish attack in the War of Independence in the 1820s.

After the freeing of Greece from Turkish rule the last Turkish garrison marched out through the later fortifications and gateway that had been built in front of the Propylaea. For Greece, the Acropolis was now a symbol of the renewal of the old Hellenic spirit and tradition, and the later accretions had to be removed. The Turkish houses and cisterns on it were quickly taken down. The gun position built by the Turks on the Nike bastion was demolished, revealing the dismembered marble of the original temple, well enough preserved for Ludwig Ross to reconstruct it. The "Frankish" tower on the Propylaea was removed at the expense of Heinrich Schliemann in 1874. All the Classical buildings were consolidated and, as far as possible, repaired. At present the Acropolis and its buildings are undergoing another crisis, caused by the vast number of tourists, the atmospheric pollution of the modern city, and the poor quality of some of the earlier repairs. A new and astronomically expensive programme of conservation demonstrates the continuing importance of the Acropolis to the Hellenic tradition.

R.A. TOMLINSON

Summary

Rocky outcrop that was always the focus of the ancient city of Athens. In the Bronze Age it became a citadel encompassing a palace. Later it became the centre of the cult of Athena and temples were built from the end of the 8th century BC. Sacked by the Persians in 480, the temples were rebuilt (451–436 BC) in grand style by Pericles. Later a church and then a mosque, the Parthenon and other buildings stand as a symbol of the survival of the Hellenic tradition.

Adoption

The major preoccupation of modern legislation on adoption is the welfare of the adopted child. In ancient Greek cities adoption was used mainly as a succession strategy for childless people. It also entailed duties of a religious character for the adopted person. Adoption has always had a public dimension, expressed either with a declaration in the marketplace or in a civic ceremony or, as in Hellenistic Egypt and Byzantium, with the written instrument or, as happens today, with a court decree.

The laws of Gortyn regulate in detail the process of adoption (called anpansis). Only male adults had the right to adopt. The adoption took place in public, in the agora. The declaration was followed by a ceremony in the political association (*hetaireia*) of the adopter and a sacrifice. The existence of natural children was not an impediment to adopting other children. Legal implications related mainly to inheritance. In particular, if the adopter died without natural heirs, then the adopted inherited his property as well as the obligation to perform religious rites. If the adopter had natural sons (or daughters), then the adopted received a portion equal to that of the natural heiresses. If the adopted died without natural children, the property he inherited was transferred to the next of kin (*epiballontes*) of the adopter. The adoption was cancelled in public and the adopter had to pay 10 staters to the judge, who in his turn gave this amount to the adopted.

In Athens adoption (*(eis)poiesis*) was geared towards the establishment of an heir to the adopter's property and the continuation of his *oikos* (family). Adoptions could be performed in one of three ways: during the lifetime of the adopter (*inter vivos*), by will (testamentary), and posthumously. Only men could adopt, and it was more likely that adult men rather than boys would be adopted. The adopted was able to inherit the property of the adopter like a natural son, without any previous legal formalities. Testamentary adoption was introduced by Solon at the beginning of the 6th century BC. It allowed a man without sons to adopt by testament an adult male, who would inherit from him. If there was

a natural daughter, the adopted son would either marry her himself or provide her with a dowry equal to half of the paternal property. Elderly people were safeguarded from being manipulated by a law annulling an adoption if the adopter was very old or suffered from a mental or physical illness or was under the influence of drugs or was threatened. Finally and most curiously, a posthumous adoption could be performed by the family in the context of a mutually acceptable settlement.

As for other Greek cities we know that in Sparta an adoption took place in front of the kings while in Thebes there was a connection between adoption and grants of land. Adoptions are attested in a large number of inscriptions, especially from Rhodes.

Adoption in the early Byzantine period presents similarities with adoption in Greco-Roman Egypt, where adoption ceased to be oral and took written form. Both parents of the adopted had to consent. In the 6th century Justinian I introduced two kinds of adoption: *adoptio plena* when somebody was adopted by a natural forbear, and *adoptio minus plena* for all other adoptions. In the latter case, the adopted retained the property and succession rights of his natural family.

In the 10th century Leo VI the Wise reformed the system of adoption by granting the right to adopt to women and eunuchs and by banning marriage between a natural and an adopted child. In practice, adoptions were concluded in writing. Adoption agreements did not in themselves constitute the adoption. However, these agreements expounded the rights and duties of the contracting parties; the adopters had to provide the material necessities and a dowry while the adopted was expected to serve and honour his adopted parents. The right to inherit was not automatically granted but had to be explicitly stated. Otherwise, the adopted had a claim to intestate inheritance.

Adoption was used in the imperial court by childless emperors to provide a successor to the throne or by ambitious pretenders anxious to get nearer to the centre stage.

In modern Greek law adoption is allowed if the adopters do not have children of their own. A court decision is required when there are exceptional circumstances. Adults can be adopted by a person older than 50, while a minor can be adopted by anyone older than 30. In any case there should be a difference of 18 years between the adopted and the adopter. The consent of the adopted is required; but if he is a minor, parental consent is needed. Adoption results in the adopted having the same rights and duties as a natural child; however the adopted person retains the rights and duties towards his natural family unless otherwise stated. The adoption is cancelled either by recognition of the adopted as the parent's own child or with marriage between the adopted and the adopter or by court decree.

Adrianople

City in Thrace

Adrianople (modern Edirne) is located on the middle Hebrus (Maritsa/Euros/Meric) river where it is joined by two other rivers, the Arda and the Tunca (Tundzha). These rivers and their valleys provide access through the Macedonian mountains to the west, the major access from Bulgaria to the northwest, and the route to the Black Sea to the north. Adrianople's strategic location at the western end of an extensive plain which had the city of Constantinople at the eastern end meant that it was used to help safeguard Constantinople from invasions from the north and made it a focal point of military activity.

The original settlement, Orestias, was refounded as Hadrianopolis *c.*AD 126 by the emperor Hadrian, who perhaps was following Trajan's failed attempt to increase urbanization in Thrace. Adrianople itself rarely receives mention as an administrative centre and its importance as a bishopric, known since the end of the 4th century, declined from 27th position in the 7th century to 40th in the 10th century. Instead, more than a dozen battles and sieges in and around the city lend it its significance.

On 3 July 324 Constantine the Great engaged and defeated the forces of the eastern emperor, Licinius, setting the stage for Constantine's ultimate victory and consolidation of the empire under his sole rule. On 9 August 378 the Goths defeated the eastern emperor, Valens, just to the northwest of the city (see below). The city's defences proved strong enough to resist several attacks, in 378 by the Goths, in 583 by the Avars, and later in the 9th and 10th centuries by the Bulgarians, when the city was used as a strong point against them. It was successfully defended in subsequent centuries many times but fell and changed hands frequently during conflicts between Constantinople and its opponents in the 13th and 14th centuries. The city eventually became the Ottomans' capital until their capture of Constantinople in 1453.

The most important of these conflicts was the complete defeat of the Roman forces at the hands of a Gothic-Hunnic force in 378. Earlier in the 360s, Valens had pursued and defeated Gothic bands, forcing them to accept disadvantageous terms and to recognize the Danube as the boundary between the two peoples. By the mid-370s, however, internal dissension and pressures exerted upon the Goths and other Germanic tribes by the Huns, who were sweeping westward across the steppes of Central Asia, began to cause considerable

difficulties. The Goths were being squeezed between two very powerful groups, the Huns and the Romans.

In 376, led by Fritigern and Alavivus, perhaps as many as 70,000 to 80,000 (ancient sources say 200,000) Tervingian Goths were given permission by Valens to cross the Danube and to enter Roman territory, upon the condition of surrendering weapons and young males as hostages. No doubt Valens thought he would have new recruits for his armies. The situation was desperate for the refugees, who had suffered supply problems even on the left bank of the river. Roman officials either did not realize how many Goths were crossing and were unable to deal with the flood of refugees, or they exploited the starving masses by exchanging dog meat for children, who were enslaved. During this chaos a second group of Goths (Greuthungians) sought permission to cross the Danube along with some Alanic and Hunnic refugees and their mounts. They were refused but crossed anyway during the confused circumstances caused by the ill treatment of the Tervingi, whom they joined.

In what may have been an attempt to resolve the explosive situation, the Roman commander of Thrace, Lupicinus, invited Fritigern and Alavivus to a dinner in Marianopolis (Shumla). Here he either tried to assassinate the leaders, or he seized them and killed their bodyguard after a riot began when other Goths were denied access to the city. After the escape of Fritigern, the Goths laid waste the Thracian countryside.

More Alans and Huns had joined Fritigern by 378 and he had come to some sort of agreement with the Franks and Alemanni on the Rhine, who kept the western emperor Gratian from aiding his uncle Valens, who had settled his Persian affairs and moved his court from Antioch to Constantinople. Valens' general Sebastianus quickly brought the Goths and their allies to a standstill about 14 km northwest of the city. The Goths, probably about 20,000 warriors in a large group of 90,000 to 100,000, remained behind their wagon laager (war wagons assembled into a defensive circle). Valens rejected the advice of his general to await the reinforcements from Gratian and moved his army to Adrianople.

Receiving intelligence reports of a Gothic force of only 10,000 infantry and no cavalry, Valens followed the advice of Sebastianus and his staff against the dissenting voice of his general Victor and decided to attack, despite Richomeres' arrival with the information that Gratian's army was only a few days away. On the morning of 9 August, having deposited his baggage train and treasury in the city, Valens moved to engage the enemy.

He marched his 20,000 to 35,000 men (ancient sources give 60,000), of which one third was light and heavy cavalry, through 14 km of dusty, fired terrain under a soon-to-be scorching sun. Proper supplies and, it seems, reconnaissance were abandoned since, when the Roman force suddenly came upon the Goths, they were deployed without having had rest or a meal.

Fritigern, expecting the arrival of his cavalry at any moment, opted for delay by sending ambassadors to Valens seeking a truce. The talks came to nothing and, as often happens, the battle began by accident when Roman guards fired upon the Gothic camp without orders. Within minutes the battle was joined and the Roman line, still forming, was under attack. At the same time the Gothic/Alan cavalry returned and struck the Roman cavalry on the right. The Roman horse held its ground until the Roman centre was separated from the left flank, which had moved partially round the circle of wagons. At this point Fritigern moved to isolate the Roman cavalry on the left, driving them from the field. The Goths now were able to flank the Roman centre, pushing it against the laager and the Roman cavalry on the right. Under the pressure of heavy archery fire, the Roman horse on the right broke and fled the field, leaving the infantry to deal with both Gothic cavalry and infantry. In an ever-decreasing amount of space that hindered their defence, the Romans were overwhelmed and slaughtered when the Gothic reserve charged forth from the laager.

The devastation suffered by the Romans was tremendous: 14,000 to 25,000 casualties, and much of the command structure of both the infantry and cavalry including Sebastianus and other top commanders, 35 military tribunes, and the emperor himself. If the higher estimates are believed, not since Cannae had the Romans suffered such losses of manpower and commanders. These losses, coupled with the presence of a very considerable and hostile Gothic force, created a desperate situation for the eastern empire.

The Goths tried to follow up their victory on the battlefield by assaulting Adrianople and Constantinople but failed. Much more serious were their unhindered attacks upon smaller settlements and the damage suffered throughout the rest of Thrace. The threat they represented had important consequences for the future of the empire: the appointment of Theodosius as emperor, his enrolment of barbarian recruits into the army, and the settlement of Goths as federates within the empire with special privileges.

The battle of Adrianople has often been regarded as a turning point in history and in the history of western warfare. Yet in many ways this is not so. Simple mistakes and miscalculations gave the Goths the victory. Had Valens acted immediately upon his intelligence or waited for Gratian's forces the result would probably have been different. Nor did the role of the Gothic cavalry drastically alter warfare as has been argued. By far the most important results were Roman accommodation of their barbarian neighbours and the growth and use of barbarians in Roman military ventures.

ANDREW N. SHERWOOD

Summary

City in Thrace whose strategic location made it the site of numerous battles and sieges, most notably the battle of AD 378 in which the Roman army was routed by a combined force of Goths and Huns. A direct consequence of that battle was the greater use of barbarians in the Roman army. Briefly the Ottoman capital, Adrianople was renamed Edirne in modern Turkey.

Adultery

Hellenic culture has exhibited an almost obsessive concern with female chastity since the time of Homer; Helen's elopement with Paris led to the Trojan War, while Aegisthus' seduction of Clytemnestra destroyed her husband and endangered his house. One key to this concern is the legitimacy of children; a man can never be absolutely sure of his own paternity and that of his children, and even Telemachus, son of the superchaste Penelope, admits that it is a wise child who knows his own father (*Odyssey*, 1. 215–16). Equally important is the impact of female unchastity on social relationships between men. These relationships are informed by concepts of honour, shame, and public reputation, ideas crucial to an understanding of the sexual mores not only of Greek antiquity but also of modern Hellenic society.

With regard to adultery (*moicheia*) in ancient Greece, it was the married or marriageable status of the woman involved that was the crucial point, not the status of the man. *Moicheia* comprised sex between any man, for whom marital status was irrelevant and marital fidelity unnecessary, and a female under a male citizen's protection (that is, the wife, daughter, sister, or mother of a citizen); for a man, married or unmarried, sex with a slave or a prostitute, male or female, did not constitute adultery.

Concerns about adultery in antiquity were informed by particular political and inheritance systems. In Classical Athens, where the male line was a critical factor in the transmission of property and citizen status, the avoidance of adulterine bastardy was accorded a corresponding importance; where patrilineal inheritance pertains, all property depends upon the chastity of women.

Extreme penalties were attached to adultery in Athens. A Draconian law of 621 BC allowed the summary execution of an adulterer caught in flagrante, while Plutarch attributes to Solon a law that allowed a father to sell into slavery an unmarried daughter caught with her seducer (*Solon*, 23. 2), an unparalleled treatment of a free person in Attic law and an indication that the ruined girl no longer had any civic status to violate. These uncompromising penalties had fallen into disuse by the Classical period, but still adultery was criminalized as an act of hubris (disrespect, outrage) against both the individual (that is, the citizen in charge of the ruined woman) and the community. Adultery was regarded as an anti-democratic offence, an act of political as well as sexual subversion, and, accordingly, the social and legal consequences could be severe. Adultery could be used as a justification for homicide if the adulterer (*moichos*) was caught in the act, but the penalty attaching to the charge of adultery (*graphe moicheias*) was more usually a fine or public humiliation. However, there is no firm extant example of the use of the *graphe moicheias* and a prosecution for hubris (*graphe hubreos*) may have been preferred. There was no legal procedure available against the woman taken in adultery, but her punishment was severe also; she was compulsorily divorced and prohibited from participating in public sacrifice ([Demosthenes], 59. 87; Aeschines, 1. 183–84). However, the shame attaching to the cuckold and the compulsion to return both wife and dowry may have induced some husbands to keep the matter quiet and out of the public arena (Euripides, *Hippolytus*, 462–63; Aeschines, 1. 107), and there is evidence to suggest that others manipulated the situation to extort money from adulterers ([Demosthenes], 59. 64–70).

Despite the potential consequences, adultery provided an opportunity for erotic and romantic attachments in a society where arranged marriages were the norm. Many may have thought it a risk worth taking, and several texts imply such behaviour may not have been uncommon (for example, Aristotle claims that it is easy to commit adultery with the wife of a friend or neighbour: *Ethica Nichomachea*, 1137a5). Nevertheless, adultery was regarded as such a severe dereliction of social and civic duty that it could be described as a crime worse than rape (Lysias, 1. 32–33), perhaps because seduction involves the desire and complicity of the woman, and her deception may extend to passing off a lover's children as a husband's. Thus the adulterer and his offspring could take over the household and its legitimate line of descent.

For democratic Athens the civic consequences of adultery were incorporated in the political notion of hubris, but the personal and social dishonour that attaches to the man who cannot guard the women of his household or avenge their disgrace is a transhistorical concept for Hellenic culture which has persisted into 20th-century Greek society. A man's honour (*time*, a term used in both ancient and modern Greek), that is to say, the social recognition of his worth, is defined largely through the chastity of his women. If the chastity of a man's mother is compromised, his own legitimacy is at stake; if his wife is suspected of adultery, the implication is that his children may be bastards, while the idea that a man is not man enough to control his women is a slur on his masculinity (*andrismos*, a modern Greek term). Conversely, the adulterer, while condemned as socially disruptive and a threat to family stability, may enhance his reputation for virility through his behav-

iour. The cuckold, however, is a shamed, emasculated, and stigmatized figure. Women are expected to safeguard their own and their families' reputations by cultivating the appearance of sexual modesty (*dropi*, again a modern Greek term). In the 5th century BC Pericles proclaimed that a woman's greatest glory was not to be talked about (Thucydides, 2. 45), and the public demonstration of female chastity is crucial still – women must not only be chaste, they must be seen to be chaste. Social reputation and gossip are particularly significant in face-to-face societies, not only in those of the ancient world such as Athens but in any close-knit Hellenic community in or outside Greece, and perhaps especially important in village life.

These common social attitudes towards adultery are supported by the Church's attempts to regulate sexual behaviour. Adultery has been marked out for especial censure throughout the Christian tradition, which condemns fornication, a notion that embraces any extramarital sex, either premarital or adulterous, and which threatens the Christian ideal of the "pure" marriage. Indeed, later canon law prescribed death for the adulterer, the strong proscription being based on Matthew 5: 32, which proclaimed that "whoever looks at a woman to lust after her commits adultery with her already in his heart", a pertinent illustration of the Christian principle that sexual fidelity is expected of husbands as well as wives, a marked contrast to the ancient world. However, it is the adultery of wives, not husbands, that provides the only valid grounds for divorce in the Orthodox Church, at least technically, referring to the authority of Matthew 19: 9, which states that if a man remarries, having divorced his wife for any cause other than adultery, he himself commits adultery. For Christian Greeks in particular the marital status of men as well as women is relevant to the definition of adultery, but from antiquity to the present, in both social and religious terms, the unchastity of wives has been the greater concern.

Aegae

City in Macedonia

The Macedonian city of Aegae (more properly Aegeae) is situated in the northern foothills of the mountain range of Olympus, by the modern village of Vergina, overlooking the river Haliacmon and what is now a rich extent of flat cultivated plain but in antiquity was more likely, at best, marshland. The ancient road to northern Greece, followed by an Athenian army in 432 BC, ran from the coastal towns of Pydna and Methone westwards past Aegae before turning north at the next locality, Beroea. This area formed the Macedonian heartland, and from it successive Macedonian kings extended their rule west and north, until by the 5th century BC the whole region round and beyond the Axios (which flows down from the central Balkans) was part of the Macedonian state.

The city itself is still largely unexcavated. Traces of its fortifications and a city gate, enclosing an acropolis-type hill, can be made out, but archaeological work has concentrated on the areas below this, where important discoveries have been made. The existence of important remains was first noticed by the French archaeologists L. Heuzey and H. Daumet in the 1860s, though they did not identify the site as the ancient Aegae. Following an ambiguous passage in the Roman historian Justinus (7. 1. 7) it was believed that Aegae was situated at Edessa, where there were also ancient remains; but in an important paper given at the First International Symposion on Ancient Macedonia in 1967 N.G.L. Hammond pointed out that this was a misinterpretation, and that Aegae was located

elsewhere: because of its archaeological remains, and other literary evidence, particularly Theophrastus, *De Ventis*, 27, he suggested Vergina. Subsequent discoveries there have more than confirmed this.

Outside the town, on the flat ground, is an extensive cemetery of pit graves covered with low tumuli dating from the early Iron Age (the turn of the 2nd and 1st millennia BC) into the Classical period. The contents of the earlier tombs show connections with regions further to the north, and they are therefore to be identified as the graves of the original Macedonian settlers. There is no good archaeological evidence for the adjacent settlement at this time, and it hardly merits being called a city. Its importance is demonstrated rather by the large number of graves. Aegae is thus the traditional Macedonian centre, and remained so, particularly in terms of its religious function, even when a new city was created at Pella. It should have been a place of residence for the Macedonian kings, but although the 5th-century king Perdiccas was encountered there by the Athenian army in 432 BC, there is no trace of an actual royal residence until the end of the 4th century BC when a substantial palace was built, measuring overall 104.5 by 88.5 m. This consists of a central courtyard 44.5 m square with a peristyle of 16 Doric columns on each side. To the east and north are open verandahs (a most unusual feature for Greek residences, which are invariably closed and inward looking) commanding extensive views over the Haliacmon. Most of its rooms are equipped as formal dining rooms, appropriately graded to accommodate the different ranks of the Macedonian court; the palace seems to have been designed primarily for ceremonial or religious functions rather than as a conventional administrative building.

Below the palace is the theatre, which had wooden seats arranged on the earth slopes, apart from the first row which was limestone. It was here that the great Philip II was murdered in 336 BC, watching a procession in celebration of the marriage of his daughter Cleopatra. Nearby is a small temple, dedicated to the goddess Eucleia by Philip's mother Eurydice. But the most convincing evidence that Vergina is the ancient Aegae is the Great Tumulus, excavated by Manolis Andronikos. Aegae was known from literature (Plutarch, *Pyrrhus*, 26. 6–7) to have been the burial place of the Macedonian kings. Hammond suggested that a built vaulted tomb, of the type categorized as Macedonian and excavated by K. Rhomaios in the 1930s, decorated in the same form of the Ionic order as the monument of Philip at Olympia, might be where he was buried after his assassination. Andronikos's excavation of the largest of the tumuli uncovered more "Macedonian" tombs, including one that was unrobbed, containing the remains of the cremated dead (a man and a woman) in chests of gold together with a vast array of other objects, gold, silver, ivory, and an iron breastplate similar to that worn by Philip's son Alexander in the mosaic which depicts him at the battle of Issus. The remains of the dead man were not completely reduced to ashes, and enough of the bone structure remained to indicate that he was of Philip's age when he died, and that, like Philip, he had been blinded in one eye by an arrow which had entered the skull from above; in all there is ample evidence to confirm the identity of the great Macedonian king and the locality at Vergina as the city of Aegae.

The subsequent history of Aegae is uncertain, and there is no secure archaeological evidence later than the Hellenistic palace. During the troubled years which followed the death in 297 BC of king Cassander (who may have been responsible for the palace) the royal tombs were plundered by Gallic mercenary soldiers employed by the king of Epirus, Pyrrhus, during his invasion of Macedonia in 288 BC. Somehow, Philip's tomb escaped, and it was after this that Antigonus Gonatas, when he secured the kingship of Macedon for himself in 277/76 BC, heaped over it and another unplundered royal tomb the great mound which preserved it intact.

After the final Roman conquest of Macedon following the battle of Pydna in 167 BC, Aegae disappears from history. It is not one of the capitals of the four separate regions into which the Romans divided the former kingdom. Too closely associated with the traditions of the Macedonian people and monarchy, it had no place in the Roman system of things. If not deliberately destroyed, it was defortified and, probably, allowed to dwindle away, its place as the leading city of this area being taken over by Beroea.

R.A. TOMLINSON

Summary

Ancient city in Macedonia near the modern village of Vergina. It was the religious centre of Macedonia and the burial place of its kings. Following a suggestion made by N.G.L. Hammond in 1967, Manolis Andronikos excavated an unrobbed tomb containing spectacular grave goods which can be safely identified as that of Philip II.

Aegina

Island in the Saronic gulf

The island of Aegina lies centrally in the Saronic gulf, some 20 km southwest of Piraeus and the same distance from the Argolid peninsula; it has an area of 83 sq km. The location of the island so close to Attica resulted in a greater involvement with the events and developments of mainland Greece throughout its history than any other island of the Aegean. It has always benefited from a fine natural harbour on the west coast, beside which the town of Aegina grew up and flourished. Its climate is more sheltered than most of the Aegean islands, and its land produces major crops of pistachio nuts as well as olive oil, grapes, almonds, and figs.

Colonized in the 3rd millennium BC, by the 2nd millennium BC Aegina had already become an important trading post. During the 10th century BC (according to Herodotus) the island was colonized by Dorians from Epidaurus, having previously undergone Mycenaean occupation; since then it has

Aegina: the temple of Aphaea, built in the late 6th or early 5th century BC

played at various points an active, and sometimes vital, part in Greek history. The Aeginetan navy was a force of paramount importance from the 7th to the 5th centuries BC, and played a major role in the defeat of the Persians at Salamis (480 BC). Also flourishing during these centuries were the skills of its potters and bronze-founders, and modern products of the former are still sold widely today. But the outstanding survival from this period is the temple dedicated to Aphaea, built in the late 6th or early 5th century BC on a hill in the northeast of the island and looking out over the Saronic gulf towards Attica. Although considerably damaged, it still retains 24 of its 32 original columns, and of particular interest are surviving traces of pigmentation on the floors of the pronaos and cella; originally the columns, of local limestone, were stuccoed and then coloured. Figures from the pediments, carved in Parian marble by the famous Aeginetan sculptor Onatas, were taken to Munich after their discovery in 1811. The individuality of Onatas' artistic style is suggested by the comment of Pausanias (5. 25) that his figures, "even though they are in the Aeginetan style, I would not assess as inferior to those of the Attic school of sculptors". Another sculptor from Aegina called Smilis, the son of Euclides must have been one of the more famous sculptors of his day, since the cult image of Hera in the huge temple on Samos was, according to Pausanias, made by him (7. 4). Later, the inhabitants of Aegina were expelled at the start of the Peloponnesian War, but were able to return by 400 BC. For the rest of the pre-Christian period the history of the island was closely linked to that of Athens.

Several early Christian basilicas have been excavated within the area of the town of Aegina, indicating a continuing prosperity into the 6th century AD. To the north of the town the hill of Colonna was fortified by this time, and a unique survival is the 4th-century floor mosaic of a synagogue, of which the inscription gives its cost; the building was converted to a church after the 7th century. Around AD 580 the island became a place of refuge for the inhabitants of Corinth, fleeing the Slavic invasions of the Peloponnese, and during the 9th century, like many other of the islands and coastal sites, Aegina suffered from Arab raids.

In the Deed of Partition of 1204, after the Fourth Crusade, Aegina was one of the two Aegean islands awarded unambiguously to Venice, but its position meant that in reality it was ruled first by the dukes of Athens, and then, from the early 14th century, by the Catalan dynasty of the Fadrique (they styled themselves "Lords of Aegina" and sometimes "of Aegina and Salamis"). On the death of Antonello de Caupena in 1451 without heirs, the island was bequeathed to Venice, who appointed a governor responsible to their administration in Nauplia. The Venetians were to hold Aegina until its devastation by Khaireddin Barbarossa, the much-feared admiral of

Suleiman the Magnificent, in 1537. His massacre of the male population and the abduction of all the women and children left the island largely depopulated for the first time since the 10th century BC, and the later revival of its economy must have been due in part to Albanians who were subsequently introduced by Barbarossa.

It was probably during the Arab attacks that the first settlement was made on the hill towards the northwest of the island now called Palaiochora. With the growing insecurity and increase in danger from piracy that marked the 11th and 12th centuries, inland sites such as this grew in importance, and Palaiochora was to develop into a major ecclesiastical and administrative centre. During the period of Catalan and Venetian domination of the island it was the de facto capital and the seat of the Orthodox metropolitan; there are still 35 churches to be seen on this hilltop site, most built in the 14th–16th centuries; inscriptions survive here recording the restoration of individual buildings in 1533, 1610, 1619, and 1674, and so carried out during the Tourkokratia. This remains the largest and best-preserved source for knowledge of church building in this part of the Aegean during these centuries. Further rebuilding must have followed an attack in 1654 by the Venetian admiral Morosini, who succeeded in reoccupying the island for the Republic for more than half a century. At the Treaty of Karlovitz of 1699 Venice was specifically permitted to retain Aegina, and the island was ceded to the sultan only in 1718 at the Conference of Passarovitz.

The vigour of the Aeginetan economy is indicated by the population figures, which by the 1820s were said to be around 8,500; visitors to Palaiochora reported its population to be between 3,000 and 4,000 in the town alone, which had some 400 houses. It must have been this relative prosperity that, combined with its favourable location, caused the island to play a final brief but significant part on the stage of Greek political life. In 1826 Aegina became the seat of the Greek National Assembly during the period of instability that followed the War of Independence, and in 1829 the first coins of the modern Greek state were minted on Aegina under Ioannis Kapodistria. The monetary unit was named appropriately as the silver *phoenix*, with subdivisions of 100 *lepta*, and was renamed as the *drachma* only in 1833.

More recently Aegina has become the resting place of the embalmed body of St Nektarios (1846–1920) who as metropolitan of Pentapolis founded the Convent of the Holy Trinity there in 1904; in 1961 he became the first saint to be canonized by the Greek Orthodox Church in modern times.

Over many centuries and in a variety of ways Aegina can be seen to have contributed more to the Hellenic tradition than almost any other Aegean island.

Summary

Located in the Saronic gulf some 20 km southwest of Piraeus, Aegina has been closely involved in the history of mainland Greece. It had a famous navy in the 7th–5th centuries BC which fought at Salamis. It was ceded to Venice in 1204 and taken for the Ottomans by Barbarossa in 1537. In 1826 it was the seat of the Greek National Assembly.

Aeolians

Ancient ethnic group

Of all the major ethnic groups of ancient Greece the Aeolians are the most indistinct. In modern scholarship the term is generally applied to the populations of Thessaly, Boeotia, the eastern Aegean islands of Lesbos and Tenedos, and the northwestern littoral of Asia Minor north of the Hermus valley – largely on the basis of the structural similarities between the dialects of these areas (although the Boeotian dialect displays several "Northwest Greek" characteristics while the Aeolic dialects of the eastern Aegean are marked by "Ionicizing" features almost certainly due to regular contact with neighbouring Ionian settlements).

In antiquity, however, the term "Aeolians" was applied more indiscriminately. The 1st-century BC geographer Strabo (8. 1. 2) says not only that all the populations north of the Corinthian isthmus (with the exception of the Athenians, Megarians, and Dorians "around Parnassus") were Aeolian, but that the Dorians of northern Greece were themselves originally Aeolians whose speech and customs eventually became distinct as a result of their isolation from their neighbours. He claims further that Aeolians had inhabited the Peloponnese prior to the arrival of the Dorians but that most had assimilated with the Dorian invaders save for the Achaeans, the Eleans, and the Arcadians. It should nevertheless be noted that the West Greek dialects of Achaea and Elis and the Arcado-Cypriot dialect of Arcadia appear to demonstrate little or no similarity with the Aeolic dialect group. The lack of coincidence between claims of ethnic origin and the linguistic situation marks a striking contrast with the case of the Ionians and Dorians, and it has been suggested that the etymology of the term "Aeolians" indicates a group of mixed origins.

According to tradition, Thessaly had originally been called Aeolis (Herodotus, 7. 176. 4), though the 5th-century BC historian Thucydides (3. 102. 5) believed that ancient Aeolis was the area surrounding the Aetolian towns of Calydon and Pleuron. Sixty years after the Trojan War, the Aeolian Boeoti who had formerly been settling Thessaly were expelled and occupied Boeotia to the south (Thucydides, 1. 12. 3; Pausanias, 10. 8. 4). Immediately after settling Boeotia, some of the Boeoti accompanied Penthilus, son of Orestes, in his expedition to colonize the island of Lesbos and Aeolis in Asia Minor (Thucydides, 7. 57. 5; Strabo, 9. 2. 5). There were, however, variant versions – the 2nd-century AD traveller Pausanias (3. 2. 1) says that Penthilus colonized Lesbos and his grandson Gras

settled Aeolis, but Strabo (13. 1. 3) reports that it was Gras who settled Lesbos, while the city of Cyme on the coast of Asia Minor was founded by two other descendants of Agamemnon, Kleues and Malaus – and it is generally believed that the tradition of the Aeolian migration was a relatively late compilation that is unlikely to predate the 5th century BC. In particular, the idea that the Aeolian Boeotians were led by the ethnically unrelated Penthilus parallels the tradition of the Dorians returning to the Peloponnese under the leadership of the descendants of Heracles and was almost certainly coined to justify the claims of the Penthilidai, the ruling family in the Lesbian city of Mytilene (Aristotle, *Politics*, 5. 10).

In fact, it is more than likely that a sense of Aeolian identity first emerged among the cities that were founded in the eastern Aegean *c.*1000 BC. At the beginning of the 7th century BC Hesiod (*Works and Days*, 636) described how his father had left "Aeolian Cyme" for Boeotia; a century later the poetess Sappho evokes "the Muse in Aeolian Eresus" (a city on Lesbos), while a tribe named "Aeolis" is attested in the Lesbian city of Methymna. It is telling that the only Aeolian city which participated in the foundation of the 6th-century Hellenion sanctuary at Naucratis was the Lesbian city of Mytilene (Herodotus, 2. 178. 2). The principal vehicle for the expression of this identity was without doubt the league of 12 cities in Asia Minor which is described in the 5th century BC by Herodotus (1. 149) and which was originally thought to include Smyrna, Cyme, Larissa, Neon Teichos, Temnos, Cilla, Notion, Aegiroessa, Pitane, Aegaeae, Myrina, and Gryneia. Herodotus goes on to report how Smyrna was captured by the Colophonians and transferred to the Ionian Dodecapolis. It has been suggested that the league should predate the 8th century BC since from this time the archaeological evidence at Old Smyrna appears to display no qualitative differences from other Ionian settlements. On the other hand, there is no evidence that ethnic affiliations in ancient Greece were necessarily expressed through distinctive repertoires of material culture, and it is far more likely that the league emerged in the course of the archaic period (possibly the early 6th century) as a direct response to the foundation of the Ionian Dodecapolis. On the basis of perceived ties with central Greece (perhaps historical as well as invented), a sense of Aeolian affiliation may have spread from the eastern Aegean to the regions of Boeotia and Thessaly.

Towards the end of the 6th century BC the compiler of the pseudo-Hesiodic *Catalogue of Women* attempted to systematize and harmonize the variant genealogical traditions of different Greek cities so as to anchor local mythologies within a broader panhellenic context. Besides accounting for relationships between various local heroes, the *Catalogue* articulated in genealogical form the relationship between various Greek ethnic groups by deriving filiation of their eponymous ancestors (Aeolus, Dorus, Ion, Achaeus) from the original ancestor of the Greeks, Hellen (Hesiod, fr. 9, 10a). But whereas Dorus, Ion, and Achaeus are relatively faceless figures whose only function would appear to be to express relationships between Greek population groups, Aeolus stands at the head of a developed genealogical tradition that includes a host of heroes from various localities throughout Greece. It is highly likely that the Aeolus who acts as the ethnic eponym for the Aeolians has here been assimilated with an older homonymous figure and that Strabo's extensive application of the term "Aeolians" stems from the widespread distribution of local heroes belonging to this Aeolid lineage.

From the end of the 5th century BC Aeolian identity ceases to operate in any meaningful way. It is possible that it was its indiscriminate application that militated against any solid criteria for collective consciousness, but the political situation on both sides of the Aegean sea also played a role. In the east the Aeolian cities – like their Ionian neighbours – succumbed to the successive domination of Lydia, Persia, the Athenian empire, Persia again, the Seleucids, the Attalids, and finally Rome, though even prior to their incorporation within the Lydian empire they had, with the exception of the cities on Lesbos and Tenedos, accepted the leadership of the Ionians (Herodotus, 1. 151. 3). On the Greek mainland, Thessaly became increasingly riven by internal disputes while the Boeotian city of Thebes concentrated on promoting a pan-Boeotian federation over which it claimed hegemony; but any sentiment of ethnic affinity between the two regions was counteracted by their siding with opposing alliances during the Peloponnesian War and by the construction of an ethnicizing rhetoric between Dorians and Ionians in which the Aeolians found no voice.

Summary

Shadowy ethnic group of ancient Greece now identified on linguistic grounds with the populations of Thessaly, Boeotia, Lesbos, Tenedos, and the northwest coast of Asia Minor. All trace of their separate identity disappears at the end of the 5th century BC.

Aeschines *c.*390–*c.*322 BC

Orator

Aeschines came from an Athenian family that was impoverished by the Peloponnesian War. He was forced to earn a living, and his various early occupations included working as the secretary to the assembly and as a tragic actor. These, and military service for which he was decorated, would stand him in good stead in his political career, which took off after the

destruction of Olynthus by Philip II of Macedon in 348 BC. Aeschines was sent to Arcadia as an ambassador to promote Eubulus' proposed Greek congress, which would discuss resistance to Philip, but in the event in 346 BC he was one of the negotiators of the short-lived Peace of Philocrates. One of his fellow ambassadors was the staunchly anti-Macedonian Demosthenes, and the two men, who had fallen out when serving on the council in 347/46 BC, became sworn enemies. Aeschines may have been duped by Philip, who appeared friendly towards Athens, but Demosthenes accused him of accepting bribes. Demosthenes soon received more ammunition for this charge, as Philip invaded Phocis; Aeschines was sent to plead for fair treatment of the defeated Phocians, and Philip held a feast attended by Aeschines and his fellow envoys. On Aeschines' return to Athens Demosthenes began proceedings against him for treason (346/45 BC), but acted through the notorious rake Timarchus. Aeschines successfully countered with his *Against Timarchus*, in which he prosecuted Timarchus for addressing the assembly when forbidden to do so because of his immorality, and it was not until 343 BC that the mood in Athens was right for Demosthenes to bring the case himself. Aeschines delivered his *On the False Embassy* speech and was narrowly acquitted, but his credibility was undermined. Nevertheless, in 339 BC he was sent as an Athenian representative to the Amphictionic Council at Delphi; but at a time when Greek unity against the threat of Philip was essential, Aeschines managed to stir up a Sacred War against Amphissa. As a result Philip had the excuse he needed to intervene in central Greece, and Athens and Thebes were compelled to oppose him at the disastrous battle of Chaeronea. With his background of friendly relations with Philip and hostility towards Demosthenes, Aeschines was sent on the embassy to negotiate peace terms, after which he largely withdrew from the political arena.

Two opportunities subsequently presented themselves for Aeschines to return to the limelight and attack Demosthenes. In 336 BC Ctesiphon proposed that Demosthenes should be crowned for his services to Athens in the theatre at the Great Dionysia, and this gave Aeschines the chance to prosecute Ctesiphon for making an illegal proposal. Philip's murder, however, meant that the trial was delayed, and it was not until 330 BC, after the failure of Agis III's revolt and with Athens firmly under Macedonian control, that the second occasion presented itself. Aeschines delivered his *Against Ctesiphon*, in which he raised probably valid technical reasons for the illegality of Ctesiphon's proposal, but also attempted to show that Demosthenes' career made him unworthy of such an honour. Demosthenes replied with his superlative *On the Crown* speech, and Aeschines failed to secure one-fifth of the votes. He was thus fined heavily, but it was his humiliation that led him to retire to Rhodes, where he probably spent the rest of his life teaching rhetoric and giving public declamations.

Aeschines was not a professional speech writer, and there is no firm evidence that he studied rhetoric, even if he did become a teacher. His speeches are primarily important for their subject matter, but as with his political career, estimation of Aeschines' literary merits has suffered unduly in ancient and modern times by comparison with Demosthenes. Aeschines writes clear, vivid narrative, sometimes with lengthy sentences but regularly in shorter periods, and with an avoidance of hiatus that is evidence for careful composition. He employs ordinary Attic vocabulary, interspersed with poetic and rare words; and his actor's training leads him to frequent quotations of poetry, which are often long and largely irrelevant. He is prone to using exaggerated language (one of his favourite words is *deinos*, "terrible"), with accumulations of synonyms and appeals to the gods, and he has a range of vivid metaphors at his disposal. Aeschines has an innate wit, which is particularly noticeable when he is attacking Demosthenes, and these attacks can, in the fashion of the time, become extremely abusive. But generally Aeschines' Greek has a dignified tone, as befits a dignified man who deplored the use of extravagant gestures while speaking.

Only the three speeches mentioned above survive, and this was the case also in the Roman period, when Caecilius of Caleacte pronounced a fourth speech concerning Delos spurious. All three are forensic, though delivered in connection with wider public issues. Aeschines, however, tends to avoid these issues and to concentrate on the legalities of the case, but at the same time his talent lies in narrative rather than argument. Hence in *On the Embassy*, Aeschines' best speech, he does not attempt to explain his policies, but offers an amusing and lucid narrative of Demosthenes' totally losing his nerve in the presence of Philip on the first embassy sent to discuss the Peace of Philocrates. When it came to *Against Ctesiphon* Aeschines could not avoid discussing the wider issues, but he concentrates on the results of Demosthenes' policy, not the policy itself. Demosthenes' response was to emphasize the patriotism that underlay his opposition to Philip, and Aeschines later could not help but admire the speech that ruined him.

If Demosthenes' victory in the *Crown* trial undermined Aeschines' subsequent political and literary reputation, some of his merits were, nevertheless, praised by the ancient literary critics, in particular his powerful voice and delivery. The activities of his last years in Rhodes were recognized in the 3rd century AD by the sophist Philostratus of Lemnos, who included Aeschines in his *Lives of the Sophists* and credited him with being the first in a new generation of declamatory sophists, the founder of the so-called "Second Sophistic", which flourished in the 1st and 2nd centuries AD. Aeschines, like other members of the canon of ten Attic orators that had been firmly established by the 2nd century AD, served as a model of Classical Attic oratory, and the sophistic tradition continued in the schools of rhetoric through late antiquity and the Byzantine period down to the Renaissance. The speeches of the *Crown* trial continued to be the focus of attention, and if this was to the greater glory of Demosthenes, it helped to keep Aeschines in the forefront of study. The sophist Himerius, who taught rhetoric in Constantinople (AD 343–52) and Athens (AD 352–61), wrote a speech in the person of Demosthenes against Aeschines; George Chrysokokkes, the Byzantine schoolmaster, copied the manuscripts of Aeschines in the period 1420–28 for his Italian patron Aurispa; and the Cretan Demetrios Doukas assisted in the preparation of the first printed edition of Aldus Manutius in 1513. One final indicator of the continuing study of Aeschines is the collection of scholia to Demosthenes and Aeschines in the monastery of St John on Patmos.

MICHAEL J. EDWARDS

Biography

Born in Athens *c.*390 BC, Aeschines scratched a living as an actor and soldier until 348 BC when he was sent on an embassy to Arcadia. On another in 346 he incurred the enmity of Demosthenes, who charged him with treason. Aeschines successfully counterattacked with a speech *Against Timarchus*, and in 343 was acquitted after delivering his speech *On the False Embassy*. When Demosthenes was offered a crown by Ctesiphon, Aeschines attacked again with his speech *Against Ctesiphon*. Demosthenes successfully defended himself and Aeschines went into exile in Rhodes where he died *c.*322 BC.

Aeschylus *c.*525–456 BC

Tragedian

Aeschylus saw Athens victorious over the Persians in 490 BC and again in 480–479 BC. His tomb at Gela tells us that he fought at Marathon, but nothing about his drama. Supposedly he came from a distinguished family. He was invited by Hieron I to visit Syracuse in Sicily, and he wrote his *Women of Aetna* on the occasion of Hieron's founding of the city of Aetna. His plays were esteemed for their inspirational and educational value. In Aristophanes' *Frogs* (405 BC) the god Dionysus brings Aeschylus back from the dead so that the Athenians can enjoy good drama once more; Aeschylus claims that his *Seven Against Thebes* is "full of Ares" and that whoever sees it is anxious to become a warrior (*Frogs*, 1021–22).

Seven of Aeschylus' plays survive: *Persians* (472 BC), *Seven against Thebes* (467 BC), *Suppliant Women* (*c.*466 BC), the *Oresteia* trilogy comprising *Agamemnon*, *Choephoroe*, and *Eumenides* (458 BC), and possibly *Prometheus Bound*, though authorship of this play has been disputed. He is said to have written some 80 plays, and he won victories with about 13 of them. Legend has it that, after beginning to compete in 499 BC, he won his first victory in 484 BC and that he was triumphant on every subsequent occasion that he competed. Fragments exist of many of the missing tragedies, rarely extensive, except in a few cases (*Myrmidones*, *Niobe*, *Prometheus Unbound*). His satyr plays were highly regarded and the more substantial of his fragments are in fact from these (*Netfishers*, and *Theoroi*, also known as *Spectators at the Isthmian Games*).

Aeschylus generally wrote his plays in the form of a thematically connected trilogy, and the only trilogy from any of the ancient tragic playwrights that survives is his. This form allows the development of a theme, as in the *Oresteia*, with its admonition that the perpetrators of crime will be punished. This is called a violent grace, accorded by the gods to man to teach him to be wise, to learn through suffering (*Agamemnon*, 176–83). A family curse shows man's dependence on fate for generation after generation, and yet the responsibility for wrongdoing remains his. The lesson is an important one, and Aeschylus charts the transition from personal blood feud and murderous vengeance to the public law court. This trilogy was written two years after the democratic reforms limited the Council of the Areopagus to murder trials. Aeschylus shows respect for the Areopagus, but also seems to espouse the development towards democracy.

Aeschylus' plays include many exchanges between a single actor and the chorus. As much as one half of a play can be choral, and his choruses are particularly dramatic. It is easy to imagine the Persians appearing in their lavish costumes, and the demonic arrival of the Erinyes, or Furies, whose appearance we are told caused women to miscarry. Aristotle tells us that Aeschylus introduced a second actor and his later extant plays show more dialogue between two actors, and, after Sophocles introduced the third actor, sometimes three.

Of the three playwrights from 5th-century BC Athens whose works survive, Aeschylus' language is perhaps the most poetic, with his abstract usage, invented and rare words coupled with bold metaphors. He is certainly the most difficult to translate. He often takes an image and carries it throughout the play, or trilogy, as, for instance, in the *Oresteia* with the related images of net, hunt, blood, fertility, sacrifice, and war: public pursuits that lead to private disaster.

Alone of the three great tragedians, Aeschylus deals with a historical subject, the *Persians*, less than a decade after their defeat. He showed sympathy for the enemy, a useful quality for rising statesmen in the new democracy. In this work he also extolled the merits of democracy by comparison with the Persians, who were governed by a tyrant.

When Aeschylus died, a state decree was issued allowing his plays to be entered at the tragic festivals in competition with living playwrights. Aristophanes' *Frogs* shows us that he was still held in high repute after his death, since he is shown victorious over Euripides. Soon, however, Euripides became more popular. There are few quotations from Aeschylus in writings of the 4th century BC, and Aristotle says little about him. Around 330 BC the Athenian politician Lycurgus prescribed that copies of the texts of the plays should be deposited in the official archives, and that future performances should conform to these texts. The purpose was to safeguard the plays from adaptation and interpolation by actors and producers, of a kind to which they had already become vulnerable. These copies were lent to the Egyptian king, Ptolemy Euergetes I, and would have passed into the library at Alexandria, to form the basis of the critical edition made by the librarian Aristophanes of Byzantium (*c.*257–180 BC). Aristophanes divided the lyrics (previously written as continuous prose) into metrical cola. He also added brief introductory comments, probably making use of Aristotle's lost *Didaskaliai* (production records). Part of these comments survive in the *hypotheses* (plot summaries)

that were prefixed to the plays by later scholars in the Roman period. The composition of commentaries (or scholia) on the plays was begun in the Hellenistic period (by scholars such as Aristarchus of Samothrace, *c.*217–145 BC, and Didymus, ?80–10 BC). Further scholia were added in the Byzantine period.

Greek plays were popular in Rome. Quintus Ennius (238–169 BC) wrote a play called *Eumenides* that used characters from the *Oresteia*. Lucius Accius (170–?86 BC), in addition to plays based on characters from the *Oresteia*, also wrote *Persian Women*, *Prometheus*, and *Myrmidones*. For these Roman plays we have only the titles or a few fragments. In the imperial period Seneca (?AD 1–65) reworked the Greek tragedies in his ten extant plays. His *Agamemnon* and *Thyestes* are both derived in part from Aeschylus' *Oresteia*.

The selection of the seven plays by Aeschylus that we possess was probably made in the 2nd or 3rd century AD, and scholia were included for school use. After parchment gradually replaced papyrus (around the 4th century AD) the unselected plays gradually passed out of use. After the Athenian Academy was closed in 529, the classical texts disappeared from sight for several centuries and did not reemerge until the revival of learning in the middle Byzantine period, when they were copied from the uncial into the new minuscule script. Among the scholars who wrote commentaries and handled the texts of the plays the most important are Thomas Magister (late 13th century), Manuel Moschopoulos (*fl.*1300), and Demetrios Triklinios (early 14th century). Triklinios brought a new metrical awareness to the amendment of the text, in particular the lyrics. The plays that were most preferred by the Byzantines were *Persians*, *Prometheus*, and *Seven against Thebes*. Giovanni Aurispa brought the "Medicean" manuscript, written about 1000, from Constantinople to Italy around 1453. This included the seven plays that survive; it is our only source for *Suppliant Women* and *Choephoroe*. The *Agamemnon* is more fully preserved in two manuscripts from the 14th century and an autograph edition by Triklinios.

Texts of Aeschylus were available in Europe from the early 16th century (six of his plays were published in 1518) but he was not a favourite at this time. For the next 400 years interest in these texts was restricted to western Europe. Opera was founded at the end of the 16th century as a revival of Greek tragedy; in the 17th century Corneille and Racine both reworked Greek tragedy. Further interest followed in the 18th century with Goethe, Lessing, and Schiller, followed by Nietzsche and Kleist in the 19th century, and other reworkings throughout Europe and America.

In 1927 Eva Sikelianos revived performances of Greek tragedy at Delphi, beginning with *Prometheus Bound*. *Suppliant Women* was performed there in 1930. This tradition still continues at Delphi. Tadashi Suzuki took his *Clytemnestra* there, after it was performed in Toga, Japan, in 1983. That same year he did *The Tragedy* (*The Fall of the House of Atreus*) in Tokyo. The National Theatre in Greece regularly performs the ancient plays at Epidaurus, the odeum of Herodes Atticus in Athens, and elsewhere. Tony Harrison's and Peter Hall's *Oresteia* was performed in London in 1981 and at Epidaurus in 1982, the first imported production in that theatre.

In 1954 Dimitris Rondiris, a pupil of Reinhardt, established two festivals to revive ancient Greek drama on a yearly basis, one at Epidaurus, the other at the Herodes Atticus theatre in Athens. In 1980 Karolos Koun directed a fine production of the *Oresteia* in which Melina Mercouri starred as Clytemnestra. Earlier, in 1965, he had done an outstanding production of the *Persians*, which was also performed in London. In 2000, Katie Mitchell directed Ted Hughes's translation of the *Oresteia* in London. Spiro Evangelatos produced an *Oresteia* in 1990 with music by Theodorakis. This play has been performed in Greece since 1903, *Prometheus Bound* since 1917, and *Seven against Thebes* since 1925. *Prometheus Bound* was performed again at Delphi in 1995, ably directed by Theodoros Terzopoulos (he had previously done the *Persians* in 1990). Karolos Koun mounted a splendid production in 1975, and Giannis Tsarouchis a particularly artistic version in 1982. *The Persians* has also been popular and has been regularly performed in Greece since 1889, with an outstanding production by Terzopoulos in 1990 which emphasized the cruel suffering that revolutionary and idealistic defiance can entail. Yearly festivals that revive ancient Greek drama in addition to the ones listed above have occurred at Syracuse in Sicily since 1914 and at Delphi in Greece since 1981.

There have also been several films made of plays by Aeschylus, such as *Prometheus in Chains* (Greece, 1927) by Costas and Demetrios Gaziadis, and *Prometheus Second Person Singular* (Greece, 1975) by Costas Ferris, *Les Perses* (France, 1961) by Jean Prat, and *Notes for an African Oresteia* (Italy, 1970) by Pier Paolo Pasolini.

MARIANNE MCDONALD

Biography

Born at Eleusis *c.*525 BC, Aeschylus is the father of Greek tragedy. Seven plays survive. His drama is characterized by large issues and the splendour of his choruses. His trilogies showed divine justice acting over generations. He utilized spectacle to advantage, coupling it with equally spectacular poetic words. His plays have a particular appeal for contemporary audiences. He died at Gela in Sicily in 456 BC.

Aesop

Legendary fabulist

Although Aesop's very existence has sometimes been considered to be a fable, the many ancient and Byzantine statements about him may contain a historical nucleus, though this is hard to determine. The earliest reference to him is a brief passage from Herodotus (2. 134), which contains the following information: Aesop was a slave of one Iadmon from Samos; he was a fellow slave of Rhodopis, a *hetaira* (courtesan) living in the time of the Pharaoh Amasis (570–525 BC); and urged by an oracle, the Delphians paid compensation to atone for Aesop's death, which was received by Iadmon's homonymous grandson.

These data can be compared and combined with other testimonies. The indications of the place of Aesop's origin and activity vary; some locate him on Samos, others in Lydia, but most in either Thrace or Phrygia. Strikingly enough, all of these are peripheral regions of the ancient Greek world. This may tentatively be connected with the provenance of the fable genre from abroad (Mesopotamia). However this may be, Maximos Planudes' derivation of "Aesop" from "Aethiopian" is at any rate etymologically incorrect.

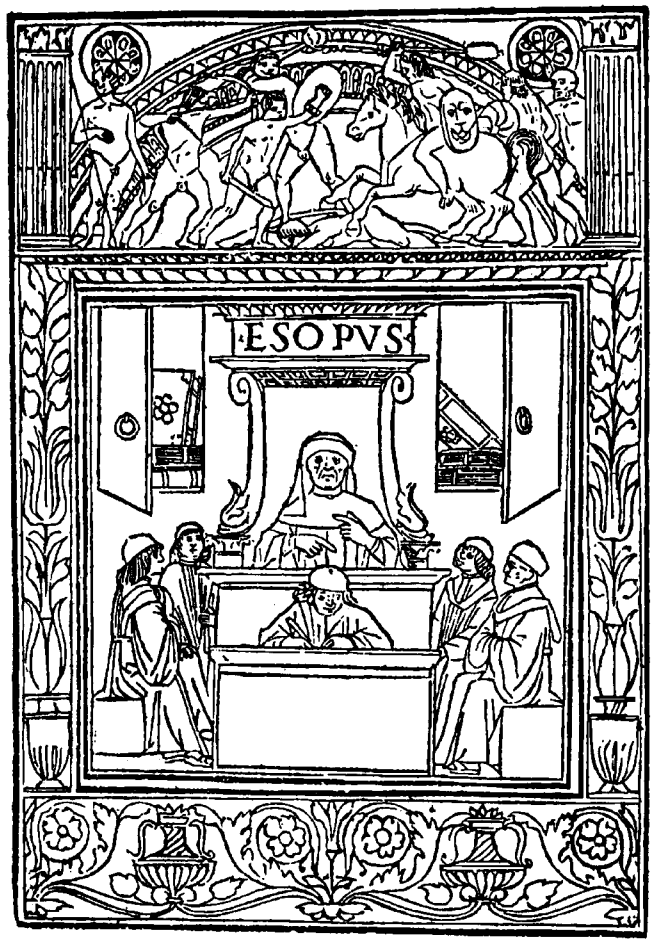
Instead of Iadmon, Aristotle (fr. 573 Rose) names one Xanthos as Aesop's master. More important than the latter's identity is Aesop's alleged social status: the emperor Julian (*Orations*, 7. 3) plausibly observes that Aesop, as a slave, could not speak out but had subtly to disguise his counsels in fables.

If Aesop really existed, he probably belonged to the 6th century BC. Eusebius of Caesarea even dates his death to 564 BC precisely. Herodotus implicitly connects him with Sappho, since he reports that it was her brother who redeemed Rhodopis. An inscription of the 1st century AD (*Inscriptiones Graecae*, 14. 1297) makes Aesop a contemporary of Pisistratus, whereas Plutarch (in his *Symposium*) has him converse not only with the equally legendary Seven Sages but also with Solon, and states that Croesus, the last king of Lydia, sent him as an envoy to Delphi.

This mission was allegedly to be his death, as is already implied by the passage from Herodotus discussed above. Aristophanes (*Wasps*, 1446f.) refers to a story in which Aesop was accused by the Delphians of the theft of a bowl dedicated to Apollo. Later testimonies explain that Aesop incurred the anger of the Delphians because he exposed their habit of greedily misappropriating gifts to the oracle; whereupon they falsely accused him of sacrilege, and put him to death by stoning and/or throwing him from the rocks (*Oxyrhynchus Papyrus* 1800, 2nd century AD; Plutarch; Lucian, Himerius, 4th century AD). He was, however, avenged by Apollo. This legend, which may reflect the ritual expulsion of a scapegoat, must have been well known by as early as the 5th century BC, as indicated by the very brevity of Aristophanes' and Herodotus' allusions. The story's popularity is also indicated by the application of the proverb "Aesop's blood" to persons involved in crimes difficult to expiate (Zenobius, 1. 47, 2nd century AD; Apostolius, 1. 73, 15th century).

Aristophanes (*Wasps*, 1448) adds that Aesop told the Delphians a fable about a dung beetle. Again, the conciseness of the passage shows that the playwright presupposed that the audience would be acquainted with the full story. An ancient commentator explains that Aesop (vainly) tried to prevent his execution by telling the Delphians a story about a tiny scarab who took a terrible revenge on the mighty eagle.

From the 5th century BC it became customary to connect fables with the name of Aesop. This was done in various ways: either Aesop was presented as the narrator of a fable on some occasion of his life, or he figured as a fable character, or the



Aesop: Venetian woodcut, 1491

fable was simply labelled as "Aesop's" or "Aesopic". All these ways of ascribing fables to Aesop occur for the first time in Aristophanes' *Wasps*. By the end of the 5th century BC Aesop's fables must already have enjoyed great popularity, as is clear from passages from Aristophanes and Plato. The former (*Birds*, 471) considers unfamiliarity with Aesop's fables to be a serious lack of cultivation, whereas the latter (*Phaedo*, 60) reports that they were versified by Socrates (who was unjustly condemned to death like Aesop). It is a matter of dispute whether or not these passages imply the circulation of a textbook with Aesop's fables in Classical Athens.

The popularity of Aesop's fables is also evident from archaeology. It is generally assumed that a red-figure *kylix* (drinking cup, *c.*450 BC; now in the Vatican Museum) depicting a hunchback speaking to a fox represents the fabulist in conversation with his favourite fable character. Later testimonies refer to statues of Aesop by Lysippus and Aristodemus and describe an allegorical painting of Aesop and his fables (Tatian, 2nd century AD; Philostratus' *Imagines*, *c.* AD 200; Agathias, 6th century AD). The fabulist was honoured also by literary monuments: apart from various biographical notes (in the *Suda* lexicon and prologues of fable collections) and a fictionalized *Life*, which will be discussed below, we have one fragment of an *Aesop* staged by the comedian Alexis (4th century BC; extant in Athenaeus, 10. 431).

The ascription of fables to Aesop soon became a standard practice, which lasted throughout antiquity. Fables somehow connected with Aesop's name occur in the works of writers from the Classical (Democritus, Aristotle), Hellenistic (Callimachus), and imperial periods of Greek literature (e.g. Galen, Dio of Prusa, Dionysius of Halicarnassus, Plutarch, Lucian, Diogenes Laertius, Libanius, Themistius), as well as in early Christian Greek (St Irenaeus, St Basil the Great).

The first to compose a fable collection (Demetrius of Phalerum, *c.*300 BC) also used Aesop's name as a kind of generic label. This was done by other ancient fabulists (Babrius and Phaedrus, his Latin *collega proximus*) as well, and has become customary ever since, as is clear from the habit of Byzantine authors of quoting from "Aesop's fables" (Michael Psellos, John Tzetzes, Eustathios of Thessalonica, Nikephoros Gregoras). Hence it has naturally, but mistakenly, been believed by some that the ancient so-called Aesopic fable collections, which are extant in many Byzantine manuscripts, were by the genre's founding father himself. This myth was, however, definitively unmasked by Sir Richard Bentley (1699), who mainly on internal linguistic evidence convincingly proved that the prose fables cannot have been composed before the Christian era; their author must remain anonymous.

Aesop's renown (according to some perhaps rivalling that of Homer) may be especially based upon the fables ascribed to him, but throughout antiquity and the Byzantine period his name is also connected with apophthegms and proverbs (in John Georgides, *c.*10th century; *codex Mosquensis*, 239, 14th century). His fame was further enhanced by the anonymous *Life of Aesop*, a biographical romance from the imperial Roman period that creatively combines traditional stories about the legendary fabulist with heterogeneous elements derived from various other sources, notably anecdotes about the Seven Sages and the Assyrian book of Ahiqar. Aesop is portrayed as a typical anti-hero, physically and socially inferior but mentally the master of his superiors, and as the champion of popular wisdom, problem-solving, and fable-telling. The text's structure is tripartite; the setting shifts from Samos via the Near East to Delphi. Part 1 relates how Aesop, dumb from birth and enslaved, is granted first the power of speech by the goddess Isis and then freedom by his master Xanthos because, respectively, of his faithfulness and cleverness, and how he reconciles his fellow citizens with their powerful enemy, King Croesus of Lydia. In part 2 Aesop, as a counsellor of King Lycurgus of Babylon, manages to escape a plot set up against him by his adoptive son Ainos ("Fable") and to win an enigmatic battle for his master against the Egyptian pharaoh Nectanebo. Part 3 is about Aesop's tragic end in Delphi (see above). He is, however, with divine approval, avenged by allied Graeco-Babylonian forces.

Of this highly original and at times scabrous text three different versions are extant, viz. the ancient *G* and *W*, and the Byzantine *Pl*, named respectively after the place where the manuscript was originally kept (Grottaferrata; also containing fables of Babrius), after its first editor (Westermann; Braunschweig, 1845), and after Maximos Planudes, who made a somewhat abbreviated version *ad usum delphini* which was to become an early printing bestseller, translated into Latin, German, French, English, Dutch, Spanish, and other European languages. Modern Greek versions are the anonymous *Life of Aesop the Phrygian* (Venice, 1783) and Andreas Moustoxidis's *Life of Aesop* (Corfu, 1857).

In antiquity and in Byzantine times it was told (Photios and the *Suda* lexicon) that Aesop rose from the dead and was reincarnated more than once. Even if one does not believe in metempsychosis, the story of Aesop redivivus aptly symbolizes the eternal resurrection of the creation of Hellas's famous fabulist.

Biography

The eponymous father of Greek fable. Little is known of his life, and indeed his very existence is in doubt. If he existed, it was probably in the 6th century BC. He was by tradition a slave, perhaps on Samos. Fables continued to be ascribed to Aesop throughout antiquity and have been popular ever since.

Aesthetics

Although the word "aesthetics" is itself derived from the Greek word *aisthanomai* ("I perceive"), it was not coined until 1753, by the German philosopher Alexander Gottlieb Baumgarten. Since then it has gradually come to embrace philosophies of both art and beauty (whether natural or created). This is not to say that the ancients did not have a tradition of what we understand by aesthetics, i.e. a philosophy concerned with the essence and perception of beauty and ugliness.

Apart from the evidence that is implied in their creative works, we are able to form some idea of the views on art and beauty held by the Greeks from at least four types of writing: literary criticism, art criticism, philosophy, and rhetoric. One general idea that emerges from this evidence is that to the Greeks art was a representation (*mimesis*) of life. This is evident from the description of Achilles' shield in *Iliad* 18 where the artist's depiction is praised for its faithfulness to life. This was true not only of the visual arts and works of literature, but even of instrumental music. However, what the Greek thinkers understood by *mimesis* was something much broader than mere copying. It could encompass a wide range of modes of depiction and symbolism that ranged from imitative realism to imaginative idealism and embraced different accounts of the artists' relations to their creations, circling around the polarities of nature and craft, inspiration and technique. Accordingly, ancient attitudes to the representative arts include many distinctive configurations of emphasis. As Aristotle says in the 26th chapter of his *Poetics*, the artist could represent men as they are, as they ought to be, or as they are thought to be.

According to Xenophon, Socrates regarded the beautiful as coincident with the good, while both of them are resolvable into the useful. We call something beautiful when it serves some rational end, be it human gratification or human security. He seems to have emphasized the power of a beautiful object to further the more necessary ends of life rather than the immediate gratification it afforded to perception and contemplation. For him, beauty was a relative thing. Unlike Plato, he did not recognize a "beauty itself" existing absolutely without any relation to a percipient mind. The *Memorabilia* (3. 10) records a conversation with the sculptor Parrhesius in which Socrates introduces two qualifications to the idea of representation: the sculptor can combine into one statue features that in real life belong to many people; and the artist represents not only physical features but also the soul.

The earliest aesthetic theory of any scope is that of Plato. According to him, reality consisted of forms or archetypes that were themselves imperceptible to the senses but were perceptible to the soul in its purest essence. But they were the patterns on which all objects of sense perception were modelled. Thus phenomena imitate the forms or participate in them. From the objects of sense perception the philosopher reasons to the pure forms of which they are mere imitations. But the artist merely copies the objects of sense experience without possessing a knowledge of their forms. What he produces is, thus, an imitation of an imitation. Because he did not possess the philosopher's knowledge of reality, the artist had no claim to be the teacher of men. Plato also believed that certain types of artistic production, such as those that portrayed the character and

actions of base people, were harmful to the moral and emotional integrity of their audiences. Even certain musical modes could induce laziness or incite people to intemperate actions. Accordingly, in formulating an ideal state, Plato, in the *Republic*, recommends rigorous censorship (or even expulsion) of the existing breed of poets and painters in favour of an ideal race of artist-philosophers whose creations should provide moral and political training.

Although Plato was inclined to the conception of an absolute beauty that took its place within his scheme of self-existing forms or ideas, it is not easy to determine exactly what he meant by beauty. Various definitions are rejected in his dialogues by the Platonic Socrates as being inadequate. The only notion of a common element in beautiful objects that we come across in his dialogues is proportion, harmony, or unity among their parts. According to the *Symposium*, true beauty is not something that one can find as an attribute in this or that beautiful thing. For beautiful things, although they partake of beauty, are not themselves "beauty itself". Eros or love causes aspiration towards the pure idea of beauty that Plato also identifies with goodness and truth. According to the *Phaedo*, the soul's knowledge of beauty itself results from recollection of its prenatal existence.

In several of his works Aristotle attempts to defend the claims of representative art as the basis of moral education, the origin of catharsis, and the instrument of character formation. He attempts to develop certain principles of beauty and art by scientific analysis. For Aristotle, just as for Plato, aesthetics was inseparable from morality and politics. In his *Politics* (8. 5) he dwells on the power of art to influence human character, and hence the social order. In the *Metaphysics* he tries to make a distinction between the good and the beautiful: the good is always found in action, whereas beauty may exist in motionless things as well. The good may also be called beautiful under certain circumstances, although essentially they are two different things. Beauty is also different from what is fitting, and is above the useful and the necessary. The pleasure it provides is of the purest kind. The universal elements of beauty are order, symmetry, and definiteness or determinateness (*Metaphysics*) as well as a certain magnitude (*Poetics*); an object should not be so large as to prevent a synoptic view of the whole, or so small as to prevent a clear perception of the articulation of the parts.

The more mystical writings of Plato, the *Timaeus* in particular, suggest a different approach to aesthetics based on the Pythagorean theory of the cosmos or ordered universe. This exerted a decisive influence on the Neoplatonists. Among them Plotinus (born *c.*AD 205) accorded far greater significance to art than did Plato. The essence of his philosophy is the desire to escape from the material world. According to him, *nous* or objective reason, which is self-moving, invests form on inanimate matter, thereby turning it into a *logos* or notion whose beauty lay in its form. Objects that have not been acted upon by reason are formless, and therefore ugly. The creative reason is absolute beauty, which Plotinus calls the more-than-beautiful. Beauty manifests itself in three stages: the highest is human reason; next comes the human soul, which is less perfect because of its links with the material body; lowest of all are the "real" objects. In other words, he explains the universe by a hierarchy rising from matter to soul, soul to reason, and reason to God, the final abstraction, without form or matter, i.e. pure existence. Only the spiritual world contemplated by reason is real, the phenomenal world being a creation of the soul and, hence, a thing without real existence, while matter is only a receptacle for forms imposed on it by the soul. Unlike Aristotle, he believed that a single thing indivisible into parts might be beautiful through its unity and simplicity. He accorded a high place to the beauty of colours in which material darkness is overpowered by light and warmth. According to him, art reveals the form of an object more clearly than ordinary experience does, and it raises the soul to contemplation of the universal. When the artist contemplates notions as models of his creations, such creations may attain to greater beauty than the products of nature. For Plotinus, the highest moments of life were mystical, and by this he meant that in the world of forms the soul was united with the divine or the "one". Since one loses oneself in contemplating an aesthetic object, aesthetic experience comes closest to mystical experience.

The influence of Plato is also manifest in the rhetorical treatise known as Longinus' *On the Sublime* (? 1st century AD). According to this author, "sublimity consists in a certain excellence and distinction in expression" and "it is from this source alone that the greatest poets and historians have acquired their preeminence and won for themselves an eternity of fame." According to him, the sublime not merely persuades but transports the audience out of themselves. It is thus a mystic experience, an ecstasy, which is why its effect is different from that of all merely technical skills. In the 7th chapter he says: "for by some innate power the true sublime uplifts our souls; we are filled with a proud exaltation and a sense of vaunting joy, just as though we had ourselves produced what we had heard." For him, the sublimity of a work is proved by its ability to stand repeated hearings and its unanimous recognition or universal appeal. In chapter 9 he describes the sublime as the echo of a noble mind. The sources of sublimity are: (1) the ability to form grand conceptions; (2) the stimulus of powerful and inspired emotions; (3) figures of speech and thought; (4) diction; and (5) composition. Although he makes several references to the visual arts, his prime concern is literature.

Among the Greeks, examples of art criticism are found in literary works, mostly from the later periods, which contain descriptions of works of art. One such work is Pausanias' *Guide to Greece* (2nd century AD); another is the *Eikones* by one of the Philostrati of Lemnos who appear to have lived in the 2nd–3rd centuries AD. The latter consists of two sets of descriptions in prose of pictures that the author professes to have seen.

There was a strong tendency among the ancient Greeks to connect both art and beauty to more general considerations of human needs and values, so that their aesthetics, so far from being isolated, was involved with the psycho-sociological aspects of culture. In considering questions concerning the origin, subject-matter, form, style, and effect of the arts, several Greek writers adopted a comparative approach. The elder Simonides described poetry as vocal painting and painting as silent poetry. Aristotle, in his *Poetics*, also makes frequent references to the visual arts; and so do the later authors of rhetorical treatises, even though their analogies are often misleading.

Christianity at first regarded the depiction of religious images as idolatrous because of the Old Testament's prohibition against graven images (Exodus 20: 1–5). This reservation was, however, overcome and a pictorial tradition was established by the 3rd century AD. It is in relation to this early condemnation of pagan idolatry and the consequent reluctance to depict sacred Christian figures and stories that early Byzantine art must be understood. Although many notable exceptions exist, figural scenes were usually avoided and were presented in an allusive symbolic mode or were embedded in complex programmes that rendered the veneration of single images practically impossible. From about AD 550 such restraint weakened, and in 7th-century church decorations small isolated panels depicting single figures begin to appear at or near eye level.

The representational theory of art was retained through the Byzantine period as well, and even hagiography emphasized the resemblance of the icon to the original. This naturalistic approach was, however, contradicted by the concept of bodily beauty as a reflection of the absolute beauty of God. The artists aimed at representing what was eternal, rather than what was ephemeral, and they therefore concentrated on the "spiritual" elements of the human body, the face and especially the eyes. The figures are frontal and stable, the opposite qualities being the marks of devils, barbarians, and the enemy in general. Being didactic in purpose, Byzantine art sought to convey its message through a symbolic language. Along with its historical place and time, each event depicted had its place in the ever-repeating cycle of the divine plan, thus conferring upon it a profound significance.

Aetolia

Region in central Greece

Aetolia is a region in north central Greece whose southern border is the coastline along the Gulf of Corinth. Its western border is formed by the Acheloüs river, which separates modern-day Greece from Albania and in Classical antiquity marked the division between Aetolia and Acarnania. In the 5th century BC an uneven line running from the area just west of Thermopylae in the north to Naupactus on the Corinthian Gulf in the south formed Aetolia's eastern boundary; its northern border abutted the kingdoms of Macedonia and Thrace. At present Aetolia and Acarnania, as the conglomerate Aitolakarnania, comprise the most westerly nome of central Greece; this nome lies between the Gulf of Patras and Epirus. Throughout the centuries the territorial boundaries of Aetolia have dramatically expanded or contracted in accordance with the ebb and flow of the Aetolians' political fortunes.

From the 1st-century-BC geographer Strabo we learn that in antiquity Aetolia fell into two divisions: Old Aetolia and New or Acquired (*Epiktetos*) Aetolia. The area between the Acheloüs and Euenus rivers is known as Old Aetolia. Its most striking geographical features are the complex series of lagoons of the Aetolian plains and Lake Trichonis. Old Aetolia included the city of Calydon, of great mythological significance as the scene of the tragic story of Meleager, Atalanta, and the Calydonian boar hunt. Moreover, Aetolian cities gained undying fame in the catalogue of ships in Book 2 of Homer's *Iliad* (lines 638–44); the poet reports that Thoas, son of Andraimon, led an Aetolian contingent of 40 black ships in the expedition against Troy. New Aetolia extended from the Euenus river eastwards to the land of the Ozolian Locrians. This region did not have the sort of prestige which Greek mythology bestowed upon Old Aetolia; indeed, the 5th-century BC Athenian historian Thucydides (3. 94) remarks that its rude inhabitants spoke a nearly unintelligible form of Greek and ate raw flesh.

Aetolia's period of greatest power and prosperity fell between the years 338 BC, when the victory of Philip II of Macedon over a coalition of Greek city states led by Athens and Thebes changed for ever the configurations of inter-state power relations in Greece, and 189 BC, when Rome imposed a harsh settlement upon the Aetolians in the aftermath of the Roman victory over Aetolia and its ally the Seleucid king Antiochus III. The Aetolian Confederacy (or *koinon*) held regular representative meetings in which federal magistrates were elected, had a pan-Aetolian sanctuary at Thermon, and conducted a common foreign policy.

Sometime around 300 BC Aetolia gained control of the venerable sanctuary of Apollo at Delphi. Aetolia's territorial extent in this period may be calculated on the basis of the number of votes which the Aetolians controlled in the Delphic Amphictionic Council. In antiquity Aetolia's claim to fame lay in the defence of the sanctuary in 279 BC against a Gallic attack. Although it is clear that the Phocians also played a significant role in the repulse of this Gallic incursion, the Aetolians claimed sole responsibility. Some 30 years after the invasion they reorganized the Delphic festival of thanksgiving on a grander scale and represented themselves as the heroic defenders of Hellenism against a barbarian menace. This propaganda apparently was effective: the 2nd-century AD traveller Pausanias (*Description of Greece*, 10. 19. 5) states that the Gallic attack of 279 BC was the gravest peril in all of Greek history. The historian Polybius (*Histories*, 2. 35. 7), writing in the mid-2nd century BC, reluctantly pairs the event with the great 5th-century BC Persian invasions of Greece (although he refuses to name the Aetolians as the authors of the sanctuary's preservation). Throughout its ancient history Aetolia had an uneasy relationship with the Macedonian monarchy, alter-

nately being its ally and its enemy. In the so-called Social War (220–217 BC) the Macedonian king Philip V stunned the confederation by striking deep into its heart with his sack of the federal sanctuary at Thermon.

Aetolia is a rugged land. The lack of geographical and climatic amenities enjoyed by other parts of Greece may give some help towards understanding the Aetolian Confederacy of the 3rd and 2nd centuries BC. The Aetolian economy was based on the annual conduct of war and raiding expeditions; in some cases Aetolia granted other Greek states immunity from its marauding expeditions through treaties of inviolability, or *asylia*. The Aetolian Confederacy was essentially a nation of corsairs and mercenaries. We have already noted the negative assessment of Thucydides. The Aetolians' propaganda centred on their exploits at Delphi in 279 BC must in part be viewed as an attempt to counteract their negative international reputation. In the 2nd century BC, Polybius, as a citizen of the arch-enemy of Aetolia, the Achaean Confederacy, delivered in his *Histories* the most scathing indictment of Aetolia in the literary tradition (see especially the opening of book 4).

Aetolia struck up an alliance with Rome in 211 BC against Macedonia. This act hardly enhanced Aetolia's international image, as many Greeks at this time viewed the Romans as uncouth barbarians. At the conclusion of the Second Macedonian War (200–196 BC) Romano-Aetolian relations broke down as a result of a disagreement over the terms of the treaty. Aetolia was deprived of cities which it believed rightfully belonged to it; and the disgruntled Aetolians called in the Syrian king Antiochus III against Rome, which led to the aforementioned defeat and harsh settlement of 189 BC. Aetolia would never regain its former international position.

Yet in its subsequent history Aetolia takes a conspicuous place in the Hellenic fight against foreign oppression. Early in the 13th century AD Aetolia was a bastion of Greek resistance against the coming of the Franks. Michael Doukas (Despot of Epirus 1204–15) wrested the western seaboard from Naupactus to Dyrrhachium, including much of Old Aetolia, from the Latin Boniface, Marquis of Montferrat. In the 18th century St Kosmas the Aetolian (1714–79) established schools throughout Greek-speaking lands in his fight for Greek Orthodoxy and the Greek language; he was eventually executed by the Ottomans and became one of the so-called Neomartyrs. Finally, mention must be made of Aetolia's part in the Greek War of Independence (1821–32), as well as in the tragic fate of the Romantic poet and philhellene George Gordon, Lord Byron. The Aetolians defeated the Turks at Karpenisi, and under the leadership of Markos Botsaris, Missolonghi heroically withstood several sieges. Byron committed his material and spiritual resources to the moderate prince Alexander Mavrokordatos and the Greek cause. But his frail constitution buckled under the cold Aetolian winter and he died at Missolonghi on 19 April 1824. Yet he soon became a Greek national hero and an inspirational force behind the defeat of the Turko-Egyptian fleet at Navarino in 1827, which assured the end of the Tourkokratia.

Much of Aetolia has remained untouched by modernization. The plains produce olives, currants, and some tobacco, while the mountain eparchies rely upon forest produce, much as did their ancient forbears. The region is for the most part rugged and forbidding; only the hardiest tourist with the stamina of Aetolia's intrepid 19th-century topographers Bazin, Leake, and Woodhouse is likely to penetrate its depths.

Summary

Region of north central Greece which became a federal state in the 4th century BC. Best known for its defence of Delphi against a Gallic attack in 279 BC. Aetolia was a centre of resistance to the Franks in the 13th century and to the Turks in the War of Independence. It remains largely untouched by modernization.

Africa, North

Ancient Greeks called Africa "Libya", after the name of a tribe in Cyrenaica. The term Africa is a Latin one, initially used by the Romans, especially for the region around Carthage. Libya, however, remained the preferred term in high-style Greek literary texts throughout the Byzantine period. The Greeks believed Libya to be a continent that stretched from the Red Sea and Sinai or Nile to the Pillars of Hercules, or straits of Gibraltar. Although Egypt was in a strict sense considered to be part of the continent of Libya, the Greeks did not normally include Egypt and Egyptians in the terminology for Libya and Libyans.

Although the ancient Greeks knew something of the vicinity of the upper Nile, and were familiar with an ethnic group known as the Ethiopians already in the time of Homer, their knowledge of the African interior remained limited. Greeks from Thera colonized Cyrene *c.*630 BC. Elites in its vicinity, including those in the nearby towns of Apollonia, Barka, and Ptolemais, continued to speak Greek and use Greek for written records at least until the Islamic conquest in the 640s AD, although the indigenous people, who presumably were the majority, continued to speak their own languages. A lively trade with peoples in the interior developed. Greeks normally confined themselves to coastal regions and traded ceramics, wine, and other goods for raw African materials, such as the highly prized plant called silphium that once existed in Cyrenaica. Some cities along the coast west of Cyrenaica, such as Oea, Sabratha and Leptis Magna, also received enduring Greek names, as in Tripoli, although they probably had Phoenician origins. Because of the nature of winds and currents, most shipping between the Levant or Greek mainland and Africa took a northern route, via the Sicilian coast, although navigation did cross from the Greek mainland to Cyrenaica via Crete, or to Egypt via Cyprus. West of Cyrenaica along the African coast, a few traders or seamen may have used Greek, but after the Roman conquest in the 2nd century BC elites and townspeople spoke Latin and some local dialects. A lively Greek Christian culture was still thriving in Cyrenaica at the end of the 4th century AD, however, as the writings and correspondence of Synesius of Cyrene, bishop of Ptolemais, attest.

The Vandal conquest of Africa ruptured the continuity of Roman control in the third decade of the 5th century AD, although their failure to seize Cyrenaica reinforced the cultural and linguistic separation of Cyrenaica (which remained Hellenic, as did Alexandria, in Egypt) from the Latin-speaking coastal areas further west. It immediately became a priority for Byzantine emperors to recover Africa, for reasons of strategy, economics, and prestige. In 468 the Byzantine emperor Leo I unsucessfully sought to reconquer Africa from the Vandals by authorizing a disastrous and costly naval expedition. Vandal naval raids against the Greek mainland and islands were an annoyance but had only a limited effect in the late 5th century. African refugees in Constantinople lobbied intensively for another military expedition. The Arian theology and clergy of the Vandals, who intermittently persecuted orthodox Christians, added an important ecclesiastical motive for a Byzantine reconquest. In the 6th century internal Vandal strife and a diplomatic peace with the Persians allowed Emperor Justinian I to shift resources westward. He appointed the extremely capable commander Belisarius to lead a naval expedition in September 533, which, in the following months, swiftly overwhelmed the Vandals, whose males were deported and whose government, church, and society were eradicated. Byzantine Africa continued to exist until its final conquest by the Muslims at the end of the 7th century.

Byzantine reoccupation brought part of Africa, especially the provinces of Africa Proconsularis and Byzacena, into a closer relationship with the Greek east than ever before. Although the language of the Church remained Latin, a number of Greek-speaking ecclesiastics and monks from the east settled or took up temporary residence or asylum or were exiled there by the imperial government. Greek-speaking officials and soldiers from the east added to this Hellenic element. Nevertheless, west of Cyrenaica, the littoral remained Latin-speaking and the inhabitants of the countryside probably continued to speak various Berber dialects. There was no mass migration of Greek-speakers to Africa in the wake of the Byzantine reconquest, although a few inscriptions attest to the presence of Greek-speakers. In addition to Africa Proconsularis and Byzacena, the Byzantine army reasserted control over much of Numidia, but only over fragments of Mauretania Caesariensis, and the tip of Mauretania Tingitana, part of what is now Morocco. Ties were also resumed with the bishops of Sicily, Italy, and Sardinia. For Justinian I and his contemporaries the reconquest of Africa was a sign of divine favour and an encouragement to additional territorial expansion in the central and western Mediterranean.

The Byzantine empire, however, lacked the financial and military resources to restore Roman Africa to its dimensions and prosperity of the 2nd and 3rd centuries AD. After the initial reconquest by Belisarius, the government failed to send its best generals and troops to garrison the region. From as early as 536, the slow and inadequate payment and provisioning of the soldiers led to serious military rebellions, in which some Berber elements joined. Berber raids spread insecurity and devastation, so compelling the government and inhabitants to devote extensive resources to the construction and upkeep of town fortifications and watchtowers. Justinian I and his successors also encountered difficulties with implementing their Christological policies in Africa. The African Church had strong local traditions of autonomy and adherence to its own strict policies, and preferred to look more to Rome than to Constantinople for cues in ecclesiastical matters.

By the late 6th century Berber raids had led the imperial government to create a new official, a kind of governor-general, the Exarch of Africa, with combined civilian and military powers. His seat was at Carthage and, although there was no conscious Byzantine effort to Hellenize Africa, the region did acquire a stronger Hellenic imprint. It was also a significant source of revenue, second only to Egypt, in its contribution to imperial funds.

Between 608 and 610 the African exarch Herakleios and his son Herakleios successfully rebelled against the usurper-emperor Phokas, using Africa as the springboard for their seizure of the imperial throne. For the first time in many years, the empire had an emperor whose spouse was from Africa, and although Herakleios' African wife Fabia/Eudocia soon died, ties between Africa and Constantinople remained close, if bittersweet, throughout the life of the Herakleian dynasty (AD 610–95).

The pattern of Muslim conquest in Africa between 643 and 698 was similar but not identical to that of western Asia and Egypt. It occurred in the midst of fiscal, political, ecclesiastical, and theological discord even more acrimonious than that which existed further east. Contemporaries found it easy to blame religious disputes for the problems in Africa, but no one could find a satisfactory way out of the difficult situation that still preserved personal property and integrity.

During the 7th century north Africa loomed larger than ever in the Byzantine worldview, but at a high price. Emperor Herakleios (610–41) had spent ten years of his life there and

had married an African landowner's daughter. He and his ruthless treasurer Philagrios, who was briefly exiled to Africa, became familiar with Africa's fiscal potential, which they and their successors utilized to full advantage. Given the very pressing financial needs for defending the Byzantine empire against the Persians and then the Muslims, the Herakleian dynasty naturally turned to Africa for tax revenues. The loss of Egypt in 642–46 meant that African revenues became even more important to the empire. The coming and going of exiles to and from Africa further alerted officials in Constantinople to the region's wealth. By squeezing north Africa for maximal fiscal revenues, the Byzantine authorities exacerbated the already acrimonious theological disputes and hindered the development of an effective defence against the encroaching Muslims. Byzantine policy aimed to spend the seized precious metals, coin, other portable wealth from local churches to fight the enemies of the empire, whether Persians or Muslims. Resistance to such policies from north African landowners and the Church took a number of forms, including the dissemination of hagiographic accounts as well as grumbling and open clashes with the secular authorities. What was Africa getting in return for the ever greater demands for revenue from the central Byzantine imperial authorities?

Byzantine relations with the Berbers had not been good in the 6th century. Memories of Byzantine trickery and the murder of Berber leaders poisoned, or at least complicated, the atmosphere in the 7th century. Yet no possibility existed for raising large numbers of Byzantine troops for the defence of Africa without using Berbers. There were not enough local Latin inhabitants for recruitment into the army, nor could they be drawn away from the empire's threatened borders in the Balkans, Anatolia, and Italy. Berber resistance against the Muslims was not cohesive or well coordinated and it too eventually failed.

At a time when there was the most urgent need for unity and commitment in Africa, Byzantine Africa was rent by political and ecclesiastical divisiveness. The Byzantine monk Maximos the Confessor devoted more time to resisting imperial theology on Christology than to raising popular resistance against the Muslims. By the 650s the Byzantine government was already conceding the loss or virtual loss of Africa to the Muslims, although Byzantine resistance would persist for another four decades. The finger-pointing had already begun as to who was responsible for the debacle, and individuals and factions were interested in making points rather than solving the problem.

A number of incentives motivated the Muslims to conquer Africa, eject the Byzantines, and neutralize or take the region's wealth. The Muslims had probably heard of a failed imperial plan to move troops from Numidia to help Egypt in 633 and may have wished to forestall any repetition or improved version of such an effort. They also did not want the Byzantines in Constantinople to draw on the revenues of Africa to finance their resistance to Islam in Asia Minor, or to use Africa as a base for naval attacks against Muslim-controlled Egypt or other coastal areas. By forcing the Byzantines to pay tribute or even just to defend Africa, the Muslims were depriving them of funds that would otherwise be used in the fight against Islam.

Byzantine Africa did not fall quickly to the Muslims, in contrast to Syria, Mesopotamia, and Egypt. Byzantine resistance continued for many reasons, including financial and strategic ones. The Byzantines, from the perspective of Constantinople, did not want the valuable African resources to fall into Muslim hands. Old Africa Proconsularis (modern Tunisia) was the only place where the Byzantines had any hope of stopping the Muslim advance; logistical problems and lack of Byzantine manpower made it impracticable to consider serious resistance west of Carthage. In this region, however, the Byzantines could still use their fleet and their proximity to Sicily and Malta to advantage. For the Byzantines, holding on to Africa was closely bound up with the prestige of the Herakleian dynasty.

The Muslim conquest of Africa was also more violent than that of Syria, Palestine, Mesopotamia, or Egypt. According to Muslim narrators, the conquest involved more slaughter in combat, more massacres and more mass captivity of civilians, and consequently, more terror and terror-induced flight. Although this may be a case of mere historiographical exaggeration, it may also reflect a greater degree of local resistance, and the fact that Constantinople tried to prevent local officials from making arrangements with the Muslims that might have drained imperial funds and infringed Byzantine sovereignty.

The Muslim conquest of Africa benefited from the momentum, prestige, and confidence that came from so many earlier conquests. The greatest technological assets the Byzantines had were their naval knowledge and fleet, neither of which was used to full advantage. No navy could save the north African interior from the Muslims. Growing apocalypticism may also have contributed to Muslim successes, while Christian apocalypticism probably reduced the strength of Christian resistance, spreading terror and even inducing resigned acquiescence. Only very rarely did the Muslims find willing cooperation from Graeco-Latin leaders in Byzantine Africa, who were willing to give up their localities and accept Muslim rule.

The Christian inhabitanrs of north Africa left no records of their experiences in those years. There are no reports of martyrdoms, in a land that had previously been replete with Christian martyrs. The absence of such records is also consistent with what happened in Syria and Palestine. The Latin and Greek Christian population of Africa did not welcome and was not indifferent to the Muslims. Their reaction was one of resistance or at least fear, and they made any accommodation with Muslims under duress. The Muslim conquest occurred at a moment of great Hellenic religious ferment in Africa, as Greek works such as the *Doctrina Jacobi nuper Baptizati* and the correspondence of Maximos the Confessor attest. Only a few echoes of that period, however, survive in the *Synaxarion* (church calendar of daily commemoration) of Constantinople.

The Greek-speaking population of Africa had never been large, and disappeared after the Muslim conquest, perhaps because it became indistinguishable from the remaining Latins, all of whom were called *Rum*. Many fled from Africa to Europe (to Spain, Italy, Sicily, or Malta), such as the young man who later became the renowned Hadrian of Canterbury in England; some perished, others assimilated. Africa was to become the staging-ground for Muslim assaults on Byzantine

Sicily and southern Italy between the 7th and 11th centuries. Although the Byzantines made a few raids against Muslim-controlled Africa, and later engaged in important diplomacy with the local Muslim rulers, for example in the 10th century, they never had the resources to consider a serious recovery of Africa after its loss in 698. North Africa was too large and too populous to yield to any deep process of Hellenization.

Summary

North Africa was called Libya by the ancient Greeks and Africa by the Romans. They and the Byzantines regarded all the land between the Red Sea and the Straits of Gibraltar as Africa, though Egypt was usually excluded from the designation. The first Greek settlements were made in the 7th century BC. Most of north Africa was Latinized by the Roman conquest, but the coastal towns of Libya were Greek-speaking until the Muslim conquest in the 7th century AD.

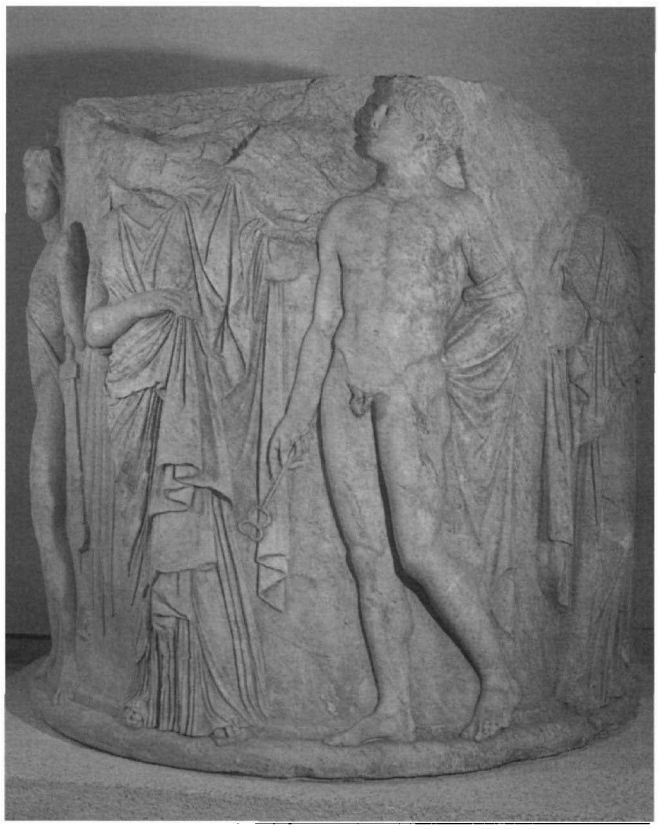
Afterlife

Greek beliefs in the afterlife were complex and contradictory, even no doubt within the same individual. We can only speculate about those that were current in the prehistoric period. Marine motifs painted on the surfaces of terracotta Minoan coffins known as *larnakes* have sometimes been fancifully interpreted as evidence that the Minoans believed in an afterlife that lay across the water. The fact that the Mycenaeans were prepared to clear away previous burials in so-called tholos (or beehive) tombs to make way for a new interment has been taken as evidence by some archaeologists that the Mycenaean corpse was believed to be sentient as long as the flesh remained on the bones. Conversely it has been suggested that the plentiful use of gold in Mycenaean royal burials may have been intended to preserve the body from physical decay, judged to be a necessary precondition for a healthy afterlife. The belief that the dead have need of their possessions in the world to come might account for the ritual slaughtering of animals at the time of burial – a practice for which there is evidence in protogeometric as well as Mycenaean times. Myths such as that of the sacrifice of Polyxena at the grave of Achilles have been taken to suggest knowledge of human sacrifice, conceivably practised with a similar object in mind.

It is only when we have written evidence to supplement the archaeological record, however, that we can begin to identify with some degree of certainty the beliefs about the afterlife that underlay funerary ritual. Undoubtedly the most prevalent, and one, moreover, that has persisted into modern times, has to do with Hades, the subterranean kingdom where the bloodless dead lead a cheerless and monotonous existence punctuated only by the appearance of new arrivals. In the earliest surviving description of the region as provided by Homer in book 11 of the *Odyssey*, every human being with one exception ultimately enters this kingdom, irrespective of their qualities. That exception is Menelaus, who is destined to live out eternity in a favoured region known as Elysium, which is situated at the ends of the earth (4. 561ff.). It is not his virtue that has earned Menelaus his privileged status, however, but merely the fact that he happens to be Zeus' son-in-law. Homeric Hades is therefore a place of equal misery for all and contains no trace of a system of punishments and rewards that are meted out to ordinary mortals, though a few who have sinned on a truly grand scale, such as Ixion, Sisyphus, and Tartarus, are condemned to suffer never-ending torment. The rest of the dead tend to confine themselves to sententious moralizing about their past. Greek tragedy occasionally intimates that kings preserve the same status in Hades as they did in life (e.g. Aeschylus, *Persians*, 691). Judging from depictions of the handshake motif in funerary art, a popular belief in Classical Athens was that upon arrival in the underworld a reunion took place between the recently deceased and their previously dead relatives.

Though belief in Hades probably remained dominant throughout antiquity, from the 6th century BC onwards it had to compete with more nebulous philosophical ideas about the afterlife. Orphism and Pythagoreanism, for instance, taught that the soul or *psyche* experiences incarceration in the body in this world and is released from its earthly constraints into its own element at the moment of death. Precisely what the *psyche* signified to these sects is unclear but it was without doubt a more personalized entity than a Homeric shade. The Pythagoreans also taught that the soul migrated to another body at the moment of death, since it is on a journey that will ideally lead it to a state of moral perfection. Attaining that state of perfection might therefore be expected to take several incarnations. The belief in transmigration (*metempsychosis*) seems to have been confined to philosophical circles. It is advanced in a number of Plato's dialogues, including the *Phaedrus*.

Mystery religions, of which the most important were the Eleusinian mysteries, so named because they were celebrated at Eleusis in Attica, held out the promise of a better afterlife in the case of those who underwent initation. So far as we know, however, the promise was not conditional upon a person's conduct in this life – a circumstance that outraged Diogenes the Cynic, who poured scorn on a belief system that maintained that ethical considerations play no part in determining a person's destiny in the afterlife. The only group that was excluded from initiation were murderers, but this may have been more on ritualistic than moral grounds since the shedding of human blood caused pollution.



Alcestis (centre left) is rescued from Thanatos (death, far left) by Hermes Psychopompus (the soul carrier) on the instructions of Persephone (far right) from the temple of Artemis at Ephesus, British Museum, London

From elsewhere, however, there is evidence to suggest that some Greeks at least came to believe that those guilty of serious crimes would be punished in the afterlife. A notable example is Pausanias' description of a painting by Polygnotus that depicted, among other things, a man who had mistreated his father being throttled by him in the underworld (10. 28. 5). In apparent reference to Orphic belief Aristophanes in *Frogs* (145ff.) comically suggests that "anyone who has stolen from a child, thrashed his mother, struck his father or sworn falsely" will be consigned to "everlasting mud". There are also a few references in tragedy to a post-mortem judgement (e.g. Aeschylus, *Suppliants*, 230f. and *Eumenides*, 269ff.; Euripides, *Helen*, 1013ff.). Though belief in a dualistic afterlife never became universal, it made significant inroads into the Homeric picture of an undifferentiated afterlife.

At no period did the Greeks trouble themselves to formulate a clear image of the rewards that lie ahead in the afterlife for those who manage to escape the fate reserved for the rest of mankind. Very likely they merely envisioned a world whose delights in general terms were identical to the best that is on offer in this one. Such seems to have been the idea behind Elysium, otherwise known as the Isles of the Blest, described by Homer as a place where life is easiest for men and where a gentle breeze always blows. A series of Classical grave reliefs depict the dead reclining, enjoying the pleasures of the symposium. Likewise Plato mocks the Pythagoreans for envisaging an afterlife consisting of "eternal drunkenness" (*Republic*, 2. 363c). The *Homeric Hymn to Demeter*, which incorporates the founding charter of the Eleusinian mysteries, merely states in vague terms that initiates will become "prosperous" (*olbioi*, lines 480–82). From the 5th century BC onwards a small minority of funerary inscriptions also refer to a celestial as opposed to a subterranean afterlife for the *psyche* located in the *aither*, i.e. the upper air. There is no suggestion that the dead retain any individuality or even consciousness once they have merged with this element, however. A few dead, notably Castor and Pollux, were transformed into stars, but again it is uncertain what existence they enjoyed as such.

Despite all their attempts to locate the dead above or below the earth, the Greeks found it difficult to envisage their dead as wholly incorporeal. In Classical Athens there is evidence of increasing concern with the physical well-being of the dead, deemed to be dependent upon offerings of food and drink that were placed on the tomb by their relatives, irrespective of whether the dead had been inhumed or cremated. Little can be deduced about eschatological beliefs from the method of disposing of the dead.

In rural Greece to this day beliefs about the afterlife constitute an amalgam of Orthodox Christian teaching alongside notions that have survived from antiquity. In particular the belief that the soul, though disembodied, continues to be dependent upon the living for the necessities of life remains widespread. Hence, food, drink, and clothing are frequently placed on the grave. Likewise candles and lamps are lit in churchyards in accordance with the belief that the other world (*allos kosmos*), like its Classical forebear, is a place of darkness. The dead can only reach Paradise, their ultimate goal, once the flesh has decomposed and the bones have become white and clean. In the preceding, liminal period memorial services are performed on their behalf to assist the deceased on their journey.

Agesilaus II *c.*444–359 BC

King of Sparta

Agesilaus was born to a life of controversy. The younger son of king Archidamus II, he was not expected to ascend the throne. He also suffered from a lame leg, a birth defect for which he tried to compensate throughout his life. He received the ordinary rigorous training of the Spartiates, which inculcated in him a sense of duty to superiors and the law. Extremely ambi-

tious, he harboured an arrogance that he unsuccessfully disguised under a diaphanous cloak of humility. His elder brother, king Agis II, died in 400 BC, which ignited an ugly contest for the throne. Agis' son Leotychides was accused of being illegitimate and, despite his handicap, Agesilaus advanced himself as Archidamus' true son. The furore was fuelled by Diopeithes, an expounder of oracles, who declared that the divine will rejected a lame king, for he would bring "unexpected afflictions and whirling man-killing wars". The result of this unsavoury contest was the recognition of Agesilaus as king.

Agesilaus owed his first important military command to his lover Lysander, the famous war hero. Agesilaus' first assignment was to free the Greek cities of Asia Minor from Persian rule. Accompanied by Lysander, he sailed in 396 BC. His first landfall, at Aulis in Boeotia, was in imitation of Agamemnon, who had sacrificed Iphigeneia there before continuing to Troy. When Agesilaus offered a sacrifice, contrary to native custom, Boeotian officials abruptly disrupted the ceremony. Agesilaus left for Asia Minor with feelings of foreboding and a fierce anger against Thebes.

Agesilaus accomplished comparatively little against the Persians. In 395 BC he unsuccessfully attacked Sardis, the principal city of Lydia, but in all he engaged in desultory operations that inflicted little damage on the Persians. He obviously had no strategic concept of how to defeat such a powerful enemy over such a large expanse of terrain. In any case, events in Greece put an end to his ambitious and unrealistic dream of conquering Persia. Thebes, Athens, Argos, and Corinth banded together to crush Sparta, and in response Sparta promptly recalled Agesilaus to meet the challenge. The Corinthian War (395–386 BC), as the ensuing conflict is known, severely strained Agesilaus' abilities and Sparta's resources.

Hurrying back to Greece, Agesilaus marched overland through the north until he reached Coronea in Boeotia. In August 394 BC he encountered a Theban and allied army, and in a furious battle made a tactical blunder that cost him dearly: he received several wounds, and his troops suffered many casualties. Despite this tactical and strategic defeat, in 391 BC he led a successful invasion of Argos and Corinth, in which he inflicted serious damage. In the following year he campaigned very effectively in Perachora immediately to the north of Corinth but again without decisive results. He fared better in 389 BC, when he defended Sparta's Achaean allies from their neighbour Acarnania.

Victory for Sparta, however, came from diplomacy not from warfare. In 386 BC the Spartan ambassador Antalcidas negotiated the King's Peace that ended the war between Persia and the Greeks. Yet those hoping that this treaty would bring peace were promptly disappointed.

As in 386 BC, Sparta resorted to diplomacy to win the peace. In 371 BC Sparta, Athens, and other Greeks renewed the common peace, but Agesilaus expelled Thebes from it. The irony of this diplomatic victory is that it led to military defeat on the field of Leuctra, which resulted in the downfall of Sparta. In the Peloponnese pent-up anger quickly vented itself: in 370 BC Elis, Arcadia, and Argos allied with Thebes to cripple Sparta as the surest guarantee of their mutual safety. Epaminondas led them into Laconia, where they spread devastation and liberated helots and others. He next led them to the liberation of Messenia, which broke the back of the Spartan economy while raising an implacable foe on Sparta's doorstep. Agesilaus rallied his countrymen through the ordeal, but could not undo the harm for which he was solely responsible. In the following years Sparta declined and Agesilaus languished. His last encounter with Epaminondas was at the battle of Mantinea in 362 BC, a Theban victory but in which the Theban leader was killed. Agesilaus spent his declining years as a mercenary in Egypt, dying in 359 BC on his way back to Sparta.

For all his military fame, Agesilaus never won a major battle. His diplomatic policies almost uniformly led to unnecessary disaster. When he assumed the throne in 400 BC he reigned over a Sparta supreme in Greece; at his death, owing largely to his failures, Sparta was beaten and isolated. His fame survived him, but his mark on history was scarcely stellar. Diopeithes' interpretation of the warning against a lame king had come true.

Agora of Athens

Marketplace of ancient Athens

The Agora was located to the northwest of the Acropolis. It was traversed by the Panathenaic Way and formed a large open square serving various public functions. Laid out early in the 6th century BC, it remained the focal point for Athenian commerce, culture, and politics for many centuries. It originally consisted of a square space defined by boundary stones (*horoi*). The first public buildings were erected on the west side and seem to have served the needs of the Council. When Pisistratus was in power at Athens, in the second half of the 6th century BC (566–510 BC), limited building activity took place in the Agora, which expanded gradually to the east and south. A large house-like building preceded the Tholos at the

southwest corner of the Agora, but its use has not been defined with certainty; it was probably built as the palace of the tyrants and later served the domestic needs of the Council. A fountain house, supplied by a terracotta aqueduct, appeared at the southeast corner of the square, while an altar of the Twelve Gods was established at the north. The street of the Panathenaia passed diagonally through the square, as it ran from the Dipylon gate to the Acropolis. Although the line of the road goes back to the Iron Age, when it led to the cemetery of Kerameikos, it was incorporated in the Agora during the 6th century BC.

The constitutional reforms of Cleisthenes at the end of the 6th century BC (508/07 BC) were followed by considerable building activity in the Agora. Several buildings accommodated the new government, including the Heliaea (the principal law court) along the south side of the square, and the Bouleuterion (Senate House), and the Royal Stoa (or Stoa Basileios) – headquarters of the king archon, where the laws were also put on public display – along the west side. Furthermore, shrines to the Mother of Gods, Zeus, and Apollo were built along the west side of the Agora. The Assembly of the citizens (*Ekklesia*), which used to meet in the Agora, found a new gathering place on the Pnyx Hill. The Persian attack in 480/79 BC left all these buildings in ruins, as was also the case on the Acropolis. Repair works, however, took place at the Bouleuterion, the Heliaea, and the Royal Stoa, which were shortly in use again.

After the Persian invasions and during Cimon's time, the architectural development of the Agora was remarkable. Cimon is also reported to have adorned the area with trees. From 479 BC to the middle of the 5th century BC, besides the reconstruction of the buildings destroyed by the Persians, the Painted (or Poikile) Stoa, the Tholos – a round building, functioning as the headquarters of the *prytaneis* ("standing committtee") of the Boule, where they also dined – the Herms, and the aqueduct to the Academy were built. The Painted Stoa is among the most famous buildings in the Athenian Agora. It was first known as Peisianaktios, after the man responsible for its construction, and was decorated with painted wooden panels by the outstanding painters of Athens, such as Polygnotus, Micon, and Panaenus.

The Periclean building programme in the middle of the 5th century BC did not include extensive activity in the Agora, because there was a shift of attention to the Acropolis and Attica. The work was therefore concentrated on repairs to sanctuaries and shrines, such as the altar of the Twelve Gods, the altar of Aphrodite, and the Crossroads Enclosure. Among the first new buildings were the temple of Hephaestus, which was not completed before the Peace of Nicias (421–415 BC), and the Strategeion, the headquarters of the generals.

Although the Peloponnesian War had affected the Periclean building programme leaving several monuments unfinished, a burst of building activity occurred in the Agora during the last 30 years of the 5th century BC, indicating an interest in civic structures. The new Bouleuterion was built immediately to the west of the old one; the Stoa of Zeus Eleutherios was a religious building and an informal meeting place of the Athenians; the South Stoa I, a public market building, also housed the officials responsible for the administration of the commercial life of Athens as well as the official weights, measures, and standards; the Mint was the public foundry that produced not only bronze coins but other material in bronze required by the state, such as weights and measures. These constructions were erected with limestone and brick, demonstrating the extent of Athenian resources even in times of war. The old Bouleuterion, known as the Metroon, did not go out of use, but housed the official archives of the city and the cult of Rhea, the Mother of Gods. The construction of the South Stoa and the Mint on the south side of the Agora made this area the official commercial centre, just as the west served administrative needs.

Besides the public buildings, excavations have brought to light many establishments for private industry and commerce, especially on the southwest of the Agora, such as the pottery and metalwork workshops, as well as sculptors' and marble workers' ateliers and shoemakers' shops. These workshops were in most cases attached to the private dwellings of the artisans and tradesmen. Moreover, wine shops and tavernas were found close to the east side of the Agora.

Construction works in the Agora were abandoned during the first half of the 4th century BC, because Athens was recovering from the Peloponnesian War. In the second half of the 4th century BC, when the city's economy improved, partly because of renewed activity at the Laurium mines, a new fountain house was built at the southwest corner, as well as a water clock, and the monument of the Eponymous Heroes was located in front of the Bouleuterion, the latter used for the posting of civic announcements. On the west side of the Agora was the shrine of Zeus Phratrios and Athena Phratria and the temple of Apollo Patroos. The square peristyle at the northeast corner of the Agora housed the law courts, as indicated by the finds of scattered bronze discs, which are identified as public ballots. Associated with the law courts is the state prison, recognized in a building located outside the southwest corner of the square, which dates from the middle of the 5th century BC.

The prosperity of Athens in the 2nd century BC and the benefactions of the eastern monarchs revived building activity in the Agora. The erection of the Middle Stoa, the East Building, and the South Stoa II created a complex, the South Square, which cut off the south half of the square from the north, changing the plan of the Agora. The most likely suggestion about the function of the complex is that it was a commercial centre, the two stoas serving as market buildings. Moreover, a two-storey colonnade, the gift of Attalus II, king of Pergamum (159–138 BC), housed stores and closed the east side of the main square. Also built at this time was the new Metroon on the west side of the square. The remodelling of the 2nd century BC gave a different appearance to the Agora, which it retained for the rest of antiquity. Its area was 50,000 square metres; all sides were now enclosed by colonnades; and the open central square became smaller, divided into two unequal halves by the Middle Stoa.

In 88 BC the Athenians sided with King Mithridates of Pontus in his revolt against Rome. For this reason Athens was besieged in 86 BC by Sulla, and several monuments of the Agora were damaged. Among them the Tholos, the southwest fountain house, the Heliaea, South Stoa II, and the East Building seem to have been destroyed; the Tholos was the only monument soon to be repaired. The south side of the Agora was later reoccupied by private industrial activities, such as

Agora: the Athenian Agora from the southeast with the temple of Hephaestus in the background to the left

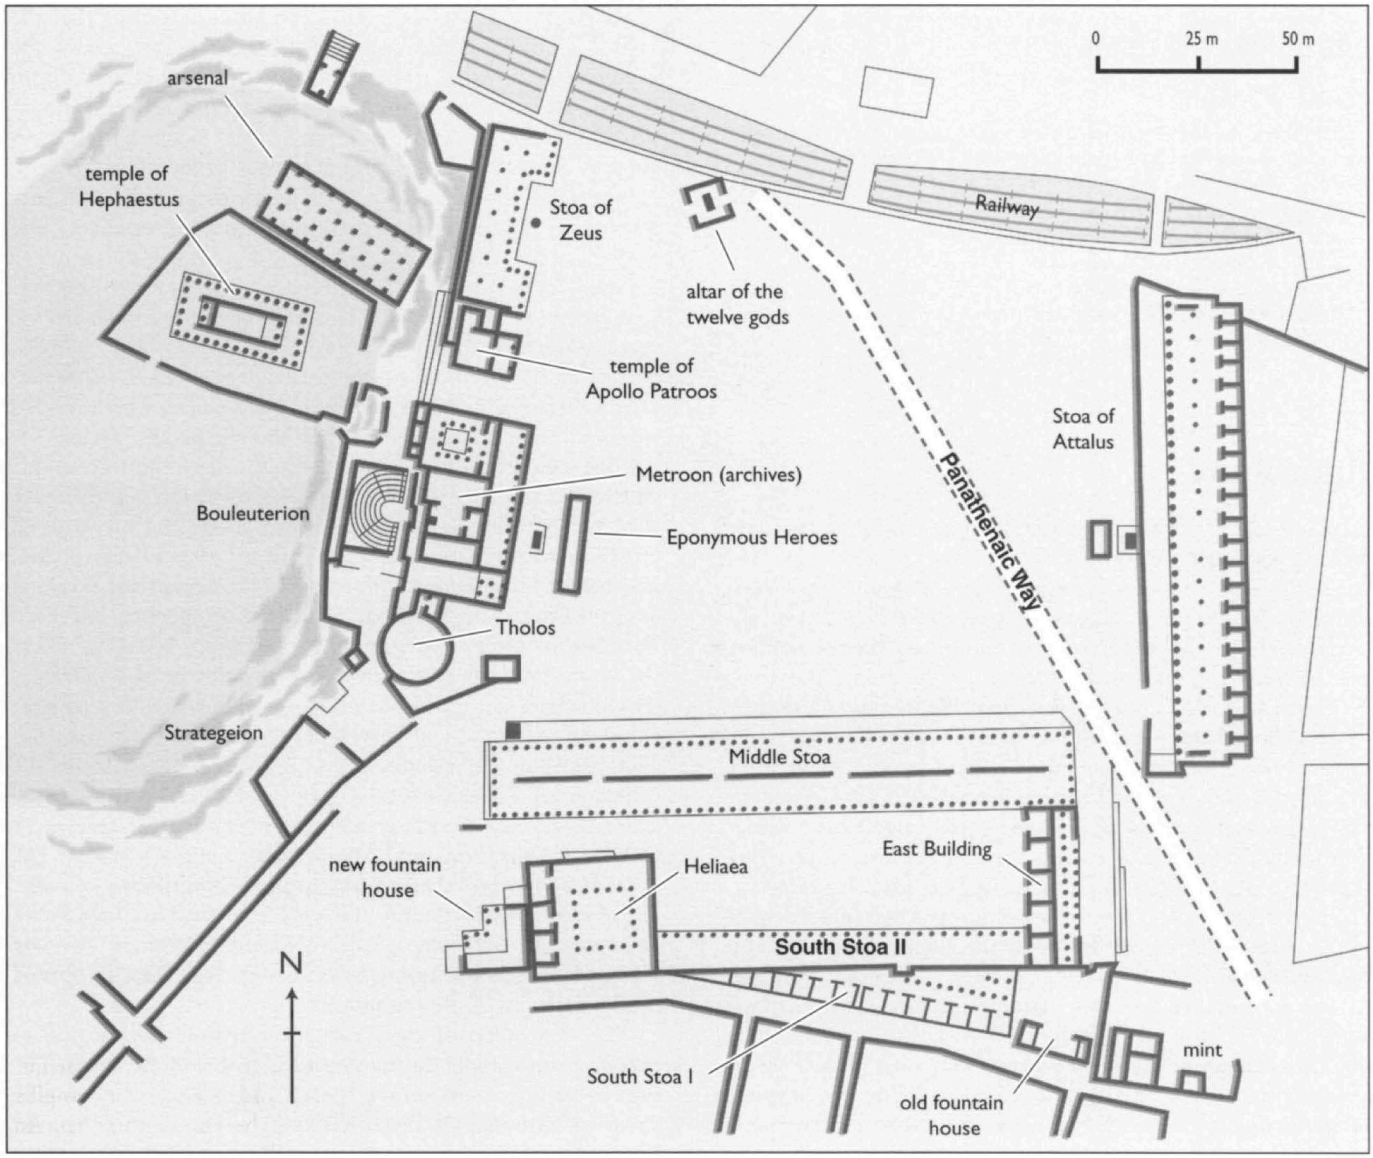
iron foundries, potters' kilns, and marble-workers' workshops. In the time of Hadrian this area was cleaned up and restored to public use.

An important development in the Agora during Roman times was the construction of a marketplace to the east, in the form of a large open courtyard surrounded by colonnades. The construction, which started with Julius Caesar and was completed by Augustus around 11–9 BC, affected the plan of the old Agora. Thus it was no longer thought necessary to maintain the central open square, which was soon covered by the Odeum of Agrippa, housing musical performances, and the temple of Ares; the latter was a 5th-century building standing somewhere in Attica which was dismantled and re-erected in the Agora.

Limited construction works took place in the Athenian Agora during the 1st century AD. The southwest and the southeast temples were erected from reused materials and the civic offices were built at the southwest corner of the square. Additions were also made to already existing buildings, such as an annex behind the stoa of Zeus, probably to house the imperial cult, a columnar porch to the Tholos, and a Doric propylon to the entrance of the Strategeion.

During the reign of Trajan Athens went through a period of prosperity. The earliest building in the Agora, dating to the 2nd century AD and situated along the Panathenaic Way just south of the Stoa of Attalus, was a public library, built by Pantaenus, the son of Flavius Menander. South of the library, a complex of shops was built in the middle of the 2nd century AD. An Ionic porch fronted the shops and was aligned with a similar one in front of the library, so as to create a fashionable street colonnade. Around the same time, during the reign of Trajan, the basilica at the northeast corner of the square was built. It was a three-aisled hall, which served as a law court, but also for commercial and administrative needs. Another 2nd-century addition to the Agora was a Nymphaeum, an elaborate fountain house, built west of the Panathenaic Way. It was begun during the reign of Hadrian, and completed in AD 140 under Antoninus Pius. A round building in front of the Stoa of Attalus, probably built to shelter a statue, dates to the Antonine period. At about this time the Odeum of Agrippa was rebuilt. Lastly, a library was erected by the emperor Hadrian (AD 117–38) to the east of the stoa of Attalus. Throughout the 2nd century AD the Agora flourished as a commercial and cultural centre.

The Athenian Agora was seriously damaged by the Herulians, a tribe who invaded Greece from the north in AD 267. They sacked and burned many cities, including Athens. The temple of Hephaestus survived, and excavations in the surrounding area indicate that several civic buildings on the west and north sides of the Agora, such as the Tholos, the



2. The Agora, Athens

temple of Apollo, the stoa of Zeus, the Royal stoa, and the Painted Stoa, continued to stand, though they were perhaps damaged.

Although the 4th century AD was a period of decline, limited reconstruction work took place: in the Agora the Metroon was restored, the wall of the Tholos was strengthened, and many of the houses were reoccupied. Towards the end of the century, in AD 395, Alaric and the Visigoths reached the walls of Athens; the literary sources disagree about the damage caused to the city, but excavations indicate that such buildings as the Tholos, the temple of Apollo, and the Stoa of Zeus, which survived the Herulians, were destroyed and abandoned.

After the departure of the Visigoths there was a new burst of building activity in the area of the old Agora. A large part of the square was taken up with a gymnasium complex and a porch, the so-called Porch of the Giants. Moreover, the eastern stoa of the library of Pantaenus was rebuilt with a second storey and served as a façade to a new public complex built on two levels.

The area of the Agora suffered again in the attacks of the Slavs who arrived from the north and destroyed the city in AD 582/83. There is scant evidence of reoccupation in the ruins of the Agora from the 7th until the 10th century AD when the town extended again to this area. The temple of Hephaestus was converted to a Christian church early in the 7th century AD, the building was reoriented, and an apse was added.

In later Byzantine, Frankish, and Turkish times the area of the Agora became a residential district. During the Greek War of Independence (1821–28) most of the houses in the area were destroyed; these were again rebuilt after 1834, when Athens became the capital of the modern Greek state.

ELENI ZIMI

Summary

The marketplace of ancient Athens to the northwest of the Acropolis. The Agora was first laid out in the early 6th century BC and remained the centre of the city's commercial, cultural, and political life

throughout antiquity. In later Byzantine, Frankish, and Turkish times it became a residential district.

Agriculture

In many regions of the Mediterranean agriculture underwent little change between antiquity and the modern age. The socioeconomic and technological developments that have affected the ancient traditions of agriculture have been relatively recent. Ethnographers have found a number of similarities between the cultivation techniques of today and those described by early Greek poets such as Homer and Hesiod.

Ancient and traditional agriculture in Greece has two major factors broadly in common: climate and terrain. The continuing impact of these factors, combined with the extensive survival of cultivating cereals, vines, and olives, has ensured that many techniques of ancient agriculture have survived for thousands of years. The pioneering work of Paul Halstead has revealed a great deal about the traditional agricultural techniques that have survived among the Greek peoples of the Mediterranean.

The recommendations of ancient authors on agriculture sometimes amount to little more than aphorisms or ethical guidelines. In some respects, practice may have differed from such advice. Ancient authors advocate that fields should be left fallow for a year so that the soil could be rested. But pressures on subsistence farms may have required the cultivation of land that otherwise might have been left temporarily idle. A compromise may have been found by planting different crops on land sown previously with, for example, cereals.

Some leases outlining the obligations for the cultivation of land have survived from antiquity. An example from Piraeus allows land to be ploughed for the nine years of the agreement, but in the tenth it was to be left fallow (*Inscriptiones Graecae*, ii^2, 2498). Such strictures indicate the importance attached to leaving land fallow. The need for such guidelines also suggests that farmers may well have avoided leaving fields fallow for a year.

The cultivation of cereals, vines, and olives has remained central to Greek agriculture from antiquity. The climate – broadly speaking, low annual rainfall, dry summers, mild winters – is typical of the Mediterranean. Some regions had superior soil, others more favourable microclimates. A rich, ruddy, fertile soil was a distinctive feature of Boeotia; Thessaly enjoyed extensive tracts of land ideal for the cultivation of cereals. Some regions were famous for specific types of produce: honey in Attica from Classical to Roman times, wine from Chios, Cos, and Thasos, and olive oil on Samos.

Although it is dangerous to generalize, it is clear that the spread of olive, grain, and vine cultivation throughout the Mediterranean world and the location of Greek colonies from the archaic period were not mutually exclusive. It is no coincidence that those areas colonized were seldom unable to support these three crops, and in particular the olive.

The olive was grown by most Greek communities. Highly resistant to low rainfall, but cultivable only at relatively low altitudes, olive trees were long lasting and required little maintenance. Olives could be harvested every other year, but the trees would take 10 to 15 years to reach fruit-bearing maturity. Harvesting took place in autumn or early winter, but the particular timing would have varied from region to region. Olives provided not only foodstuff but also oil, which in turn was used as a base for perfumes and medicines, as fuel for lighting, and for athletics and bathing. The relatively simple cultivation and harvesting of the olives was a less complex task than the production of the oil itself. Processing oil required crushing, pressing, and separation of the olive. Beam presses and rotary mills were the most common devices for crushing and pressing. The study of ancient olive presses has been informed by the examination of presses still used today, where the beam press has remained little changed from antiquity.

Vines were altogether a far more labour-intensive crop to cultivate, maintain, and harvest. The spread of viticulture into southern Spain and the Black Sea cannot be separated from the diffusion of Phocaean and Greek settlers respectively. Vine growing and so wine consumption was a major feature of Hellenic civilization, and the legacy continues today. The ancient symposium was centred around the drinking of wine, albeit diluted with water. The great festival in honour of Dionysus, the Anthesteria, celebrated in late February the new wine, and the wine storage vessels were symbolically opened on the first day of the ceremonies.

The centrality of agriculture to ancient Greek life is nowhere more apparent than in the cultivation of cereals. The two most important crops, barley and wheat, were usually sown in autumn. Of the different types of wheat, the best bread-making, light wheat (hexaploid) was grown in the Black Sea region where the cooler climate and higher rainfall were more suitable for this very popular but less hardy variety. Although wheat is generally more vulnerable to extremes in climate than barley, it is more nutritious and has a much higher yield. It was therefore widely preferred. But the higher-quality bread wheats were not as well suited to the climate in most regions of Greece, especially those in the south. In the second half of the 19th century wheat was far more widely cultivated than barley, on a ratio of 3:1. The evidence from Classical Greece indicates that barley was the more common of the two crops. The high population densities, patterns of landownership, and farm size may have affected the selection of barley as the preferred crop. Even the best breads in antiquity were more coarse than many of those today, while barley was a main ingredient for the large variety of "cakes" eaten in antiquity.

The selection of crops for cultivation was probably driven to some extent by expected yields. The vulnerability of cereals to frost when the crop was young and green, to shortfalls in rain when ripening, and to too much rain before harvest were far greater problems for wheat than for barley. An inscription

Agriculture: agricultural implements on sale at Elassona in Thessaly

from Eleusis recording the contribution in 329–328 BC of first fruits from Attica and the Athenian-controlled territories of Lemnos and Imbros suggests that more barley than wheat was dedicated at Eleusis. It is likely that the figures reveal that there was a poor harvest in Attica that year, and that wheat yields would have suffered more seriously than barley.

Agriculture in Greece rarely concentrated on any one of the three main crops. It is almost certain that most domestic Greek farms would have practised polyculture. Farmsteads devoted to the intensive production of one crop are known but exceptional; a large number of industrial "farms" are known at Chersonesus in the Crimea where estates were exporting their produce, probably wine. Legumes, pulses, and figs could have been grown in many areas. A variety of crops were probably grown on a typical farmstead. Intercropping, the planting of cereals, trees, vines, and pulses on one plot of land, was a likely feature of the Greek farm.

Archaeology cannot always confirm the nature of occupation in some rural establishments. A considerable amount of evidence indicates more permanent installations, some of which we might describe as farms. The Greek farm probably took many forms. People may have worked land close to their settlement, walking out to their fields daily or living in temporary shelters. Ancient and traditional Greek agriculture has generally centred around nucleated settlements, villages, or towns. Patterns of land tenure, the nature of agriculturally productive land, and sometimes issues of security have all influenced the location of settlement. It is now believed that a typical Greek household in antiquity would have had sufficient land to provide for its members. In some communities this may have been more an ideal than a reasonable ambition. Archaeological survey is suggesting that many ancient communities would have been of a size that could be sustained from local agricultural produce.

Excavation and archaeological survey in the rural landscape over the last 30 years have advanced considerably our knowledge of settlement in the countryside. Farms can be difficult to identify. Buildings with or without agricultural functions are often indistinguishable. But ancillary constructions such as threshing floors, olive presses, and field walls – all of which have changed little since antiquity – usually confirm the agricultural concerns of the building. Buildings with towers are a familiar type of rural building often used as a farm and are found throughout the Greek countryside. Aerial photography has revealed the extensive use of retaining walls in the Greek countryside and illustrates the extent to which more marginal land was exploited throughout history. However, it is very difficult, perhaps almost impossible, to date accurately such retaining or field walls.

The margins of survival for the subsistence farm may have been slim; a sequence of bad years would have had a severe impact on the household. Household size would have fluctu-

ated as children matured, moved away, or stayed at home and married, as children were born, and their grandparents died, as slaves were bought or sold.

The intensification of agricultural production by purchasing slaves or using animals for ploughing or transporting may have been too much of a burden for the small farm. Cooperation between neighbours or members of the extended family may have allowed resources to be used within rural communities. Smaller farms were probably unable to support extensive animal farming. Larger herds would have been tended on more mountainous or marginal lands, and there is plenty of direct and indirect evidence for the extensive use of such land in the Classical period.

Storing agricultural produce was one method of protecting against shortfalls in harvests, but such methods could provide only limited amounts. A number of farmsteads in the Greek countryside consisted of a house with a tower-like structure. Such features have survived in the Mediterranean from antiquity. It is almost certain that the tower structure on such farmsteads was used for storing produce and property and on occasion for security.

Human interference was probably the greatest threat to agricultural security, in both real and conceptual terms. The interruption of agricultural activities by warfare is a major feature in Greek history: perhaps most famously, the Spartans and their allies timed their invasions of Attica during the Archidamian War (431–421 BC) to coincide with the harvest period, a critical moment for those who were required to gather the crops. Such interruptions in the agricultural year, at their most extreme the cutting off of cities from the surrounding countryside by siege, presented the most common need for food supplies to be brought in from outside a Greek community.

The connections between life in ancient Greece and agriculture are difficult to separate; the Athenians found it difficult to move from the countryside into the city during the Peloponnesian War (Thucydides, 2. 16. 2). All communities in ancient Greece were dependent on agricultural produce for supplies of food (Plato, *Republic*, 369d, 371c, 372c–d); those communites that could grow all their own grain had considerable advantages over those who needed to import food supplies (see Thucydides, 6. 20. 4).

Self-sufficiency (*autarkeia*) was an ideal that features in many ancient Greek authors when assessing structures such as the household or the polis (Plato, *Laws*, 5. 744b–e). There are few extant works that treat explicitly the art of agriculture: Xenophon's *Oikonomikos* has a great deal to say about agriculture; Theophrastus heralds a higher level of scientific understanding of botanical observation (*Research on Plants* and *Plant Explanations*) in the later 4th century BC. But common to almost all Greek literature is the primacy of agriculture: the shield of Achilles (Homer, *Iliad*, 18. 541ff.) includes a rural scene of ploughmen wheeling their teams of draught animals; the Linear B tablets are full of ideograms and logograms that allow the scribes to maintain the palace accounts of agricultural produce.

The continuing importance of agriculture to Greek life is seen most clearly in the work of archaeological surveys carried out in a variety of locations such as Messenia, the southern Argolid, Nemea, Methana, Boeotia, Aetolia, Ceos, Melos, Crete, and Lesbos. Common to these studies is the observation of the human impact on the Greek landscape over a long period of time. The surveys present findings from geological prospecting to the results of research on recent land use. The collation of statistics, anecdotes, and records of agricultural activities and settlement during the 19th and 20th centuries has produced important information for both comparative and quantitative studies of Greek agriculture.

In many respects the continuities in practices and pressures can be seen stretching from antiquity to the present day. In the Byzantine period polyculture continued, dominated by grain and vine cultivation. In addition, specialist crops appeared such as flax and cotton; in some areas, such as the Peloponnese, silk was produced. There were few technological developments: horses were used in ploughing from the 10th century and windmills started to flourish in the 13th. Increased production still depended largely on extending the area of land under cultivation. Some areas of Greece, particularly the Peloponnese, enjoyed considerable agricultural prosperity in this period.

The main differences between the preindustrial and modern eras of Greece are the more recent technological developments – mechanization and advances in irrigation – and the new socioeconomic factors. On one level, these are the increasing demands of regional markets, and the wider economic context provided by the European Union. In antiquity the farmers of Greece generally operated to provide sufficient produce for their household. Few areas would have been devoted to providing produce for export. But the high quality of produce such as figs, honey, olives, and wine has been a consistent feature of Greek culture throughout history.

Akindynos, Gregory *c.*1300–*c.*1348

Theologian

A native of Prilapon (modern Prilep) in Macedonia, Gregory Akindynos received his formative experiences in Pelagonia (modern Bitola) on the Via Egnatia. He then proceeded to Thessalonica, where he studied under Thomas Magistros and the archdeacon Bryennios. He may have met Barlaam in Thessalonica in 1326/27. Akindynos then became a professor of grammar and tutor in Beroea. There he came into contact with St Gregory Palamas, who from 1326 to 1331 lived in a nearby hermitage. In 1330 Palamas gave Akindynos a copy of Nikephoros Gregoras's treatise on astronomy. In 1332, possibly at Palamas's instigation, he visited Mount Athos. He does not appear to have liked the intellectual atmosphere, or lack of it, on the Holy Mountain, but, unlike Barlaam, never spoke against the monks of Athos. In 1336 he received from Palamas a letter criticizing the anti-Latin treatises of Barlaam. At about this time he settled in Constantinople.

Up to 1341 Akindynos acted as a mediator between Barlaam and Palamas. He strongly advised Barlaam to desist from his attacks on the hesychast monks, though his advice was ignored. A letter from Palamas began to raise doubts in his mind, but he continued to support Palamas's cause, arranging for Palamas's summons to Constantinople to be reworded as an invitation. Palamas stayed with Akindynos on his arrival in the capital in December 1340–January 1341. Akindynos gave his full support to Palamas at the synod of June 1341, on the condition that Palamas would withdraw certain expressions in his work that Akindynos found unsound. Palamas appears to have suggested that he would indeed retract these expressions. He did not, however, compromise, and in fact forced the convocation of another synod in July 1341. Akindynos found himself de facto leader of the anti-Palamite cause.

The debate rapidly escalated into a full-blown controversy, fought with ferocious zeal. Akindynos survived at least one assassination attempt, thanks to the second thoughts of the would-be assassin. Akindynos undertook a prodigious campaign against the "new theology" of Palamas, and did so openly from June 1342. Palamas was arrested and imprisoned in September of that year. Akindynos was ordained in late 1344, being groomed, it seems, for the metropolitan see of Thessalonica. Akindynos was vindicated by the Constantinopolitan synod of October 1345, a decision that was upheld by the patriarch John Kalekas against both the wishes of the regent, Anne of Savoy, and widespread monastic pressure. The positions of Akindynos and Palamas were, however, reversed with the ascendancy of the emperor John VI Kantakouzenos, who finally took the city on the night of the 2–3 February 1347. Palamite theology was canonized by the synods of February 1347 and May 1351, and that of Akindynos condemned. Akindynos died before May 1348.

Akindynos's works are not abundant, and are restricted largely to polemic. He composed refutations of both Barlaam and Palamas. He couched some of anti-Palamite theology in poetic form, as in his *509 Iambics*. We are now in a position to assess an important part of his work following the publication of his *Two Refutations of the Work of Gregory Palamas Entitled "A Dialogue between an Orthodox and a Barlaamite"*. The main thrust of Akindynos's argument is that Palamas's assertion of a real difference between the divine essence and the divine energies or operations is inconsistent with the patristic witness. Akindynos's method is very straightforward; he tackles Palamas point by point, producing a host of patristic testimonies at every opportunity. Akindynos's work is heavy and repetitive, frequently digressing into areas the pertinence of which is obscure. He emphasizes the point that between God and the world there is no *tertium quid*, no *metaxi*. On grace, for example, he argues that there is hypostatic, uncreated grace which is the Son and the Holy Spirit, and created, non-hypostatic grace, and nothing more. He

characterizes Palamas's distinction between the essence and energies of God as a lapse into polytheism and an impious denigration of the divine unity. Furthermore, on Akindynos's reading, Palamas teaches that man participates not in God himself, but in some inferior divinity. There is, however, little real development in Akindynos's thought. His principal objection is quite simply that Palamite theology is new, and therefore inadmissible.

Akindynos was not a scholar of the stature of Barlaam, or indeed of Palamas, as he himself admits. His polemical works are more of an assembly of patristic texts than a sustained theological argument. This may be due to their quasi-official character, being prepared as they were at the request of the patriarch John Kalekas. Akindynos was without doubt sincere in his attacks on Palamite theology, deeming it unsound, dangerous, and innovative. The best rebuttal of that theology was, as he saw it, a demonstration of its inconsistency with the patristic witness. His condemnation at the Palamite councils of 1347 and 1351 has meant that his influence has been virtually nil, being perceptible perhaps only in the far more thoroughgoing defence of the divine unity found in the Byzantine Thomist Demetrios Kydones. Akindynos's innate conservatism and suspicion of change have, however, been shared by many representatives of the Byzantine and post-Byzantine tradition.

Biography

Born at Prilep in Macedonia, probably in 1300, Akindynos studied in Thessalonica where he mixed with both Barlaam and St Gregory Palamas. For a while he acted as mediator between them, but from 1342 was openly hostile to Palamas. With the accession of John Kantakouzenos as emperor in 1347 Akindynos lost favour and he died the next year.

Akropolites, George 1217–1282

Statesman, historian, and teacher

George Akropolites was born into an aristocratic family that had remained in Constantinople after its fall to the Latins in 1204. The numerous autobiographical digressions in his chronicle provide our main source for his life and career. At a young age he left Constantinople in secret for the court of the Nicaean emperor John III Vatatzes (1221–54), under whom the revived Byzantine empire in exile reached its political and cultural apogee. In Nicaea he studied with the most learned teachers of the time; he was taught rhetoric by Theodoros Hexapterygos and the famous Nikephoros Blemmydes introduced him to philosophy. Akropolites was later to become a teacher himself of philosophy and mathematics. His most famous students included John III Vatatzes's son and successor Theodore II Laskaris (1254–58) and the patriarch Gregory II of Cyprus (1283–89), both of whom praised his erudition.

An aristocratic origin and a superb education ensured a rapid career in the imperial service, which culminated in Akropolites's appointment as Grand Logothete or imperial chancellor of the empire, first in Nicaea and then in Constantinople. In the 1240s and 1250s he headed important diplomatic missions to Bulgaria and to the Greek despotate of Epirus, Nicaea's main ideological rival. An unfortunate accident during a surveillance mission in Macedonia led to his capture by the Epirots and a two-year confinement (1257–59) in Arta at the court of the despot Michael II (*c.*1231–71). A political opportunist, after his release from captivity Akropolites was quick to side with the usurper Michael VIII Palaiologos (1259–82) and supported the blinding of the legitimate child-emperor John IV Laskaris (1258–61). After the recapture of Constantinople in July 1261, Akropolites composed prayers of thanksgiving that were publicly read during Michael VIII's triumphal entry into the old imperial capital on 15 August. Michael VIII seems to have trusted Akropolites not only because of his administrative and diplomatic experience, but also on account of his kinship with the Palaiologan family. As a Grand Logothete, Akropolites led the Byzantine embassy that concluded the doomed Union of Lyons (1274) subjecting the Orthodox Church to the papacy. He personally took a solemn oath on behalf of Michael VIII, recognizing the primacy of the Roman curia in matters of both doctrine and administration. He died in 1282 after an embassy to Trebizond that he had led in the same year.

George Akropolites's renown lies less in his activities as a teacher and a diplomat than in his authorship of an important chronicle covering the period from 1203 to 1261. The chronicle is written in a classicizing, yet simple, concise, and unencumbered style. In this respect he stands in stark contrast to subsequent Palaiologan historians such as, for example, Nikephoros Gregoras and John Kantakouzenos, who closely followed Classical models. His chronicle is the main source for the history of the Byzantine splinter states of Nicaea and Epirus in the period between the fall of Constantinople to the Latins in 1204 and its recapture in 1261. Despite his claims for historical objectivity, Akropolites was far from a dispassionate observer of his times. The time and circumstances of the chronicle's composition (between 1261 and 1267) influenced strongly the historian's verdict on the main political figures of the period. His point of view is always pro-Nicaean, pro-aristocratic, and pro-Palaiologan. He consistently played down the imperial claims of the rival despots of Epirus and mistrusted the Bulgarians and Serbians. He praised John III Vatatzes as a consummate diplomat and military commander, but his son and heir, Theodore II Laskaris, is the anti-hero of the chronicle. The historian deeply disliked his anti-aristocratic policies, his autocratic tendencies, and his irascible and suspicious temper. He left a vivid description of how Theodore II punished him with 24 lashes after a disagreement. The emperor's negative characteristics make Michael VIII Palaiologos and his new regime appear in the best possible

light. The chronicle ends with a reference to a lost oration written by Akropolites and exhorting the emperor to declare his firstborn son, Andronikos II, co-ruler.

In addition to the chronicle, George Akropolites wrote rhetorical and theological works. He composed a funeral oration for John III Vatatzes's wife Irene Laskaris in 1239 and for the death of the Nicaean emperor himself in 1254. During the period of his captivity in Epirus he wrote two seemingly anti-Latin theological tracts on the procession of the Holy Spirit. Although these treatises repeat many of the traditional anti-Latin arguments, Akropolites made an effort to accommodate the opposing views. In particular, he pointed out the fact that both Greeks and Latins were united by the common name *Romaioi*, or Romans. His son, Constantine Akropolites, also rose to the rank of Grand Logothere and wrote numerous lives of saints and other works.

DIMITER G. ANGELOV

Biography

Born in Constantinople in 1217, George Akropolites studied in Nicaea under Theodoros Hexapterygos and Nikephoros Blemmydes. He himself became a teacher of philosophy and mathematics but then switched to the imperial service, becoming Grand Logothete and a senior diplomat. Author of an important chronicle of the years 1203–61. He died in Constantinople in 1282.

Albania

The modern Albanian state came into existence in 1913 in the final stages of the dissolution of the Ottoman empire. The territory has always been subject to Greek influences, and there has always been a Greek-speaking minority in the country. The history of Greek settlement in the region is very controversial and has been dogged by political factors, mostly about the relative degrees of Greek and Illyrian influence in southern Albania and the nature of the tribes that lived there. The geographer Strabo noted that many of these tribes were Epirote and could probably speak some Greek. These people have generally lived in the south of what became modern Albania, in the territory known to Greeks as *Voreio Ipeiros*, northern Epirus. They are probably descended from bilingual ancient tribes who inhabited the area in later antiquity, with additional influences from Greek-speaking labourers settled there by the Ottoman Turks, remnants of ancient Greek coastal colonization, mostly from Corfu, and some emigration of Greek communists and their families after the end of the Greek Civil War in 1949. Greek speakers can also be found in Berat, Tirana, and a number of other Albanian towns. The traditional Greek community in Korça, known to the Greeks as Koritsa, has gone into rapid decline since World War II, but a strong Greek presence remains in many rural areas in the southeast of the country.

In Ottoman times Greek was widely used as the language of business and government in Albania, but it never had much popular presence north of the Shkumbini river in the traditional Albanian heartland. Under the monarchical regime of King Zog in the 1930s Greek-language education was repressed, though the designation of Greek-minority areas recognized by the communist regime of Enver Hoxha at first offered some hope of improvement. But although a few ethnic Greeks rose to high positions under communism, particularly in the defence ministry and secret police, the majority of Orthodox rural villagers were subject to discrimination on grounds of race and religion. This process accelerated in the last years of the communist regime, when, in the pro-atheism campaigns, the Orthodox Church in the south was attacked and many church buildings were closed or desecrated.

With the end of communism in 1991, the position of the Greek minority improved somewhat, and a human rights association, OMONIA, won freedom of religion and of political assembly from the disintegrating one-party state. But the political turmoil in the Balkans that everywhere accompanied the end of communism also affected southern Albania, and the Greek minority began to leave for Greece in a process of mass emigration as soon as they were able to do so. This has resulted in depopulation of a number of traditional Greek centres, particularly the coastal strip between Sarande and Himara. Many ethnic Greeks from Albania have settled in cities in Greece, and Greek-language newspapers have started for them in Athens and Thessalonica. At the same time, there has been steady Greek business investment in Albania, mostly in the food, construction, and tobacco industries. Greek education has developed on a private basis in Albania since 1991, but there are still difficulties with the provision of public education. The position of the Church has much improved, with Greek-speaking priests in post in many places, although many controversial issues still remain, mostly connected with what Albanians see as excessive "Greek" dominance of the hierarchy. Many church buildings have been well restored, and some new churches are under construction. Priests have returned to most parishes. In the uprising in spring 1997 that overthrew the government of Dr Sali Berisha ethnic Greeks played an important part. There are many people with some Greek blood or connections in the governing coalition that came to power at that time.

Alchemy

Despite its Arabic prefix, the word "alchemy", like "chemistry", appears to be derived from the Greek root *cheo*, meaning "I pour", and its ostensible purpose is the transmutation of metals. As Jung and his followers have shown, however, the process was often treated by its more erudite exponents as a symbol of therapeutic operations on the soul. Mircea Eliade has demonstrated that in many ancient cultures the artisan enjoyed the reputation of a sorcerer, and was credited with skills beyond human science. Thus in Greek mythology Prometheus, the discoverer of fire, is the creator of human beings, while two smiths, the mortal Daedalus and the god Hephaestus, were said to have fashioned animated creatures. It is striking that all suffered injury as a consequence of their follies or misdemeanours; Zeus reserved the severest retribution for the Titans, who invented iron weapons in their war against the gods. The literary tradition pays little honour to the Cyclopes who stoked the fires of Aetna, or to the Telchines who combined the arts of witchcraft and metallurgy in Rhodes. In Israel, where all images were forbidden, there could hardly be such a thing as a pious craftsman: in the apocryphal Book of Enoch the use of stones and metals was traced back to the fallen angels, while in Genesis 4 all brass and iron artifacts, as well as musical instruments, were invented by the posterity of Cain.

The first Greek to display the classic features of the alchemist is Empedocles (*fl.* 480 BC), whose theory that every natural kind is formed by a specific combination of the four elements appears to have been the basis of his pharmaceutic remedies for disorders of the soul. The story that he died by leaping into the crater of Aetna, leaving only a golden sandal, is consistent with his magian character. Nevertheless, the first alchemical literature is attributed to the atomist Democritus and his school. He himself is credited with four treatises on the tincture, or immersion, of gold, silver, stones, and "purple", while fragments survive of a fifth on *Physical and Mystical Matters*. These overlap with the *Baphika,* or *Tinctures*, which has survived under the name of his pupil Bolus, though certain parts at least must date from the early Christian era. This maintains that every natural substance can be produced by the application of a tincture (*baphe*) to iron, copper, tin, or lead. Tincture is the addition of a solvent to a metal, which precipitates new substances according to a fixed succession of colours (black, white, yellow, and red). These correspond to the four elementary metals, but even these are reducible to lead, which, when converted to its liquid state by blackening, or *melansis*, is the prime matter of all the elements and the basis of all ensuing transformations. To know what one is making, one needs to be acquainted with the combinative properties of the reagents, or, as Bolus says, their sympathies and aversions. Sulphur, which is said to evince an extraordinary affinity with metals, is the most potent of the additives, but the ingredients of the process also include a golden alloy, Pontic rhubarb, and Italian wine.

This religious and anthropomorphic imagery, so alien to the style of the real Democritus, is justified by an appeal to books allegedly deposited in a temple by the Persian sage Ostanes. Despite this, the majority of relevant documents are papyri from Egypt, and they leave little doubt that the poetry of the Greek alchemists originated there. The esoteric lore of Ptolemaic and Roman Egypt was collected in the *Hermetika*, so called because its contents were attributed to Hermes Trismegistus; it was he, or rather his Latin equivalent Mercury, who gave his name to the liquid essence that later alchemists used as the catalyst in their experiments. The most remarkable symbol of transformation in the philosophical portions of the *Hermetika* (often arbitrarily separated from the esoteric writings) is the *krater*, or cup, of Treatise 4, which conflates the alchemist's crucible with the mixing bowl of Plato's Demiurge (the creator of the universe). It is possible that the Egyptian name Poimandres, given to the self-transforming Mind who imparts the initial revelation in Treatise 1, commended itself to the Greeks because of its likeness to the word *poimandria* ("cauldron"). Though nothing survives in extenso under Hermes' name, he is mentioned in extant treatises as the writer of authoritative works.

The Hellenization of Egyptian literature was partly the work of Jews, and thus one is not surprised to find a papyrus which conflates the wisdom of the pharaoh Kufu with that of the Hebrew Sabaoth. No doubt it was under Jewish influence that the goddess Isis, in another alchemical papyrus, becomes a pupil of the angel Amnael and gives instruction to Horus in the role of a prophetess. Since Jewish writers generally saw cunning as a property of women, they attributed the invention of the chief alchemical instruments to Maria, another prophetess and a pupil of Ostanes. Her devices included the alembic for distillation, the conical pot, or *phanos*, for sublimation, and another vessel, the *kerotakion*, for change of colours. Sulphur again is the element to which these new refinements are applied. Since the Democritean corpus does not allude to Mary, we may assume that she is a later figment; the readiness with which this alien woman was admitted into the canon is an indication that alchemy had already become a syncretistic faith.

Most of our information about Mary comes from the pagan Zosimus of Panopolis (*fl.* AD 300) in Egypt, whose works are both the most copious and the most interesting vestiges of the ancient practice. The scholarly Neoplatonist Olympiodorus in the late 4th century thought them worthy of a philosophical commentary. Yet Zosimus, for all his pretensions, offers no philosophy in the strict sense, but rhetorical accounts of private visions, which leave us doubting whether they are remembered or imagined, and whether he is recounting a chain of episodes or describing one event in different ways. The usual polarity between the dense substrate and the fluid solvent is presented in such a manner as to make the first analogous to the body and the second to the soul. The self, which is both the subject and the goal of transformation, is represented as a man of various metals, who stands beside the crucible as a priest before an altar, then assumes the role of victim by dismembering and devouring his own flesh. This figure (the homunculus of Goethe and Paracelsus) is identified with Adam, who, with a clear allusion to the book of Genesis, is styled the virgin earth in Zosimus' *Treatise on the Omega*, where the experiment

culminates in an (uninterpreted) vision of the Son of God. We may assume that mercury (or honey, as it is also called) is the object seen with the outward eyes, but of course this is merely the symbol of a mental revelation, which enables the philosopher to return to his proper dwelling place, escaping the fatal influence of the stars. Though Jung may be right to understand these visions as a manifestation of archetypal images, their content is (as one would expect) determined by the literary traditions that were available to a mystic of that era. With the Jewish and Christian vocabulary are mingled the names of Enoch, Zoroaster, and Ostanes, but the stories of Jewish captivity under Nebuchadnezzar (the statue of diverse metals, the blazing furnace, the degradation of the king) are surely the most important prototype.

Zosimus, like the Gnostics of the 3rd century AD, relied on a lost compilation by Nicotheus, "the Hidden One", and alchemy appears to be entwined with the very roots of the Christian heresy (*Omega*, 11; cf. Porphyry, *Life of Plotinus*, 16). The (Phrygian) Naassenes of the 2nd century derived both matter and spirit from a "single blessed substance", and maintained that the soul is in constant oscillation between the two. The first man (whose ethnic character is disputed, as in Zosimus) is called Adam because he is present in every one of us as a living stone of adamant. Hermes is the spiritual demiurge who effects our liberation, while the mutilated deities Attis, Osiris, and Dionysus offer symbols of rebirth. The last named should remind us of the notorious Greek myth in which the Titans tear apart and eat the infant Dionysus, son of Zeus. After Zeus destroys them with a thunderbolt, humanity is created from their ashes, owing its divine spirit to Dionysus and its vices to the intractable Titanic residue.

Alchemy became the guiding principle of a universal science, which allotted the names and colours of different metals to the four humours, the seven ages, and the planets, which were thought to influence both. In addition, the alchemist was required to be a skilled herbalist and an expert in the medical and prophylactic properties of gems. Affinities were easily discerned between alchemical symbolism and the New Testament, where Christ is both the apex and the foundation of a temple which is identical with the body and yet made up of "living stones". Synesius of Cyrene (*fl.* AD 400) wrote a commentary on the Democritean corpus, while the notion of a single blessed substance that "becomes all things" was adapted to meditation on the Trinity by Evagrius (*Epistle* 29). Yet a discipline that purported to derive its code from nature could transcend not only the bounds of race and Church, but those of orthodoxy and heresy. Book 9 of the 13th-century epic *Parzival* by Wolfram von Eschenbach alludes to a legend cherished by the Cathars, and therefore perhaps of eastern (Bogomil) origin, according to which the Holy Grail was a stone cast out of heaven and assigned to the custody of fallen angels. Being thus an emblem of both Christ and Adam, it is able, when the proper question is put to it, to heal the bodily ailments which result from the transgression of the soul.

The ideal of Renaissance alchemy, the union of the personality through the "conjunction of opposites", is derived from Arabic sources such as the Tabula Smaragdina. These in turn look back to a fabulous epoch of Byzantium, giving the name of the emperor Heracleios to the tutelary power of the planet Mercury, and also to a king whose impotent son begets an heir by arcane devices. In fact it is unlikely that the Christian emperors would have looked on alchemy with any more favour than did their pagan predecessor Diocletian, who attempted to burn the manuals of the art in the time of Zosimus. Most of the Byzantine writings on the subject are contained in a single collection of the 9th or early 10th century and dedicated to a certain Theodore. It includes poems under the names of Hierotheos, Heliodoros, and Archelaos, but the most important item is Stephen of Byzantium's treatise *On the Making of Gold*. Like the later volume of the same name by the polymath Michael Psellos, this treats the extraction of precious metals as its principal enterprise. It was another scholar, Gemistos Plethon, who drew the attention of the Western humanists to the *Hermetica*; but he, like Psellos, was chiefly a compiler of other men's doctrines, and the great tradition of alchemy was indebted to Byzantine authors more for what they copied than what they wrote.

Alcibiades 451/50–404/03 BC

Athenian general and politician

Born into a wealthy family, Alcibiades became the ward of Pericles and his brother Ariphron after his father Cleinias was killed at the battle of Coronea in 447 BC. Although he had fought at Potidaea in 432 BC, where he was wounded and his life saved by Socrates, his first datable political activity was in 420 BC in the immediate aftermath of the Peace of Nicias, which had ended the first phase of the Peloponnesian War (Thucydides, 5. 43). While Nicias advocated that diplomatic pressure should be exerted on the Spartans to persuade their allies to conform to the treaty by carrying out agreed concessions to the Athenians, Alcibiades sought to exploit the

Spartans' difficulties with their allies, even at the expense of the peace. He won the argument and an alliance was made with the Argives and two of Sparta's renegade allies, Mantinea and Elis, but he was unable to obtain sufficient votes to secure the necessary resources to support his policy: only 1300 Athenian troops fought at the battle of Mantinea in 418 BC, when victory enabled the Spartans to recover their lost allies and restore their domination of the Peloponnese.

Thucydides comments on Alcibiades' youth in 420 BC; he reports that Nicias referred to him as "a young man in a hurry" in the debate on whether to send an expedition to Sicily in the spring of 415 BC (Thucydides, 6. 12). Alcibiades was handsome and eloquent, and his charisma had been enhanced by his success in the Olympic festival of 416 BC, when three of his seven entries in the chariot race were placed first, second, and fourth. His advocacy of the Sicilian expedition clearly contributed to the atmosphere of great enthusiasm and high expectations; Thucydides reports that in the end those opposed to the scheme did not dare to vote against it (6. 24). Nevertheless, his flamboyance and palpable personal ambition created mistrust, helped by the deviousness he had shown in an ostracism campaign, probably in 416 BC, when he had agreed with Nicias that they should protect one another by directing their supporters to vote against Hyperbolus (who was then ostracized) and then by a highly unusual proposal to appoint Alcibiades sole commander of the expedition (which was rejected in favour of his sharing responsibility with Nicias and Lamachus); and in the public hysteria that followed the sacrilegious mutilation of the many busts of Hermes on the streets of Athens, his enemies were able to link him with rumours of revolutionary plots to establish oligarchy or tyranny.

When the expedition reached Sicily and Nicias favoured a concentration on limited objectives, Alcibiades failed to support Lamachus' proposal of a direct attack on Syracuse, the chief threat to Athenian interests, which might well have succeeded. Instead he forced Lamachus to back his own plan first to secure more allies, despite their having failed to receive the expected help from Thurii, Rhegium, and Segesta. Alcibiades' policy was adopted with limited success, Naxos and Catane being won over, but Messana and Camarina refusing. At this point he was recalled to stand trial, but, knowing that his enemies at home had been poisoning minds against him since his departure, he eluded his escort at Thurii and fled to the Peloponnese, the Athenians sentencing him to death in his absence.

It is debatable how far Alcibiades' recall affected the Athenian forces, because Nicias now supported Lamachus' plan; after twice defeating the Syracusans outside their city, in the early summer of 414 BC he was completing a series of blockade walls around the town and had high hopes of its surrender. Alcibiades, however, had gone to Sparta and urged the Spartans to send help to Syracuse, emphasizing the extent of Athenian ambitions and their threat to the Peloponnese, and suggesting that the Spartans should at least send a competent general to organize its defence (Thucydides, 6. 91). The Spartans were persuaded and sent Gylippus, whose leadership of the Syracusans was a major factor in the disastrous defeat of the Athenians in 413 BC.

In 412 BC Alcibiades was influential in persuading the Spartans to send ships to the eastern Aegean in order to foment revolts among Athens' allies; he himself helped to win over Chios and Miletus. Meanwhile, king Agis, whose wife he had seduced, persuaded the Spartans that he was unreliable and should be eliminated, but he took refuge with Tissaphernes, satrap of the Anatolian coastal provinces, whom he sought to turn against the Spartans, also hoping thereby to facilitate his own recall to Athens. He then tried to promote a sympathetic regime there by promising that the removal of democracy would secure Persian help; and, although negotiations between Tissaphernes and the Athenian envoys failed and the Persians made a treaty with Sparta, the move against democracy, which had started, succeeded, and a short-lived oligarchy was set up in summer 411 BC.

Ironically, Alcibiades' exile was now cancelled by the commanders of the Athenian fleet at Samos, who refused to accept the oligarchy's authority. On joining them he played important roles first in preventing them abandoning their position in the eastern Aegean to attack Athens, and then in victories over the Spartans in the Hellespont (autumn 411 BC) and off Cyzicus (spring 410 BC). This must have been the period in Thucydides' mind when he said that "his conduct of the war was excellent" (6. 15), and he went on to recover Byzantium in 408 BC.

At this point (407 BC) Alcibiades thought that it was safe to return to Athens. There he received a warm welcome, his exile was officially rescinded, and he enhanced his popularity by organizing the annual procession to the festival at Eleusis to go by land for the first time since the Spartan occupation of Decelea in north Attica in 413 BC. There was still, however, according to Xenophon (*Hellenica*, 1. 4. 17), underlying mistrust of his ambitions and, when he briefly left the fleet in charge of his helmsman Antiochus, who was rashly provoked by Lysander and lost 22 ships, he was relieved of his command and prudently retired into exile. About a year and a half later Aristophanes in his *Frogs* had Dionysus say about him that the city "longs for and hates him and wishes to have him" (line 1425). But he was still in exile near the Hellespont in the late summer of 405 BC, when his warning to the Athenian generals of their folly in beaching their fleet at Aegospotami was disregarded and a surprise Spartan attack took all but eight ships almost without a fight and effectively won the war. After Athens' surrender in 404 BC Alcibiades crossed to Asia, where he was soon killed, probably on the orders of Pharnabazus, satrap of Phrygia, at Lysander's request.

Tradition held that Alcibiades was both the object of Socrates' passion and his pupil, and this association, it seems, was much in the mind of Socrates' accusers when they charged him with corrupting the city's youth. Plato had him figuring prominently with Socrates in his *Symposium* and *Alcibiades I* (*Alcibiades II* is almost certainly not Platonic). Paired by Plutarch in his *Parallel Lives* with the Roman Coriolanus, he was taken up, like Coriolanus, by Shakespeare, who used him in his historically inaccurate *Timon of Athens*. He has continued to fascinate the modern world, notably as the central character of Peter Green's novel *Achilles His Armour* (1955).

Biography

Born in Athens in 451 or 450 BC, Alcibiades was brought up by his guardian Pericles and was a pupil of Socrates. As a politician he was flamboyant but inconsistent, supporting first Athens, as one of the leaders of the disastrous Sicilian expedition, then Sparta. Losing the confidence of both, he fled to Persia but was subsequently recalled to direct operations of the Athenian fleet. Exiled again, he crossed to Asia after the defeat of Athens in the Peloponnesian War and was murdered in Phrygia in 404/03 BC.

Alexander III the Great 356–323 BC

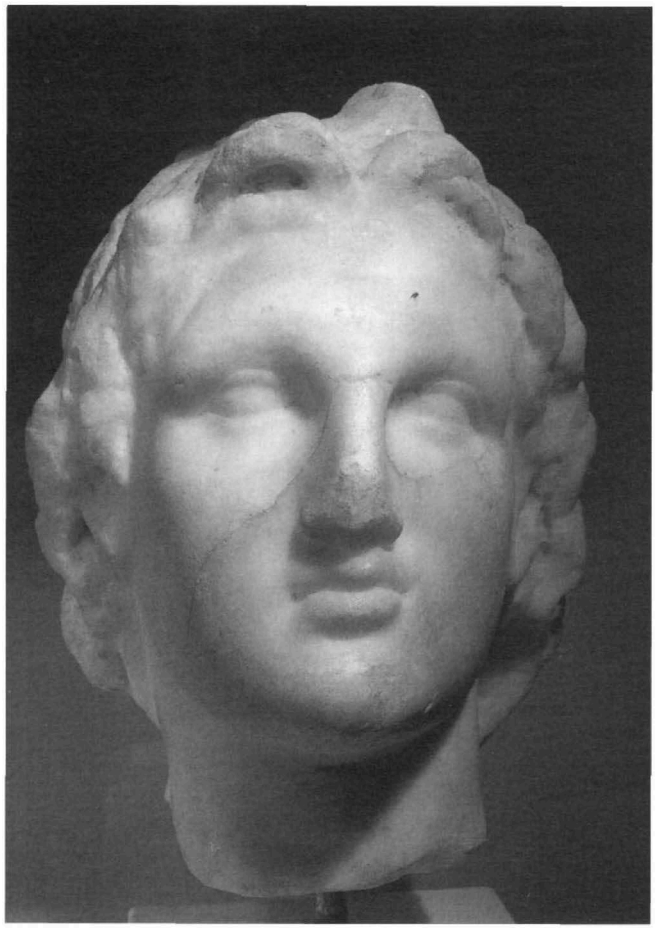
King of Macedon

After the assassination of his father king Philip II of Macedon, at Aegae (modern Vergina) in 336 BC, the 20-year-old prince Alexander acceded to the throne as Alexander III. The vast kingdom of Macedonia that he inherited extended eastward at this time to Thrace and the Black Sea, south to Thessaly, west into modern Albania, and north into the former Yugoslav republics and parts of Bulgaria. As a kingdom, it was politically distinct from the city states of the Greek mainland, although there had been contact between Macedon and Greece for hundreds of years. To give a few examples: an ancestor of Alexander III of the 5th century BC, king Alexander I, was known as "the philhellene" because of his alleged secret help to the Greeks during the Persian Wars, and Greek cities founded along the east coast of Macedonia and in Chalcidice certainly had been in contact with the Macedonians for centuries. Most importantly, recent archaeological investigations in Macedonia have shown beyond doubt that there were close links between aristocratic Macedonian society and the culture of mainland Greece: Attic pottery was imported to Macedonia by the end of the 6th century BC (found in cist graves at Sindos); the city of Pella (developed as the new capital at the end of the 5th century BC) has revealed the best extant pebble mosaics, impressive small finds from the agora, and the recently excavated royal palace, besides being the place where the great Athenian tragedian Euripides ended his life in exile; and the spectacular gold and silver vessels, armour, and jewellery from the 4th-century BC royal tombs at Vergina prove beyond doubt that the Macedonian court class was a rich, cultivated, and sophisticated society completely familiar with the culture of Greece. None the less, there was a deep-seated ethnic rivalry between Macedonian and Greek that the troubled political situation of the 4th century BC intensified. Throughout his life Alexander appears to have regarded the Greeks with suspicion, and never trusted them in political terms.

Alexander's father Philip II had become the political leader of mainland Greece after his defeat of the Greek forces at the battle of Chaeronea in Boeotia in 338 BC. He controlled the city states by enrolling them in an unequal alliance with him known as the League of Corinth (where the first meeting was held), and enlisted his Greek "allies" in a war of revenge against the Persian empire, ostensibly to free the Greek cities of Asia Minor from Persian rule, but in all probability to extend Macedonian control into Asia Minor. The young Alexander inherited control both of the League of Corinth and of the war to win the "freedom of the Greeks of Asia". It is on this basis that he undertook his famous expedition to the east, which has immortalized him as one of the greatest conquerors of all time, worthy of the epithet "the Great". Alexander's military campaigns, his defeat of the Great King of Persia and assumption of that title and position, his further expedition to the Indus river system in the Punjab, his return to the west after a troop mutiny, and his untimely death at Babylon in June 323 BC are all well known and described in an ever-expanding bibliography. His extraordinary military exploits and invincibility inspired later generals (Pompey, Caesar, Augustus, Trajan, and even Napoleon) to emulate him, and his early death at the pinnacle of his fame ensured his elevation to heroic legendary status and his position as a quintessentially romantic, fascinating historical figure.

Alexander the Great's contribution to the Hellenic tradition must be assessed in various ways. Merely to assert that he was the greatest and most famous figure in Greek history whose allure has lasted to modern times is not enough; although this claim alone may justify Alexander's place in posterity, it is a simplistic view based on our admiration for his achievements and fascination with such an enigmatic man. Various issues emerge from the study of Alexander, however, that are relevant to our appreciation of him in the context of Hellenic tradition. These embrace fields as diverse as art history, political developments, religion, and literature.

During his lifetime Alexander was responsible for an innovation that had important consequences for the history of Greek art. Up to the end of the 4th century BC the medium of portraiture was confined to "generic" portraits (a suitable type depicting a noble statesman, a general, etc.) and "imaginary" portraits (e.g. a hypothetical depiction of Homer; if a poet called Homer had indeed existed in the 8th century BC, certainly no one hundreds of years later could have known



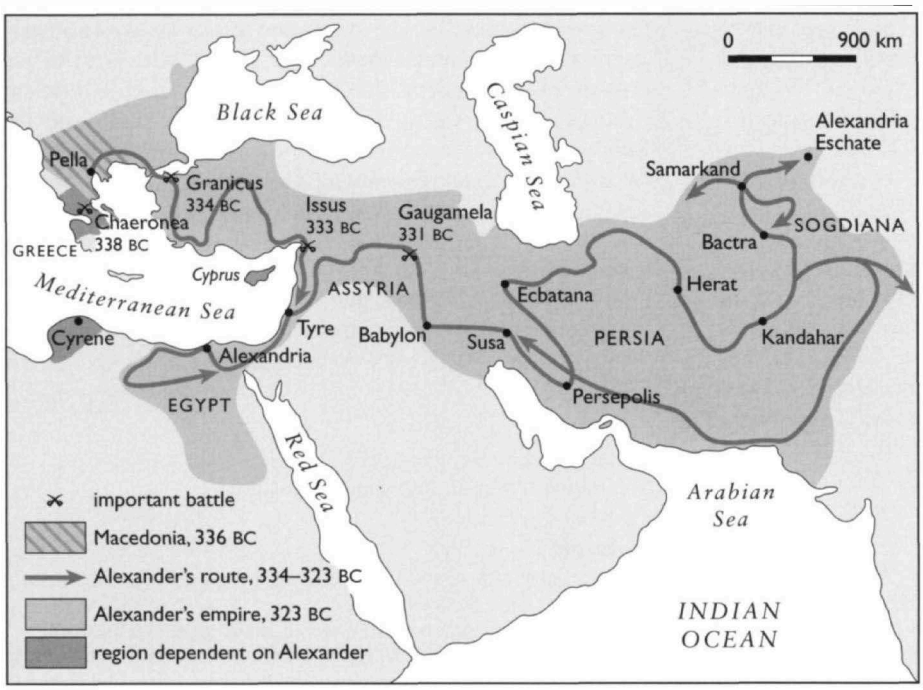
Alexander: portrait bust in marble, sculptor unknown, Graeco-Roman Museum, Alexandria

what he looked like) (see G.M.A. Richter [rev. by R.R.R. Smith], *The Portraits of the Greeks*, Oxford: Phaidon, 1984). Although the beginnings of individualistic portraiture may be traced to Persian kings and satraps of the 4th century BC, Alexander seems to have been the first ruler in the Greek world to control the production of his own image. The ancient sources tell us that he had a court sculptor, a court painter, and a court gem engraver whom alone he trusted to depict him in the approved manner. The surviving portraits of Alexander show that he was represented in a highly idealized way that was immediately identifiable (see J.J. Pollitt, *Art in the Hellenistic Age*, Cambridge: Cambridge University Press, 1986, pp.19–25). It could be argued that it was desirable for the peoples of his vast empire to have a recognizable depiction of their king, but such a conscious manipulation of one's image was quite new in Greek art, whether it stemmed from deliberate calculation on Alexander's part or merely excessive vanity. The canonical image of Alexander was taken over by his successors for propaganda purposes (see below), and the art of portraiture developed in the Hellenistic age into a major artistic genre, because the kings of the new Greek empires immediately appreciated the ways in which images of themselves could prove beneficial (see R.R.R. Smith, *Hellenistic Royal Portraits*, Oxford: Clarendon Press, 1988).

The personal empire that Alexander created in Asia was not the same as the Macedonian state. At the age of 20 the king had left his homeland under the control of the regent Antipater, with whom he had only sporadic contact for the next 11 years, and he died unexpectedly – never having returned home or secured the Macedonian succession with an heir – with only interim administrative arrangements in place for the vast eastern territories he had conquered. By the end, Alexander's entourage consisted not of an inner circle of nobles who had traditionally advised the king according to Macedonian custom, but of a group of self-made, ambitious generals whose position depended on their personal loyalty to Alexander himself. These men (the so-called "successors") were suddenly left leaderless in Babylon, and some 20 years of chaos ensued before the emergence of three relatively stable new empires, which form the focus of the "Hellenistic" history of the next three centuries.

It soon became clear that Alexander's empire could not survive intact under a single successor. Alexander's posthumous infant son Alexander and his half-witted half-brother Philip Arrhidaeus were declared joint kings, Alexander IV and Philip III. Their regent Antipater, who had been a general under Philip II, firmly resolved to take the kings home to Macedonia, thereby returning Macedon to its origins as a Balkan kingdom. This might have allowed the royal Argead dynasty of Macedonian kings (the family to which both Philip II and Alexander the Great belonged) to continue to rule in an unbroken bloodline in their European homeland, but both kings were soon murdered in the power struggles among the successors, as were, eventually, all the immediate members of Alexander the Great's family. This signalled the extinction of the Argead line of Macedonian kings. Paradoxically, the political and personal influence of Alexander, the absent king, in his Macedonian homeland was far less important than that of his father Philip II had been, and it pales into insignificance when compared to his posthumous reputation and influence in the Asia he had opened up to the Greeks.

Since the sole uniting feature of Alexander's empire had been the king himself, various successors, who were eager to establish their own power in areas of Asia, sought to cloak themselves with the aura of Alexander's legacy in an effort to gain political legitimacy. Although none actually claimed to be Alexander's sole successor, attempts at "identification" with the late king proved a forceful propaganda tool in establishing the validity of their respective political power. Much of this imitation was achieved by the manipulation of royal iconography and the use of Alexander's image. For example, although Alexander himself never minted coins with his own portrait on them, shortly after his death some successors issued coinage with a highly idealized, almost divinized, head of Alexander adorned with subtly emotive attributes: the horns of Zeus Ammon (the oracular god whose shrine in the Egyptian desert Alexander had visited and with whom he felt a particular affinity for the rest of his life), the elephant-scalp headdress (which refers to his victories in India where he faced elephants in battle), and the royal diadem. These early portrait coins of Alexander clearly illustrate the potency of his image, but also directly influence the coinage of all his royal Hellenistic successors, which contains the bead of the particular ruler and a selection of themes with propaganda value pertinent to the royal house in question (see Norman Davis and Colin M.



3. The empire of Alexander the Great in 323 BC

Kraay, *The Hellenistic Kingdoms: Portrait Coins and History*, London: Thames and Hudson, 1973, plates 1–9) .

The strength of Alexander's posthumous reputation as a tool of royal propaganda is seen most clearly in the kingdom of Ptolemaic Egypt (ruled by Alexander's former Macedonian general Ptolemy who subsequently declared himself king and founded a dynasty that ruled Egypt until the suicide of Cleopatra VII in 31 BC). Ptolemy hijacked the funeral cortège of Alexander while it was en route from Babylon, and brought his body to Egypt, eventually burying it in a magnificent tomb in his capital, Alexandria. By this devious act, Ptolemy became the guardian of the body of Alexander, which elevated his importance even as it linked him inextricably with the late king. The remains of Alexander and his magic belonged to Ptolemy. The tomb became the focus for the worship of Alexander (in Alexandria he was worshipped as the "founder God") and, later, of the royal cult of the Ptolemies themselves (see below). The continuing importance of the tie of the Ptolemaic royal family with Alexander was graphically illustrated in a procession staged in Alexandria by Ptolemy I's son and heir, Ptolemy II Philadelphus. A major part of this procession honoured the Greek god Dionysus (from whom the Ptolemies claimed descent), and one important pageant depicted Dionysus as the returning conqueror of India. The parallel between the Indian victories of Dionysus and Alexander (who also features in the procession) was made explicit in the context of the procession, and the Ptolemies shared in the splendour of the eastern triumph as the heirs of Alexander and Dionysus (see E.E. Rice, *The Grand Procession of Ptolemy Philadelphus*, Oxford: Oxford University Press, 1983, pp.84–86). In Egypt Alexander's image and posthumous reputation were deliberately used as powerful symbols of invincibility, divine connections, and the legitimate transfer of political power to the Ptolemaic royal house.

Alexander's views about his own divinity remain unclear because there is little evidence as to what he himself thought about it. He was not the first mortal to receive honours of a superhuman nature, but it appears that he was voted certain divine honours and welcomed them, even if he did not actually demand them. However this may be, the worship of Alexander was widespread in many parts of Greece and Asia after his death, as various cults, priests, dedications, etc., attested. This worship of Alexander clearly influenced the development of the ruler cults of the various Hellenistic monarchies, the deification of monarchs during their lifetime, and the civic cults established by Greek cities in honour of various kings, once the boundary between gods and men, and the honours appropriate to each, had become blurred. When the Romans came to dominate the Greek east, the establishment of the imperial Roman cult in this area can be seen as a natural progression of the acceptance of the worship of a human being (see S.R.F. Price, *Rituals and Power: The Roman Imperial Cult in Asia Minor*, Cambridge: Cambridge University Press, 1984).

A far more difficult issue is the question of Alexander's role in the Hellenization of the east. How far was Alexander himself responsible for the fact that, over the following several centuries, vast areas of Asia (comprising the Middle East, modern Turkey, Iran, Iraq, and parts of Afghanistan and Pakistan as far as India) became urbanized, populated by Greeks living in harmony with native peoples and remaining largely Greek-speaking, even after many of these territories were incorporated into the Roman empire? Alexander is often regarded as one of the greatest city-founders of all times. His cities were mostly named "Alexandreia" (the transliterated form of the name in Greek), and stretched from Alexandria in Egypt at the southwest tip of his empire to Alexandria Eschate ("the Furthest") on the Jaxartes river (modern Syr Darya) in Central Asia in the extreme northeast of it. It has often been claimed that these Alexander-foundations were responsible for spreading the light of Greek civilization throughout barbarian Asia, but the truth is impossible to ascertain. The ancient sources differ widely about the number (from very few to very many) and locations of his city foundations, as well as their nature. Some, we are told, were cities in the proper sense: permanent settlements with civic institutions and buildings in the Greek style. Others appear to have been fortified military settlements sited at strategic geographical points, and yet others outlying guard posts established as needed to control the surrounding area. There is no evidence for Alexander's reasons for founding cities – if indeed he had a well-thought-out policy in so doing beyond a general preference for civic life – although the rationale behind those that had a military or strategic importance seems obvious enough. In the few cases where we are told of its composition, the population was a

mixture of time-expired Macedonian veterans, Greek mercenaries, and local inhabitants who volunteered to settle there. It is no coincidence that very few Alexandrias known from literary sources have been identified on the ground. In the first place, the pattern of life in Central Asia was essentially nomadic, not accustomed to urbanization. Furthermore, the artificially gathered population was an unhappy mix of peoples (many of them thousands of miles from home and probably longing to return) who had no natural affinity with each other. Many Alexandrias probably soon died out from lack of interest, starvation, internal warfare due to ethnic tensions, or migratory invasions from outside, leaving no identifiable archaeological remains. Other Alexandrias may have been refounded and renamed by Alexander's successors, leaving no clue as to their original foundation.

Given the above considerations, the conclusion must be that Alexander's ephemeral cities themselves can have hardly caused the east to be Hellenized as it was to become in the Seleucid and Graeco-Roman period. The sense in which Alexander can indeed be said to be ultimately responsible for the spread of Hellenic culture in this region is that it was he who opened up the east geographically to the west and created the possibility of Graeco-Macedonian domination there, even though he did not live long enough himself to see it permanently pacified and administered by a ruling class of his creation. The eventual results of Alexander's actions, therefore, must not be confused with his irrecoverable intentions at the time, since it was left to his successors to carry out their own schemes of urbanization and Hellenization.

Finally, Alexander's achievements and extraordinary fame contributed in an unexpected way to the development of ancient Greek literature and, through it, to the development of medieval and modern literature. Many histories of Alexander were written in antiquity, from contemporary eyewitness accounts of the campaigns to works by writers who lived hundreds of years later. The former survive only by title or in quotation by the latter, who drew upon these first-hand accounts as well as on a large body of popular tales that quickly grew up about a figure as world-famous as the great Macedonian conqueror. None the less, these serious histories of Alexander – however important they undoubtedly are to our understanding of Greek historiography – share the stage with a work of a type that has more in common with the ancient novel, namely the romance, a genre of Greek literature that was increasingly popular in the Hellenistic and Graeco-Roman periods.

The so-called *Alexander Romance* is a fascinating "pseudo-historical" source for Alexander the Great. It is a fictitious account of Alexander's exploits based loosely on the historical record, combining several different sources into the main Greek version which has come down to us (it was falsely assigned to Alexander's official historian Callisthenes – hence its frequent attribution in modern literature to pseudo-Callisthenes). Scholars have argued that the *Alexander Romance* dates in its present form from the 3rd century AD (although it incorporates older elements), and that various identifiable strands in it include a fictitious biography of Alexander, an epistolary novel of Alexander's supposed letters, and set-piece descriptions of marvels (see Tomas Hägg, *The Novel in Antiquity*, Oxford: Blackwell, 1983, pp.125ff.). However this may be, the *Alexander Romance* was a hugely popular and influential work, and the vehicle by which a version of Alexander's deeds passed into several different cultures. There was a Byzantine metrical version of the *Romance*, and it was translated in the Middle Ages into some 35 different languages, among them Latin, Syriac, Arabic, Armenian, Hebrew, Ethiopic, and Hungarian. The Alexander of the *Romance* and his amazing exploits became one of the most popular heroes in the medieval Ottoman Karagöz shadow-puppet theatre, and can still be seen today in its modern Greek equivalent, the Karaghiozis puppet theatre.

Biography

Born in 356 BC, the son of Philip II and Olympias, Alexander was a pupil of Aristotle. He fought at Chaeronea in 338 and succeeded to the throne of Macedon on his father's death in 336. Having established himself a master of the Greek world, he crossed the Hellespont in 334 with a huge army to conquer the Persian empire. He died on his return, at Babylon in 323 BC. His military exploits and early death ensured his immortality in the Hellenic tradition.

Alexandria

City in Egypt

At the time of Alexander the Great's invasion of Asia, Egypt had been, intermittently, a remote part of the Persian empire since 526/25 BC when the Great King Cambyses invaded and conquered the country. Persian rule appears to have been harsh during the 4th century, with the result that Alexander was welcomed by the Egyptian populace to whom another foreign conqueror was welcome if it meant the end of hated Persian rule. Alexander entered Egypt from Gaza, and paid his respects at the inland dynastic capital Memphis (south of Cairo) before sailing north along the Nile via the western branch of its delta to the Mediterranean coast, to a small native town called Rhakotis.

There, in 331 BC, Alexander made the first, and indisputably the greatest, of his city foundations, and named it "Alexandreia" (in Greek) after himself. The ancient literary sources give us a romantic picture of the young Alexander appreciating the suitability of the site and taking a personal interest in the design of the city, pacing out the line of the city walls and marking the location for various structures inside. However this may be, the coastal site of Alexandria was a magnificent choice for a city, facing on to the Mediterranean, endowed with good natural harbours, and with easy access to the interior of Egypt through the river system. It may be that local Greek traders in the region (Greeks had been settled at the inland delta city of Naucratis since the 7th century BC) persuaded Alexander of the site's potential, or perhaps Alexander – with a view to his posterity – just acted upon a suggestion that was attractively presented to him. The actual design of the new city was left to Deinocrates, a Macedonian town planner/architect in Alexander's entourage.

Alexander left Egypt and continued his expedition to the east, leaving Alexandria under the control of an appointed financial administrator, Cleomenes of Naucratis. Alexandria seems to have functioned as a Greek polis from shortly after its foundation. When Alexander died in 323 BC, the territory which he had conquered was divided up among his successors for the purposes of administration. The satrapy of Egypt was assigned to Ptolemy son of Lagus, a Macedonian boyhood friend of Alexander who served as a general during the eastern expedition, and it remained firmly in his hands throughout all the struggles of the successors. Cleomenes had proved to be notoriously corrupt in his dealings with the grain trade. After Ptolemy arrived in Alexandria, he made Cleomenes subordinate to him and eventually had him killed. When, in line with the other successors, Ptolemy declared himself a "king" in 305/04 BC, Alexandria became the capital city of his new kingdom, and it remained the capital of the Ptolemaic empire throughout the course of its existence.

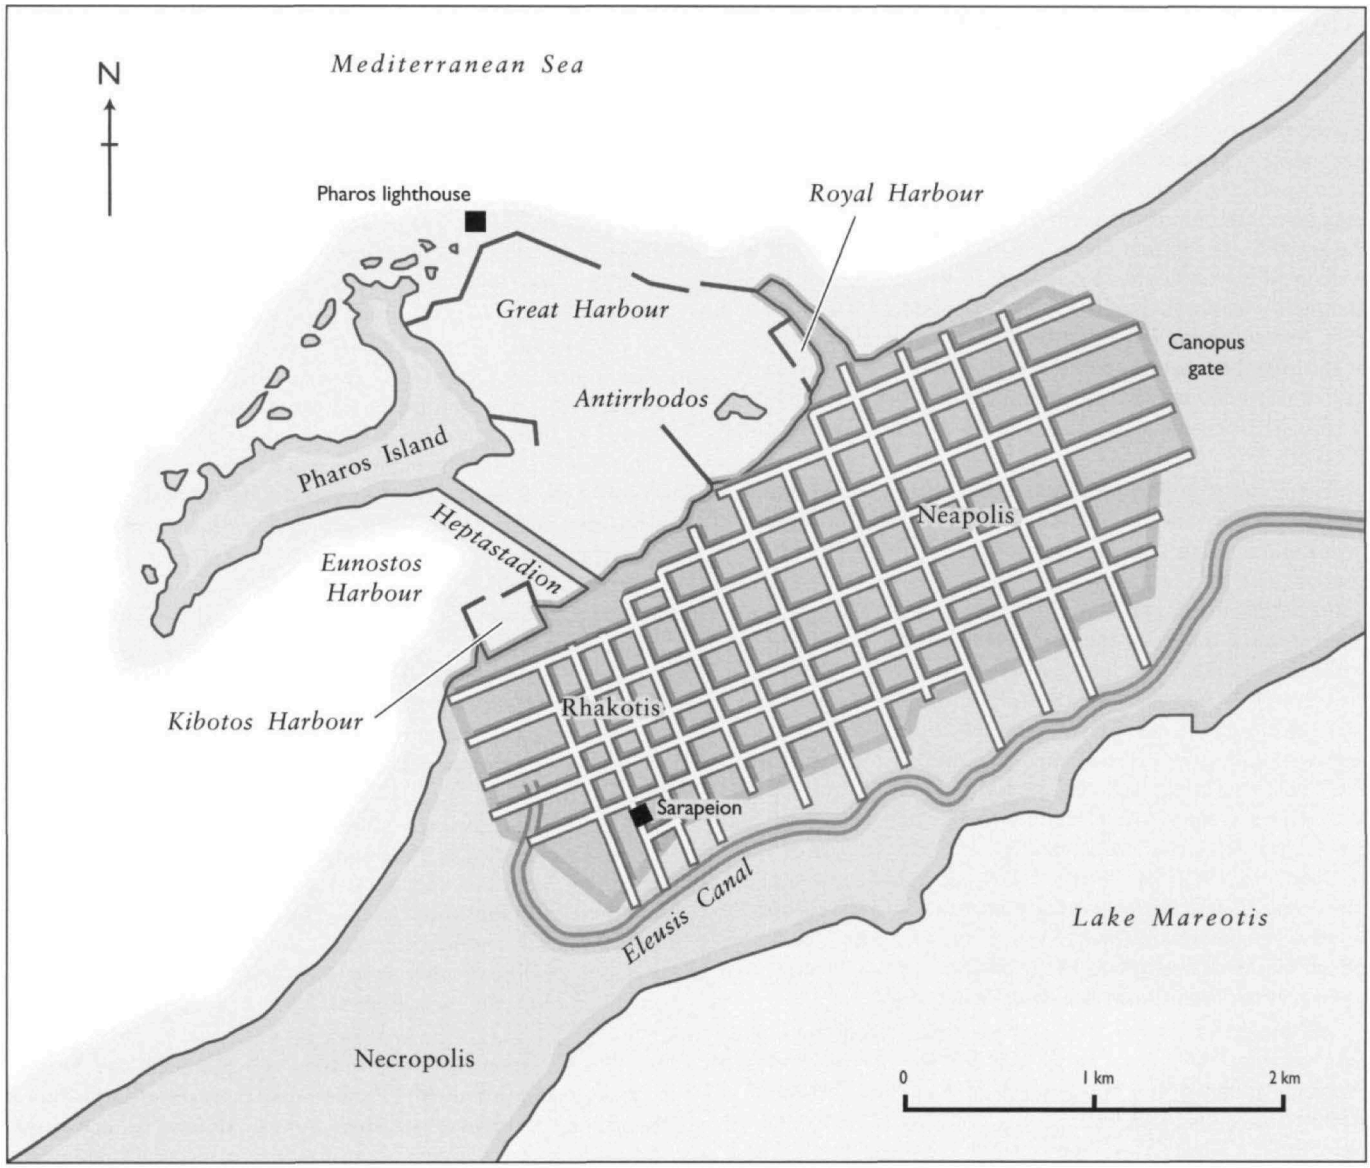
During the reigns of Ptolemy I and his son Ptolemy II Philadelphus, Alexandria developed into a great city which became the jewel of the Mediterranean, taking over from Athens as the commercial and cultural capital of the Greek world. Immigrants were recruited from all over the Greek world to settle in the new city, and soon there evolved a mixed population of Greeks, native Egyptians, Jews, and other ethnic groups. To the first Ptolemies must be attributed the developed layout of the city (based on a grid plan around two main intersecting thoroughfares running the length of the ancient city) and the construction of its most famous features. (The best ancient description of the city is found in book 17 of the geographer Strabo, who visited Alexandria in 24 BC.) Knowledge of ancient Alexandria is limited both because the ancient city has been continuously inhabited and built over, and because the shoreline has sunk several metres since antiquity, submerging large areas of the original city.

The great Pharos, or Lighthouse, of Alexandria was constructed in the eastern harbour, perhaps on the site of an earlier beacon, on the small offshore island of Pharos (whence the lighthouse takes its name) which in antiquity was connected to the mainland by a causeway. The site is occupied today by the 15th-century fort of the Sultan Qait Bey. The Pharos is described by many ancient authors and is depicted on coins of the Roman period. It was the latest construction to be reckoned as one of the seven wonders of the ancient world. An inscription attests the involvement of Sostratus of Cnidus, but whether as architect or dedicator is unknown. Recent underwater excavations near the fort have revealed major remains from the structure.

The main royal complex of the Ptolemies was a huge area known as "the palaces", comprising several major buildings. Its location was thought to be in the area of the Lochias promontory, approximately the site of the smaller modern headland Silsileh on the eastern side of the east harbour, and this has been confirmed by exciting new underwater excavations west of Silsileh. Finds apparently from the palaces have been recovered but they are still being studied. The royal residences of the Ptolemies would undoubtedly have been grand and luxurious, reflecting their acclaimed wealth, but the palaces contained other structures which housed institutions credited with the preservation and dissemination of Greek culture.

The Museum (in Greek *Mouseion* – Shrine of the Muses) was founded probably by Ptolemy I as a complex of residential blocks and study facilities for scholars. Attached to it was the famous Library of Alexandria, founded originally in imitation of the library in Athens but soon eclipsing it in size and fame (ancient sources mention some 490,000 papyrus rolls). The librarian was appointed directly by the king and held the post for life. The library was responsible for the codification, copying, and therefore preservation of much of Greek literature, and attached to the museum and library were some of the greatest Greek scholars and writers of their day from all over the Greek world, many specially invited to Alexandria by the king: the 3rd-century BC poets Callimachus, Theocritus, Lycophron, and Apollonius Rhodius, the mathematician Euclid, the astronomer and geographer Eratosthenes of Cyrene, the grammarian Aristophanes of Byzantium, the 2nd-century AD geographer Claudius Ptolemy, to name but a few. It was an irreparable loss that the library was accidentally burnt in 48 BC during Julius Caesar's "Alexandrian War". A second large library was attached to the temple of Sarapis (or "Sarapeum") in the southern part of ancient Alexandria.

The Greek translation of the Hebrew Old Testament, the so-called Septuagint, was made at Alexandria. Tradition maintains that King Ptolemy II summoned the greatest Jewish scholars of the day to his city, and entertained them while the



4. Alexandria

translation was made. It may rather have been at the behest of the Hellenized Jewish community whose knowledge of Hebrew was decreasing to the point that they could no longer read their holy books in their original language.

Alexandria's fame was furthermore ensured by the burial there of Alexander the Great. His funeral cortege from Babylon was diverted by Ptolemy I to Egypt, and his body first buried in the dynastic capital Memphis before being transferred to a grand tomb (in Greek the "Sema" or "Soma") in or near the palaces area in Alexandria. The various chronological stages of construction for this tomb are uncertain due to varying literary tradition, but, in time, the Ptolemies themselves were buried there and the Sema became the focus of the cult of Alexander and the ruler cult of the Ptolemies. The original gold sarcophagus is said to have been replaced later by an alabaster one, and it is attested that the 3rd-century AD Roman emperor Caracalla gazed upon the embalmed Alexander.

Throughout the centuries of Ptolemaic rule in Egypt, Alexandria remained their capital, and, so far as we can tell, primarily a Greek city, although Egyptian architectural and decorative elements can be seen, especially in the extensive necropolis areas with their rock-cut chamber tombs designed for multiple burials. In common with the other Hellenistic kingdoms, Alexandria came to the attention of Rome, and by the 1st century BC became involved in the Roman civil wars. It is well known that the last Ptolemaic queen, Cleopatra, had a liaison with Julius Caesar, and a renowned love affair with Mark Antony. Their naval defeat at Actium at the hands of Octavian (later the emperor Augustus) led to the suicides of both Antony and Cleopatra.

After the death of Queen Cleopatra VII in 31 BC the Ptolemaic dynasty came to an end and Egypt became a province of the Roman empire. Alexandria continued to flourish due to its advantageous location for east–west trade, and became the second largest city of the empire. For the first three centuries AD massive freighters carrying the Egyptian grain which fed the population of Rome set out on their journeys

from Alexandria every spring. Alexandria continued as a centre of learning. It was the home of the Neoplatonist school of philosophy, whose most influential member was the 3rd-century AD scholar Plotinus, who studied in Alexandria for a time. The school remained active until the 6th century AD, and influenced later Byzantine Greek thought, among much else. A great corpus of commentaries on the famous 4th-century BC Greek philosopher Aristotle was produced by the Alexandrian school.

This pagan tradition existed alongside Christianity, which came early to Alexandria. The evangelist St Mark is reputed to have come to Alexandria in the 1st century AD, to have been its first bishop, and to have been martyred there. Alexandria became one of the main centres of the Christian Church in the first centuries of its existence. A group of influential Greek Christian writers lived and worked in Alexandria in the 2nd and 3rd centuries AD, among them St Clement of Alexandria and Origen. In the 4th century AD Alexandria became the focus for the Arian heresy (named after its promulgator Arius), which was condemned by Athanasius, soon to become the bishop of Alexandria and a champion of orthodox Christianity, at the Council of Nicaea in AD 325. The learned pagan scholar Hypatia, a teacher of Neoplatonic philosophy, was murdered by a Christian mob in Alexandria in 415. The 5th-century bishop Cyril of Alexandria vigorously refuted the pagan writings of Julian the Apostate. Alexandria, a city gleaming with marble according to an Arab source, fell to the Arabs in 642, thereby ending its existence as a Greek city, although Greeks continued to live there.

In the 19th century the renewed maritime prowess of Alexandria made it the second city of Egypt (after Cairo). The city attracted thousands of immigrant merchants and craftsmen from all over Europe and the Mediterranean who founded foreign enclaves; among these was a large Greek population, many of whose descendants remained in Alexandria for generations. This exotic, levantine, cosmopolitan city is memorably evoked in the pages of Lawrence Durrell's four novels which form *The Alexandria Quartet*. Probably the most famous Greek resident of Alexandria in the late 19th and early 20th centuries was the poet Constantine Cavafy (1863–1933), who spent most of his life in the city.

Summary

City in Egypt founded by Alexander the Great in 331 BC. After Alexander's death in 323 Egypt became the kingdom of Ptolemy. Alexandria remained the capital of Ptolemaic Egypt until the fall of the dynasty in 31 BC. It succeeded Athens as the centre of Greek culture and was famous for its lighthouse, palaces, museum, and library. Later it was an important Christian centre. It fell to the Arabs in 642.

Alexios I Komnenos *c.*1057–1118

Emperor

Alexios I Komnenos (1081–1118), the third son of John Komnenos and Anna Dalassene, was born around 1057, the same year that his uncle, Isaac I Komnenos, ascended the imperial throne. He died on 15 August 1118. His life and reign were the subject of the *Alexiad*, a historical work that his daughter, Anna Komnene, completed a generation after his death. A contemporary, often highly critical account is contained in the *Epitomi Historion* of John Zonaras. The divergence between these two principal sources has been perpetuated in modern scholarship, where Alexios is considered either a paragon "who saved his empire from the rocks on which it seemed likely to founder before 1081" (Nicol, 1991), or as an arch-reactionary who ruthlessly crushed the enlightened "New Society" that had emerged in the mid-11th century (Lemerle, 1977). By all accounts it is clear that Alexios's early diplomatic and military successes set the seal on the triumph of provincial aristocratic values over those of civilian intellectuals and bureaucrats, and allowed his own extended family to dominate Byzantine political life throughout the 12th century. The triumph of kin is paramount: unlike any emperor of the 11th century, Alexios was succeeded by his son (John II), grandson (Manuel I), and great-grandson (Alexios II).

Alexios came to prominence as a ruthless and effective general. As Grand Domestic after 1078 he defeated the imperial pretenders Nikephoros Bryennios and Nikephoros Basilakes, thus securing Nikephoros III Botaneiates's tenuous

hold on power. This was ended by his own successful coup: Alexios's troops entered and looted Constantinople on 1 April 1081. Thereafter, he consolidated his position in the capital through ties of kinship. He entrusted general administration to his mother and elder brother Isaac, and forged an association with the Doukas family, marrying Irene Doukaina, and betrothing his infant daughter Anna to the *porphyrogennetos* ("born to the purple") Constantine Doukas (son of Michael VII Doukas). Alexios was thus free to remain in the field, where for the next decade he campaigned against both the Normans under Robert Guiscard, and the nomadic Pechenegs. To defeat the Normans he required the support of the Venetians, to whom he granted extraordinary trading privileges throughout the empire. The first phase of his reign ended with the crushing victory over the Pechenegs at Levunium on 29 April 1091, about which, Anna reports, it was sung thereafter: "All because of one day the Scythians never saw May." Consequently, Alexios was able to disinherit Constantine Doukas in favour of his own infant son John.

Alexios wished to recover imperial territory in Anatolia from the Seljuk Turks, and appealed to pope Urban II for fellow Christian warriors to aid in his *reconquista*. The response provoked by Urban's preaching, the First Crusade, was a shock and a challenge for Alexios, who succeeded to a large extent in turning the crusaders' energies to his advantage, recovering the western and southern littorals of Asia Minor. Nevertheless, the tensions between East and West that resulted from this grand encounter, and the establishment of the Latin crusader states free from Byzantine suzerainty, set the agenda for future Byzantine foreign policy. It is not surprising that Anna, writing after the Second Crusade (1147–48), suppressed her father's role as a catalyst for the first armed pilgrimage, and we must rely on references in a few Latin accounts, and the testimony of a 13th-century chronicler, the so-called Theodore Skoutariotes, for details of his actions before 1096.

An immediate consequence of soured relations between Alexios and certain Latins was the threat of a second crusade aimed at capturing Constantinople, which was promoted throughout Latin Christendom by the Norman, Bohemond of Taranto. Although this greater menace was averted by Alexios's diplomacy, a second phase of Byzantine–Norman wars in the western Balkans ensued. The treaty of Devol, which brought these to an end in 1108, sealed Alexios's last major foreign-policy success, but to a great extent revealed how hollow were his achievements in that sphere. The stipulation that the Normans must return Antioch to imperial control upon Bohemond's death could not be enforced, and consequently Alexios's successors were committed to long and arduous campaigns and diplomatic entanglements in the Holy Land. Moreover, Alexios failed to drive the Seljuk Turks from Anatolia, and his last campaign of 1116 reinforced this failure: he created a frontier zone around Bithynian Olympus, and evacuated as many of the native population of the interior as would follow him.

Alexios's domestic policy was not truly his own: "He had little interest in (or perhaps aptitude for) the running of government" (Angold, 1996), and entrusted such matters to a series of powerful individuals. First, as we have seen, were his mother and brother; later, after 1112, Alexios entrusted affairs to his wife, and not his son, which precipitated a succession crisis upon his death. Alexios's administrators presided over a major monetary reform around 1092. Gold coin, which had been debased dramatically, was restored in fineness, and fractional denominations were introduced in electrum, billon, and copper. This facilitated a reform in taxation practices, the *Nea Logarike*. After 1102 a new imperial officer, the Logothete of the Sekreta, seems to have had overall control of fiscal administration; the office was held only by the emperor's close relatives. A second significant innovation was the foundation of the Orphanotropheion, a charitable complex in Constantinople. Based around the church of St Paul, it was "like a city within a city" (Magdalino, 1996), which housed, fed, and treated the old and infirm, and educated the children of the poor and orphans. The Orphanotropheion served as a powerful symbol of Alexios's personal piety, a characteristic that he promoted as a counterweight to his persecution of certain individuals whom he tried and condemned as heretics. The most notorious trials were those of the intellectuals John Italos, Eustratios of Nicaea, and Basil the Bogomil.

Alexios's last years were plagued by illness, and one of the most powerful scenes in the *Alexiad* describes his death, surrounded by his kin. His father's death also moved John II, who had a series of panels commissioned that celebrated Alexios's exploits, but also featured his death. Clearly, Alexios's image was created and recreated after his death as a means to legitimate the competing imperial claims of his children. In this context we might better understand the *Mousai*, a work attributed to Alexios, and supposedly intended as advice to his son, which now appears more likely to be another posthumous creation. In the absence of further contemporary evidence Alexios will remain something of an enigma, and the historical appraisal of his life and achievements ambiguous.

Ali Pasha of Ioannina 1750–1822

Governor of Epirus

Ali Pasha of Ioannina was the Ottoman-appointed governor of Epirus in northern Greece during the critical decades leading up to the first outbreak of the Greek War of Independence in 1821. At the peak of his power, Ali or members of his immediate family controlled the whole of the Peloponnese and the Greek mainland, with the sole exception of the southernmost portions of Attica.

Thought to have been born in 1750 in the southern Albanian village of Tebelen, Ali was a member of a low-ranking noble Albanian Muslim family. By the time of his birth, however, all that remained of his family's nobility was its title – Ali's early biographers all report that his family was virtually destitute in the mid-18th century. It is this poverty that is often used to explain Ali's activities as a brigand and bandit, activities which paved the way for his rise through the Ottoman bureaucracy. Before the age of 20, Ali and his band of Albanian scipetars – the warriors who made up Albanian brigand groups – held de facto control over much of southern Albania and Epirus. The Ottoman state recognized Ali's domination of and familiarity with these territories and in 1778 attempted to coopt his power and influence by appointing him to his first position in the Ottoman hierarchy, that of *kahya* (deputy) to the *derbendler başbuğu*, or chief of police of the mountain defiles, a position which dated from Byzantine times and which had been adopted in turn by the Ottomans. In this new capacity Ali was able further to consolidate his power and simultaneously to please his Ottoman masters by eradicating all brigand activity for which he himself was not responsible. He did not, however, cease himself to be a brigand, but rather gave his brigand activity a pseudo-official quality, instituting regional tariffs, demanding tribute from the citizenry, and charging fees for safe passage through the rugged mountain passes of the region.

Thus it is that early on the Ottoman state established what was to be the pattern for its relationship with Ali throughout his life. Recognizing his formidable power and their own minimal ability to subvert it (Ali's territories were among the westernmost of the Ottoman empire, difficult for the distant Istanbul bureacracy to control), the Ottomans sought instead to make it appear that Ali's powers were the product of Ottoman choosing rather than of Ali's own doing. So it is that Ali was subsequently appointed to a series of increasingly prestigious Ottoman positions. In 1787 Ali himself became *derbendler baùbuXu* and was appointed *mutassarif* (chief administrator) of Ioannina that same year, becoming vizier in 1798.

As pasha of Ioannina – the date of his appointment as pasha (governor) is contested – Ali was in control of an overwhelmingly Greek population, and the policies he instituted within his pashalik exerted a strong influence over the social, economic, and intellectual conditions of Greece in the 18th and early 19th centuries.

In the 18th century Ioannina was established as Greece's premier city of learning, and housed a number of educational institutions. Many of these existed through the endowments of Ioannina's wealthy community of merchants, who in the 17th and 18th centuries had established far-flung trade networks throughout the Balkans, in the Black Sea area, and in the Italian city-states, particularly Venice. Such wealthy Ioanninite families as the Zosimades founded schools that added to the traditional, religiously based curriculum the western European emphasis on and interest in Hellenism, the pre-Byzantine past, and Classical philology. In addition to such "modernized" institutions, Ioannina also had long-established ecclesiastical centres of Greek education. While Ali did not directly promote these institutions, he unwittingly was influenced by them and in some ways furthered their aims. He was the first major ruler of the Balkans, for instance, to use demotic Greek as the language of his courtly affairs. This emphasis on the vernacular for official business helped lay the groundwork for the demoticist point of view in the early years of the modern Greek state, when intellectuals and reformers debated whether to use Classical or demotic Greek as the official state language.

Although a native speaker of Albanian, Ali was fluent in Greek, and the vast majority of his courtiers, secretaries, and physicians were Greek. It seems that Ali's knowledge of Turkish was minimal, at best. The Ottoman landowners of the region, too, overwhelmingly used Greek. Such travellers as the Englishman William Martin Leake wrote in their travel journals of the "high quality" and "clarity" of the Greek used in Ali's territories, and commented on the number and variety of institutions of learning based in Ioannina.

Just as Ali Pasha's influence on Hellenism was great but largely unwitting, so too was his impact on the Greek political affairs of the period. By the beginning of the 19th century, the Ottoman state was no longer prepared to pursue its policy of toleration towards Ali's accumulation of power, illegal activities, and treason against the empire. Ali had, by the turn of the century, become increasingly overt in his claims to exercise power and privilege in his own right, not simply as a representative of the Ottoman government. He had, for instance, entered into secret negotiations with both the French and the English, even while those powers were not recognized as Ottoman allies. His almost entirely Albanian army had grown huge, and it was becoming increasingly clear that these troops were just as likely to be deployed against the Ottoman army as against Ottoman enemies. Finally, in 1820, Ali declared himself independent, and as a result Ottoman troops were deployed against him.

All of these events were occurring at the same time as the Greek populations of the Ottoman empire were actively planning a revolution against their Turkish rulers. Ali provided a much-needed diversion for the revolutionary Greeks, who wisely timed the outbreak of the War of Independence to coincide with the battle between Ali's forces and the Ottomans. It is likely that without this intra-Ottoman conflict – a conflict

which taxed Ottoman military and economic resources – the initial stages of the War of Independence would not have succeeded. For his part too, Ali recognized the significance and potential usefulness of the Greek revolutionaries, and in an unsuccessful last-minute bid to augment his own resources against the Ottoman army, he tried to convince the Greek leadership that his cause and theirs were one and the same. Ali lived to see only the first phases of the Greek revolutionary movement, and was killed in 1822 by Ottoman representatives.

Ali remains a somewhat double-edged figure in the modern history of Hellenism. Reviled by Greek folk tradition as a cruel and despotic ruler, the oppressor of Orthodoxy, and a tyrant of epic proportions, he nevertheless played an important albeit indirect role in the development of Greek language, culture, and politics.

K.E. FLEMING

Biography

Born at Tebelen in Albania in 1750 into a noble but poor Muslim family, Ali attempted to overcome poverty by brigandage. As he gained control over much of Albania and Epirus, the Ottoman state sought to regularize his position by giving him a series of official posts. As pasha of Ioannina, he ruled most of mainland Greece and declared himself independent in 1820, thus diverting Ottoman attention away from the incipient Greek revolution. He was killed by Ottoman agents in 1822.

Alphabet

The ancient Greeks can be credited with providing humankind with the first fully alphabetic writing system – an intellectual achievement and technological leap of no mean significance. As is almost universally the case with such advances, the Greek alphabet was built upon a previously existing model – in this case, the consonantal script of speakers of a west Semitic language. Herodotus gives the credit to Cadmus and his fellow Phoenicians who had come to Greece in search of the abducted princess Europa:

> And these Phoenicians who had come with Cadmus ... and settled this country brought to the Greeks, among many other arts, the letters – which, I believe, were not previously known to the Greeks. Eventually they changed the sound and the shape of the letters. In this time, it was mostly Ionian Greeks living around the Phoenicians, who, having learned the letters from them, used these, making a few changes in their shape. The Greeks still called the letters "Phoenician", as was right, since the Phoenicians had brought them to Greece
>
> (Herodotus, 5. 58–61)

Modern scholarship has been almost unanimous in its agreement with Herodotus regarding the Phoenician source of the alphabet.

Herodotus was probably also accurate in envisioning that the Greek adaptation of the Semitic consonantal script took place in a setting in which Greeks and Phoenicians lived in close proximity to one another. Beyond that, the Greek alphabet may have made its first appearance in the Aegean among the West Ionic speakers of Euboea, bordering upon the region of Boeotia in which Cadmus is reported to have settled. The actual Greek acquisition of the Phoenician script, however, probably took place in some other locale and somewhat later than the date in the 2nd millennium BC in which Herodotus' Cadmus would have arrived in Greece.

Prominent among those places that have been proposed for the Greek adaptation of the Semitic writing system are Crete, Rhodes, Al Mina, and Cyprus. Of these, the most compelling candidate (on both linguistic and non-linguistic grounds) appears to be Cyprus, where literate Greeks writing with a syllabic script (the Cypriot Syllabary) lived side-by-side with Phoenicians using their consonantal script. The probable date of adaptation is the early 8th century BC (or possibly even the late 9th century BC).

The Phoenician script, like other West Semitic writing systems of antiquity, consists only of characters for consonants; vowels are not directly represented in Phoenician orthography. Since the Phoenician language possesses several consonants not occurring in Greek, the Greek adapters of the Phoenician script had at their disposal several superfluous consonantal symbols. These they converted to vowel characters: Phoenician *aleph*, representing a glottal stop, was adopted as a symbol for the vowel *a*, that is *alpha* (A); Phoenician *he*, the symbol for *h*, became Greek *epsilon* (E), spelling *e*; *'ayin*, symbol for the Phoenician voiced pharyngeal fricative, was taken over as *omicron* (O), representing Greek *o*; *yod*, the character for *y*, became Greek *iota* (I), used to spell *i*; and Phoenician *waw*, *w*, came to be used for spelling the Greek vowel *u* – the letter *upsilon* (Y, as well as being used for the consonantal character called *digamma* (F), representing *w*). In this way, those Greeks who adapted the Phoenician script for their own use created the first writing system to represent systematically both individual consonant and vowel sounds.

In time, two additional vowel characters appeared in the Greek alphabet. The Phoenician letter *ḥet*, representing a voiceless pharyngeal fricative, was first used for Greek *h*. The consonant *h* did not, however, occur in certain dialects of Greek (such as Cretan and East Ionic); in these, the Greek symbol derived from *ḥet*, that is *eta* (H), came to be used to represent a long vowel *R*. In parallel fashion an additional vowel character was created (being derived from the symbol *omicron*) in order to represent the distinct long vowel *ō* – the

character *omega* (Ω) – and was appended to the very end of the alphabet. Prior to these developments, *epsilon* and *omicron* had been used for representing both short and long *e* and *o* respectively.

The Greek adapters of the Phoenician script included in their alphabet two different characters representing *s*- sounds. One of these stands in the alphabetic position of the Phoenician letter *ṣade* (representing a so-called emphatic fricative or affricate, a consonantal sound characteristic of Semitic languages), the other in the position of Phoenician *shan* (Hebrew *shin*, symbol for *sh*). The former of these corresponds to the Greek letter commonly called *san* (M), the latter to that called *sigma* (Σ). The inclusion of both in the early Greek alphabet suggests that the Greek dialect of the adapters was one in which two distinct *s*-type sounds occurred – a picture consistent with a Cypriot origin of the alphabet. Most Greek dialects had only a single *s*-sound, however, so that the various local, or epichoric, varieties of the Greek alphabet that developed as the script spread across the Greek-speaking regions retained only one of these two symbols.

The name of the character *sigma* is certainly secondary, not continuing a Phoenician letter name (though the contrary claim has been made), and was derived from the Greek root *sig-*, seen in the verb *sizo* ("I hiss"), having an earlier stem **sig-yo-*. Herodotus (1.139) writes that among some Greeks the character *sigma* is itself given the name *san*, and this is also the name by which the latter is commonly denoted in Greek poetry. In all likelihood, *san* was the early Greek name of the *sigma*-character (Σ) and simply continues the name of the corresponding Phoenician letter, *shan*. The original Greek name of that non-*sigma s*- character, the one more commonly called *san* (M, corresponding to Phoenician *ṣade*) is thus unknown, the name *san* having become affiliated with it in those epichoric alphabets from which the *sigma*-character was excised.

Also noteworthy is the inclusion in the early Greek alphabet of two double-consonant characters (i.e. letters that represent a sequence of two individual consonants). The letters in question are Greek *zeta* (Z) and *xi* (Ξ). *Zeta* represents the sequence *zd* (having become *z* in modern Greek) and corresponds to the Phoenician letter *zayin* (symbol for *z*); while *xi* was assigned the value of *ks* by the Greek adapters, and is derived from the Phoenician symbol *samek* (representing *s*, though perhaps earlier with a value such as *kʸ*). The presence of these symbols in the early Greek alphabet is a curious matter, given that they are completely redundant; in other words, the consonant sequences that they represent could have been written using two individual consonant letters. Thus, the sound sequence of *zeta*, for instance, could have been spelt *sd* (*sigma* (Σ) + *delta* (Δ); in accordance with Greek phonetic structure, in this context *sigma* would automatically have the voiced value *z*); and, similarly, the sound sequence of *xi* could have been spelt *ks* (*kappa* (K) + *sigma* (Σ)). The incorporation of these characters in the alphabet again points to Cyprus as the place of adaptation, where similar biconsonantal symbols are properly accounted for within the structure of the Cypriot Syllabary.

In addition to the Greek letters that the adapters derived from corresponding Phoenician characters, and to the vowel letter *omega*, added to the end of the alphabet, certain of the local Greek alphabets are characterized by the presence of three additional letters, immediately preceding *omega*. These are the so-called "supplementals", having no formal Phoenician counterparts. One of these supplementals is the letter *phi*, representing an aspirated stop *ph* (which later becomes the fricative *f*). The second is *chi*, spelling an aspirated velar stop *kh* (later a velar fricative, often transcribed *ch*). The third is yet another biconsonantal character; in this case one representing the sequence *ps*, namely *psi*. As will be seen below, however, different values are in some places attached to these two last-named letters.

The numerous regional forms of the alphabet that developed among the ancient Greeks can be subdivided into three fundamental types on the basis of these supplemental characters. To begin with, there are some epichoric alphabets that lack the supplementals. These are the so-called "primitive" scripts of Crete, Thera, and Melos (also called the "green" scripts, after the colour-coded map of Greek alphabets which was included in Kirchhoff, 1867, most recently republished in 1973). In those alphabets that do include the supplemental characters, the letter *phi* (Φ) appears everywhere with the value *ph*. Differences occur, however, in regard to the remaining two supplementals.

In the "blue" alphabets (again, so called after Kirchhoff's map) *chi* appears as C, representing *kh*; and *psi* (Ψ) has the value *ps*. Among a subset of blue alphabets, however, the supplemental *psi* does not occur (and *ps* is spelt with two letters: *phi* + *sigma*; in the same way these alphabets lack the Phoenician-based biconsonantal letter *xi* (Ξ), and spell *ks* as *chi* + *sigma*). The blue alphabets lacking *psi* have been dubbed "light blue", the remainder "dark blue". Light blue alphabets were used, for example, in Attica and on some of the Aegean Ionic islands; Corinth, Mycenae, and the Ionic cities of Asia Minor, among other places, used the dark blue alphabet.

A large number of regional alphabets show yet a different configuration with regard to the supplemental characters; these are the so-called "red" alphabets. Here the symbol X (blue *chi*) represents not *kh*, but the sequence *ks* (and the Phoenician-based Ξ, representing *ks* in dark blue alphabets, does not occur). Moreover, the symbol Ψ in the red alphabets does not spell *ps*, as in the dark blue alphabets, but is used to represent *kh* (and there is no single symbol for *ps*). The order of the supplementals in the red alphabets is X (*ks*), Φ (*ph*), Ψ (*kh*), versus dark blue Φ (*ph*), X (*kh*), Ψ (*ps*). Among those places using red alphabets were Euboea (and its colonies), Boeotia, and Thessaly.

In 403 BC the Ionic alphabet (a dark blue script) was adopted by Athens as its official alphabet. Within a few decades, this Attic alphabet had spread throughout the Greek-speaking world and replaced most of the regional varieties. Beyond being the ancestor of the modern Greek alphabet, this script would have great influence on the development of writing in Europe, and beyond.

St Cyril and St Methodios, accompanied by other Greek missionaries, set out in the 9th century AD to bring Christianity to the Slavs. As a part of their evangelistic efforts, and on the basis of their own Greek alphabet, the saints developed two alphabetic writing systems with which the Bible could be translated and recorded in the Slavic language of their converts (Old Church Slavonic). One of the scripts, Glagolitic, would survive only in limited usage, but the other, Cyrillic, would give rise to

the writing systems of numerous different Slavic peoples – Russian, Ukrainian, Serbian, Bulgarian. The Russian Cyrillic alphabet would in turn be adapted for writing various non-Slavic languages of Eurasia. The alphabetic scripts which, by tradition, St Mesrop designed for writing Armenian and Georgian (5th century AD), though perhaps of mixed heritage, were also clearly fundamentally based on the Greek alphabet.

It was a Greek alphabet of Magna Graecia, of the red variety, that was acquired by the Etruscans in the 7th century BC. This in turn was transmitted to various peoples of the Italian peninsula, most significantly to the Romans. The Roman alphabet probably inspired the development of the Runic scripts of the Germanic peoples of Europe (and perhaps the curious Celtic Ogham script as well), but, more importantly, was spread to Europe itself, both by Roman armies and, in time, by the Roman Catholic Church. Acquired as the writing system of English and other languages of Europe, it would be spread around the globe. In the final analysis, all alphabetic writing systems in use today have their origin in the Greek alphabet, with the exception of the Han'gul script of Korean.

Altars

Altars of one kind or another have been employed continuously from a very early period in Greek history, but the two contrasting dictionary definitions, a "flat-topped block for sacrifice or offerings to a deity" and a "communion table" point to significant discontinuity.

Prehistoric altars could be portable ("tables of offering") or permanent. The latter include rough stones (Mycenae), bench altars (Knossos, Mycenae, Kea, Phylakopi, Tiryns), and some freestanding structures. Of the last, one, apparently used for human sacrifice, comes from Middle Minoan Crete (Anemospilia, Archanes), another stands in the central court at Phaestus, and a further example is represented in the frescos of Xeste 3 at Akrotiri on Thera. In Early Bronze Age Crete stone-built altars are associated with tombs. Sometimes (sanctuary of Apollo Maleatas, Epidaurus, prehistoric phase) altars were formed of the gradually accumulated debris of offerings, whether of sacrificial animals or material gifts, deposited on a sacred spot. By the Archaic period altars were often regular in shape, frequently made of ashlar masonry and with some architectural decoration (e.g. volutes, mouldings, friezes: Cape Monodendri, Miletus).

The most prominent altar type of later antiquity (including the Classical period) was the built *bomos* (platform altar), sometimes an isolated structure, but normally associated with a temple and standing outside its eastern front. On this sacrificial victims were burned. Altars were still sometimes (altar of Zeus at Olympia) composed of debris. From the Hellenistic period some public altars were enclosed by huge, monumental structures and bore extensive sculptural decoration (Great Altar of Zeus at Pergamum). Heroes and chthonic deities, as distinct from the Olympian gods, had a ground altar (*eschara*) which allowed wine and blood to soak into the earth, their natural home.

Smaller private altars, domestic or funerary in function, and of various shapes, are also found. Funerary altars, often round and decorated with garlands and bucrania (the decoration refers to the garlanding of sacrificial animals) are common only in later periods, especially the Roman. Not all offerings were sacrificial: wine, cakes, etc. might be appropriate, according to the occasion, and were more commonly offered on the smaller altars.

In Christian practice the altar originally connoted the table (*iera trapeza*, "holy table") of the Last Supper and was the location of its ritual re-enactment in the liturgy. Later it acquired a variety of symbolic connotations (e.g. Christ's tomb). The first Christian altars (up to the 4th century AD) were mostly small, wooden, and portable. One later type is simply a translation of this into stone. The solid rectangular stone form that became most common may be derived from the tombs of the martyrs, where it was customary to celebrate the Eucharist, in commemoration of their sacrifice. Also connected with this custom was the practice of containing relics of the martyrs within the altar, or in a crypt beneath.

In Christian times the altar continued to be closely associated with the chief sacred building – the church – though now it was situated inside. The interior location allowed it to be adorned with coverings, and to carry symbols permanently (crosses, candlesticks, etc.), although this development did not occur before the 10th century AD. Often an elaborate canopy (ciborium) was raised over the altar.

In spite of the evidence for some degree of overlap between the pagan and Christian traditions (e.g. in the use of sanctuary

sites, iconography), and the possibility that pagan altar structures had some influence on Christian types, there is no evidence for either material or ideological continuity in the case of altars. The former, in any case, would surely have been offensive to Christians. Nevertheless, as the idea of sacrifice inherent in the death of Christ and commemorated in the liturgy became more prominent in Christian thought, there was some convergence of the two traditions, although in Christian practice the sacrifice at the altar is symbolic.

Amalfi

Port on the west coast of Italy

Amalfi is a seaport in Campania, 50 km south of Naples on the rocky estuary of the Dragone on the north side of the Gulf of Salerno. First mentioned in AD 596 by pope Gregory the Great and frequently mentioned by Constantine VII Porphyrogennetos (913–59) in *De Administrando Imperio*, virtually nothing is known of Amalfi's early history beyond its importance with Naples as a Byzantine naval base. This was signalled in 664 when it was visited by Constans II (641–68) during what proved to be the last visit of any eastern emperor to his possessions in Italy. At the close of the 9th century it formed part of the Byzantine duchy of Naples, from which it became separated by the Lombards. Nominally subject to the emperor in Constantinople, it exploited this status to become, with the Venetians, one of the principal carriers in the east–west trade. Bishop Liutprand of Cremona mentioned the merchants of Amalfi as the suppliers of purple silk to Italian prostitutes and monks; presumably churches and royal courts should be numbered among their customers too, since Liutprand's comments had been occasioned by the confiscation of his own purchases of purple silk by the Byzantine customs authorities. Although there is no surviving record of an Amalfitan colony at Constantinople before the 11th century, it is possible that there were Amalfitan and Venetian commercial colonies in the capital by the middle of the 10th century, since Liutprand mentions "Venetici et Amalphitani" in the army of Nikephoros II Phokas (963–69) and these were presumably men settled in Constantinople. Amalfitan connections at the imperial court secured permission to found a Benedictine monastery on Mount Athos sometime after 985.

During the 1050s the rulers of Amalfi tried to organize resistance to the Normans in southern Italy. In this they failed and in 1073 the city passed under the control of the Norman Robert Guiscard and became part of his duchy of Apulia. The position and privileges of the Amalfitans in Constantinople were to suffer as a consequence. In 1082 it was merchants from Amalfi settled in Durazzo who opened the gates of that town to Guiscard, eight months after a Venetian flotilla had secured the town for the Byzantines. In the same year their trading privileges in Constantinople were subordinated to those of Venice. Again in 1147, when Roger of Sicily attacked the cities of Corinth and Thebes, the Amalfitan commercial quarter was closed down. Nevertheless, although no longer pre-eminent in the Italy–Constantinople trade, there were still Amalfitan merchants living in Constantinople in their quarter clustered around the church of S. Maria de Latina in 1204, since it was one of the quarters attacked by the Greek populace in that year. If after 1073 Amalfitan trade in the Aegean was to be eclipsed by that of Venice and it was in many ways to become a trading centre of the second rank, the port was to remain a wealthy one, with links to Antioch, Acre, and Alexandria, with a reputation for trading voyages and links with Arabs, Sicilians, and Africans.

The cathedral church of St Andrew in Amalfi still has the bronze doors made in Constantinople by a certain Simeon sometime around 1065 and commissioned by the rich Amalfitan merchant Maurus, son of Panteleon, whose family owned property in Constantinople. The doors were much copied by other ecclesiastical establishments in Italy in the 11th century, most notably by abbot Desiderius of Montecassino who sent the measurements of the door to Constantinople to have a set of bronze doors manufactured. The money for this additional set of doors was raised by the same Maurus.

PETER LOCK

Summary

A port on the coast of Italy 50 km south of Naples, Amalfi was originally founded as a Byzantine naval base, probably in the 6th century. By the 10th century it had become a major trading centre. An Amalfitan monastery was founded on Mount Athos in the late 10th century. By the 11th century there was an Amalfitan colony in Constantinople.

Amasis

Potter and painter of the 6th century BC

The potter Amasis first became known when a vase (560 BC) signed with his name *Amasis me poiesen*, ("Amasis made me") was found at Vulci in 1828. In all, eight black-figure vases bearing his signature are known, and their decoration has often been attributed to a single painter known as the Amasis Painter. Amasis' other work as a potter consists of two vases for Lydos and a cup decorated by a red-figure painter. His earliest signature as a painter occurs on a fragmentary band-cup of around 550 BC.

The name Amasis is a Hellenized form of the common Egyptian name A-ahmes. This has resulted in much scholarly debate as to the potter's origins. It has been suggested either that Amasis was an Athenian named after the Egyptian king Amasis (Ahmosis) or that he was not Athenian by birth and that his name was adopted in Ionia or after he came to Athens. Those who support the former hypothesis argue that the potter and the painter are different men; according to the latter view, the potter and painter are identified as the same person.

The Amasis Painter decorated a wide range of shapes – such as belly- and neck-amphorae, *oinochoae* (wine jugs), cups, *lekythoi* (oil flasks), an *alabastron* (perfume vase), an *aryballos* (oil flask), and a tripod *pyxis* (box), as well as small and large plaques. He did not, however, restrict himself to standard types of vases, but explored different variations of certain shapes, as, for example, the cups and the neck amphorae.

The style of the Amasis Painter is usually considered conservative because, even when he adopted new conventions, he did not abandon established forms. The precision of drawing and the ability to work on different scales seem the main characteristics of his work. He also paid attention to the harmony between the shape of the vase and its decoration, as seen on the panel amphorae he decorated.

In the early stages of his career his style reflected the work of the Heidelberg Painter and of the Siana cup painters. From the former he adopted stately processions, garments with fringes, and certain conventions for the rendering of anatomical details, while the latter probably inspired him to adapt a procession of horsemen to panel-amphorae. Moreover, the influence of Cleitias may be seen in his miniature style. The Amasis Painter also shared a number of features with Lydos, such as the preference for symmetry in his compositions as well as certain details in drawing. Although he used the common black-figure floral ornaments above the panels of his scenes, he reinforced the frames by more than one glaze lines, and a vertical band of meander or chevrons. He used bands of upright buds or palmette and lotus to decorate the area above the panels on amphorae.

In the late phase of his career, instead of foldless drapery, he painted flat, angular folds, and women's flesh was drawn in outline, not white on black, the standard convention of his time. Other characteristics of his work include a change in the ornament framing his compositions – the lotuses lose their central leaf – and the occasional omission of the ground line for his figures. The Amasis Painter demonstrated a great interest in the representation of jewellery and armour, especially of shield devices, as well as of architectural elements (fountain houses, column shafts, and a distyle *in antis*), which offered opportunities to represent spatial depths. He often used stippling for the hairy bodies of the satyrs, figures who had features in common with those drawn by Lydos, and for head-hair and beards. The growing understanding of the human body was reflected in his figures, which gesticulated expressively.

The Amasis Painter decorated vases with a wide repertoire of scenes that extend from the Olympian gods and heroes to daily life in Athens and the Attic countryside. Although several of his figures are labelled with painted inscriptions, the scenes are not always easily recognizable. He prefers to fill out his scenes with figures that either participate in the action or act as mere spectators; only occasionally did he concentrate on just the essential elements of the subject. Dionysus is one of his favourite characters, standing between satyrs, maenads, and mortals or supervising the vintage; the hero Heracles is represented being received on Mount Olympus after his death. His mythological scenes are well composed but rarely show the originality of his representation of the divine stables. The Amasis Painter was one of the first to introduce complex everyday scenes on vases – such as a wedding procession, the fullest early pictorial account of an Attic wedding – women at various stages of wool working and weaving, a hunter's return, and a cavalcade. He also demonstrated a consistent inclination to blur the lines between the realms of mortals and immortals or to combine the two.

The vases decorated by the Amasis Painter were widely distributed in the ancient world, as is also the case with other Attic potters and painters: in south Russia (Berezan), Italy and Sicily (Cumae, Capua, Gravisca, Vulci, Orvieto, Chiusi, Cerveteri, and Selinus), North Africa (Naucratis, Cyrene), Cyprus, and Greece (Athens, Eleusis, Tanagra, Perachora, Kavalla, Rhodes, Samos, Delos). Surviving signed works are now held in various museums around the world, including the Museo Gregoriano Etrusco in the Vatican, the Museum of Fine Arts in Boston, the British Museum in London, the Louvre and the Cabinet des Medailles of the Bibliothèque Nationale in Paris, the Martin von Wagner Museum at Würzburg University, and the Getty Museum in Malibu.

Ambelakia

Town in Thessaly

The village of Ambelakia is situated in the prefecture of Larissa in Thessaly, on the northwest slopes of Mount Ossa (Kissavos), at a height of 390 m. Although it is now only a village with fewer than 500 inhabitants, it was prosperous during the Ottoman period (Tourkokratia) and it made an important contribution to modern Greek culture. It was particularly famous for its commercial development in the late 18th and early 19th centuries. As the name Ambelakia suggests, the surrounding region produces wine.

The establishment of the village of Ambelakia is generally dated to the beginning of the 16th century. There has been much debate, however, about whether the site was inhabited in ancient times, since according to 17th-century sources ancient coins and bronze statues of Heracles were found in the area. In the late 18th century a bronze statue of Heracles was given to Gregorios Konstantas, who was the director of Ambelakia's renowned school. In Byzantine times the region of Ambelakia may have belonged to the monastery of St Demetrios, ruins of which survive today on the eastern slopes of Mount Ossa. Ambelakia was never inhabited by Turks, and, until Thessaly was annexed to the modern Greek state in 1881, the population was exclusively Christian, although there were many Turkish inhabitants in the surrounding region. G. Kordatos maintains that during the Ottoman period Ambelakia, like many villages in Pelion and Epirus, belonged to the administrative category of *waqf* (pious endowment), and was not suppressed by the Ottomans. N. Vees and A. Vakalopoulos have argued that the first inhabitants of Ambelakia came from the village of Lykostomio when it was occupied by the Turks in the 14th century and that the people decided to move further up the mountain. A scholar from Ambelakia,

Ambelakia: the Schwartz house, built in 1787, now a museum

Leonardos, has suggested that there was a village even further north than Ambelakia, in the area of Paliochori.

The school of Greek letters, the Hellenomouseion, was established after 1723. In 1873 Diamantes Maniares contributed generously towards the construction of the famous Maniareios Scholi, which was equipped with the most modern science laboratories, gardens, and accommodation for the school's teachers. The building itself was remarkable for its architecture, but unfortunately collapsed in 1928. World War II dealt the final blow to the vivid intellectual and commercial life of the town, and what now remains is just a small village.

The first agricultural cooperative in Greece was established in Ambelakia, and thus the town became famous for its economic activity and for its role in European economic and social history. The French scholar Boulanger thought that the cooperative at Ambelakia was the first one in Europe and that the spirit of financial cooperation and the idea of building a strong capital economy out of the work of many was first born in Ambelakia. Marxist Greek scholars such as Kordatos have argued vehemently against this view. What is certain is that the cooperative organization between merchants, craftsmen, workers, and farmers established in Ambelakia proved beneficial for the town's cotton industry and intellectual life in the 18th and 19th centuries. Well-endowed libraries were built and the best scholars of the day were invited to teach at the local schools. Many eminent intellectuals of the Greek Enlightenment period – scholars such as Evgenios Voulgaris, Konstantinos Koumas, Gregorios Konstantas, Spyridon Asanes, Georgios Trikalinos, and even Rigas Velestinlis – were associated with the intellectual life of Ambelakia. At least two major works of the Greek Enlightenment were published with a generous subsidy from Ambelakia, *Geographia Neoteriki* (*Modern Geography*, 1791) by Daniel Philippides and Gregorios Konstantas, and *Lexikon tis Ellinikas Glossas* (*Dictionary of the Greek Language*, 3 vols, 1809–16) by Anthimos Gazes.

The town became well known abroad for its textile industry and had close trading contacts with businessmen in the great commercial centres of Europe. Its most important monuments are the church of St George with frescos and decorations carved in wood, and the Schwartz mansion. Georgios Mavros Schwartz was the president of the Ambelakia agricultural cooperative and his house was its headquarters. It was built in 1787 and was decorated with wall paintings and carved wooden ornamentation which are important examples of folk art. The mansion was purchased by the Greek state in the 1960s and now functions as a local folk museum open to the public. The inhabitants of Ambelakia also built the church of Hagia Paraskevi in Tempe in 1651.

ANDROMACHE KARANIKA-DIMAROGONA

Summary

A town in Thessaly on the northwest slopes of Mount Ossa, Ambelakia was probably founded in the 16th century and flourished during the Tourkokratia on the strength of its cotton industry. It was the first town in Greece to have an agricultural cooperative. It was also an intellectual centre for scholars of the Greek Enlightenment. It is now a small village.

Amphipolis

City in Thrace

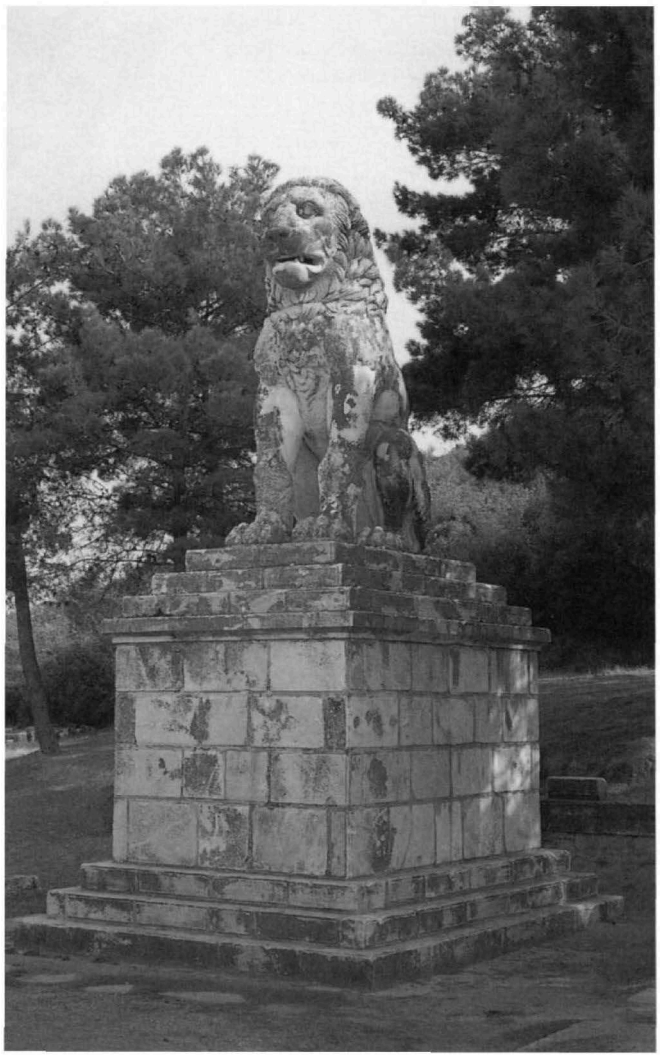
The Athenians and their allies under the general Hagnon, son of Nicias, founded Amphipolis in 437/36 BC on the site of the earlier Thracian city of Ennea Odoi ("Nine Ways"). According to Thucydides (4. 102) Hagnon named it Amphipolis because the river Strymon flowed on each side of the city. It was inhabited by a mixed Greek population, including many Ionian settlers from neighbouring cities, and controlled the rich Strymon basin and its hinterland.

Early in the Peloponnesian War (424 BC) it surrendered to the Spartan general Brasidas; two years later Cleon's unsuccessful expedition to recover it ended with his own death as well as Brasidas' in the battle of Amphipolis (422 BC). Although in the Peace of Nicias (421 BC) there was a special provision for Amphipolis's restoration to Athens, Athenian operations in the region, which did not cease until the time of Philip II of Macedon, indicate that the city was not totally under Athenian control.

The economy of Amphipolis did not depend solely on the rural population which cultivated the Strymon valley, but also on merchants and craftsmen. The city's prosperity is reflected in a lavish series of coins after the Peace of Nicias. Inscriptions provide information about the administrative organization of the city, and the ways in which it controlled trade and protected the life and property of its citizens through its institutions and special officials.

In 357 BC Philip II conquered Amphipolis and established a Macedonian garrison. The city became a royal mint as well as the base for Macedonian operations to the east of the Strymon. In 334 BC the fleet of Alexander the Great set sail on its Asiatic campaign from the harbour of Amphipolis. Moreover, the importance of the city at this period is indicated by Alexander's decision to make Amphipolis one of the six major cult centres of his empire – the others being Delos, Delphi, Dodona, Dion, and Kyrros – and to build a magnificent temple of Artemis Tauropolos, a plan which was never realized.

After Alexander's death his mother Olympias issued a decree by which the garrison of Amphipolis was given to Cassander. It was here that Alexander's wife Roxane and his son and heir Alexander IV were exiled. The strategic location of the city, commanding the bridge over the Strymon, and its



Amphipolis: the Lion monument, on the west side of river Strymon, dating from the 4th century BC

hinterland, rich in agricultural products, precious metals (gold and silver), and timber, ensured its prosperity into Hellenistic and Roman times and it became a strong military, economic, and cosmopolitan centre.

Although archaeological surveys in the area of Amphipolis were undertaken in the 19th century, it was not until 1956 that systematic excavations commenced, bringing important finds to light. A large part of the Classical city wall was revealed. Seven gates provided access to the city, while round towers in elevated positions along the wall controlled all movements on both the east and west banks of the river. The largest and strongest gate was the so-called Bridge Gate, mentioned by Thucydides (4. 103, 108) in connection with the battle between Cleon and Brasidas in 422 BC. The fortifications of the city underwent repeated repairs in Roman and Byzantine times.

In addition to the city walls, an inner fortification wall encircled the acropolis of Amphipolis, which was located on a hill at the most prominent part of the site. At the west end of the acropolis and inside its Classical enceinte, a house of the 4th century BC was excavated, indicating the existence of a Classical suburb in this area, which continued to be inhabited in the Hellenistic period. Moreover, a Hellenistic house of the 2nd century BC with painted walls recalling the First Pompeian style was found in the south sector of Amphipolis.

The first large public building to be identified from epigraphic evidence was the gymnasium. It was located in the southeast sector of the city, between the inner and the outer walls, and next to a narrow water channel, indispensable to the function of the building. It was built by the Hellenistic period and remained in use until the early imperial period, when it was probably destroyed by a fire. An important inscription of the 1st century BC provides information about the education of youths, the society of Amphipolis, and its topography, mentioning an agora, workshops, a road network, and a theatre.

The cult of the king of Thrace, Rhesus, son of Eion and Cleio, already attested in Homer, is the earliest known cult at Amphipolis. In addition, there are sanctuaries of the muse Clio (first half of 4th century BC), of Attis, and a Thesmophorion or Nymphaeum (5th century BC) outside the north city wall, and an open-air structure with niches for the cult of Attis and Cybele, which became popular in Hellenistic and Roman times.

Classical and Hellenistic cemeteries have been discovered outside the city walls. Numerous graves of various types have yielded a vast quantity of grave offerings, such as gold jewellery, terracotta figurines, pottery, bronze objects, and grave stelae. An impressive example of burial sculpture of the 4th century BC is the Monument of the Lion, on the west side of the river Strymon. It was set up in honour of an Amphipolitan citizen, probably Laomedon, one of Alexander's admirals. Today it stands restored on a high podium at the spot where it was found.

After the battle of Pydna (168 BC) Amphipolis became the capital of one of the four administrative districts (*merides*) into which Macedonia was divided by the Romans in order to achieve the break-up of its political unity. Although in the mid-1st century BC Amphipolis suffered invasions by Thracian tribes, which resulted in the destruction of its buildings, both the ancient literary sources and the archaeological evidence reveal that the city flourished as a commercial and artistic centre as well as a mint down to the final years of the Roman empire. With the support of Roman emperors, especially Augustus and Hadrian, Amphipolis remained one of the most important urban centres in Macedonia, as is reflected in its monumental buildings with mosaic floors and mural paintings.

The importance and prosperity of Amphipolis, through which St Paul passed on his journey from Philippi to Thessalonica (AD 49/50), continued in early Christian times, largely because the Via Egnatia ran through the city. Amphipolis became the seat of a bishop and remained as such until AD 692. The discovery of a number of early Christian monuments on the ancient acropolis of Amphipolis – four basilicas with impressive polychrome mosaic floors, a large rectangular building, often identified as an episcopal palace, and a hexagonal church – demonstrates the importance of the city as an urban and religious centre in the early Christian period. The total area covered by Amphipolis in this period is not known with certainty, but the arrival of plague and the raids of the Slavs in the 7th century contributed to the city's decline, gradually resulting in its demise as an urban centre.

It is likely that the city was destroyed by the Slavs' attacks in the 8th or 9th century AD and many of its inhabitants resettled at the mouth of the river Strymon very close to the ancient Eion, where they established a new city on the harbour, named Chrysopolis. Large parts of the Byzantine fortification of the city, a small church, and other scattered structures are preserved. The name Amphipolis continued to be used by Byzantine authors. Furthermore, the site of the ancient city, known at this time as Popolia, retained its strategic importance until the end of the Byzantine empire, as is demonstrated by the fortifications and other activities in the region during the late Byzantine times. Two towers were built on either side of the Strymon, one of them erected in 1367 by two generals, the brothers Alexios and Ioannis, who were also the founders of the monastery of Pantocrator on Mount Athos. Both towers at Amphipolis were owned by the monasteries of Athos, and were probably used to store the agricultural produce of the monastic properties (*metochia*) in the area.

ELENI ZIMI

Summary

City in Thrace, first founded by the Athenians and their allies in 437/36 BC. Its strategic position, commanding the crossing of the Strymon, and its rich hinterland ensured its prosperity throughout antiquity. Its size and prosperity may have been reduced by the Slav invasions of the 7th century, but it remained the seat of a bishop until 692. The city was probably destroyed in the 8th or 9th century when its population was resettled near the mouth of the Strymon.

Anastasios of Sinai, St

Theologian of the 7th century

The life of this priest-monk is virtually unknown, but he lived in turbulent times. His writings give us a fascinating insight into the world of the Christian Near East at a time when the Monophysite and Monothelite controversies were still raging, and when it had recently been subject to the traumas of the Islamic conquest.

Anastasios travelled widely in Egypt and Syria to refute Monophysites of various types; he was attacking them in Alexandria before 642. His arguments were crystallized in his *Hodegos* or *Guide*. His stance is resolutely Chalcedonian but also exhibits great tact and diplomacy, for example in his recommendation that only pre-Chalcedonian authorities should be used in discussions with the Monophysites. He claims to detect the source of Monophysitism in the categories of Aristotle. Other works include *Two Sermons on the "According to the Image"*, against the Monophysites; a work *Against the Monothelites*; a work *On the Holy Synaxis*; a treatise on the *Hexaemeron*, of which only the last book of 12 survives, and the famous *Questions and Answers*.

The *Questions and Answers*, in the form in which we have them, are certainly not the work of Anastasios. The substance is definitely Anastasian, but has been added to and reworked with great liberty by a later writer, or writers. The work of disengaging the Anastasian from the pseudo-Anastasian content is still in progress. This summary therefore can be only tentative. The question–answer format has a long pedigree: it is found, for instance, in St Basil the Great, the pseudo-Macarius, and in the monks of Gaza, Barsanuphios and John. Anastasios shows a keen understanding of the difficulties of Christian life under Islamic occupation, allowing, for example, that in the absence of an ordained confessor an act of contrition will suffice. He declares: "Each man's conscience is the norm for the reception of the holy mysteries." The difficulties of the post-conquest established Church may have led him to stress the inner life of the Christian. Speaking of the indwelling of God, he asserts that when the soul has become a temple and a dwelling place of God, it loses all desire for churches that have been built, and for the sacraments performed in them – a very audacious statement, but perhaps encouraging for those unable to attend church. His *On the Holy Synaxis* shows that he had no antipathy against the established Church as such, but was appalled by the slovenly attitude of the congregations. He is particularly critical of those who turn up just in time for communion! He also deals with a host of other questions, concerning mixed marriages, money matters, and many other basic pastoral issues: can one, for example, take communion after accidentally swallowing water?

Anastasios was an original, lively, and highly engaging thinker; this becomes increasingly clear as the later accretions to his work are cleared away. He discusses the nature of the soul, the question of chance, the utility of prayer for the dead, the fate of children who die unbaptized, and the salvation of non-Christians. He stresses the common monotheism of Christians and Muslims, but was horrified at the desolation caused by the Islamic conquest. He has no time for the argument that the conquest occurred at the command of God: how could God, Anastasios asks, have urged the profanation of his own body and blood?

In the *Questions and Answers* frequent appeal is made to scripture and patristic witnesses, with citations from, for example, St Basil the Great, St Gregory of Nyssa, St Cyril of Jerusalem, St John Chrysostom, Mark the Monk, and St Maximos the Confessor. His edited dogmatic works reveal a staggeringly extensive range of sources. They confirm the impression given in the *Questions and Answers* that Anastasios was both an original and a deeply traditional thinker. Besides an almost exhaustive appeal to the Fathers, he also demonstrates a familiarity with the works of Aristotle and the Platonic tradition. While continuing to enjoy great authority in the Church, the works of Anastasios deserve to be far better

known than they are at present. Among his works is a story that perfectly sums up his own generous attitude to the Hellenic tradition. A certain scholar was constantly cursing Plato, until one night Plato himself appeared to him in a dream saying: "Man, stop cursing me: for you are only hurting yourself. I do not deny that I was a sinful man: but when the Christ came down into hell, truly no one believed in him before I did."

MARCUS PLESTED

Biography

Almost nothing is known of the life of this 7th-century theologian. He attacked the Monophysites of Alexandria around 640 and was a monk of Sinai by 700. His works include the *Hodegos (Guide)* and *Two Sermons on the "According to the Image"*, both against Monophysitism; *Against the Monothelites*; *On the Holy Synaxis*; a treatise on the *Hexaemeron*; and the *Questions and Answers.*

Anatolia

In geographical terms Anatolia (otherwise Asia Minor) occupies the territory of Turkey between the Aegean Sea and the Euphrates river. The western and southern coastal areas were part of the Mediterranean world. In the Graeco-Roman period several regions existed within Anatolia, corresponding to separate languages, cultures, and religious beliefs: Bithynia, Cilicia, Cappadocia, Galatia, Paphlagonia, and Pontus.

Anatolia has always been a crossroads of different peoples and cultures, and it was dominated at different times by different political and cultural entities. The Hittite empire was the major power in Anatolia in the Late Bronze Age but its collapse in *c.*1200 BC allowed new cultures to rise. At the beginning of the Iron Age neo-Hittite states were established in the southeast, and at the turn of the 9th century BC the Urartians emerged as a leading power in the east and northeast of the region. Both the Hittites and Urartians frequently clashed with their Assyrian neighbours. However, political difficulties in Anatolia never prevented close cultural contacts and the exchange of artistic ideas.

Greeks from mainland Greece started to settle the western shores of Anatolia and the offshore islands from about the 11th century BC onwards. Aeolians founded cities between the Troad and the gulf of Smyrna; the Dorians established six major cities in Caria and on the islands of Rhodes and Cos. The Ionians, who arrived in much greater numbers than either of these, established themselves between the two. The culture created together by these three peoples is known as East Greek. The 12 Ionian cities – Chios, Samos, Phocaea, Clazomenae, Erythrae, Teos, Lebedos, Colophon, Ephesus, Priene, Myus, and Miletus – were much the most advanced. Smyrna, in the north of Ionia, was in origin an Aeolian town, but at an early date it was captured by Ionians from Colophon.

In the 8th century BC the situation in Anatolia changed once again. The Phrygians emerged as a major political power, with their capital at Gordion. Relations between Phrygians and Greeks were close. Already in the 8th century BC the Phrygian king Midas was married to the daughter of Agamemnon, the king of Aeolian Cyme. This Midas was most probably the same one who sent a dedication (a throne) to the Greek sanctuary in Delphi. Decoration on some Greek pottery, bronze fibulae, cauldrons, bronze belts, etc. demonstrates Phrygian influence on Greek culture as early as the 8th century BC. Phrygia lost its dominant position after the Cimmerian raids of *c.*696 BC and became part of the Lydian empire, the dominant power from the mid-7th century BC having its capital at Sardis. The Ionian contribution to the creation of Lydian culture is witnessed in dress and in architecture (columns and relief panels). In Lydia and Phrygia buildings were decorated and protected by clay relief revetments, often decorated in a Greek style and depicting Greek mythological scenes. At the same time, Greeks took to worshipping the Anatolian goddess whom they knew as Cybele. Lydian rulers were hostile to Ionian and other cities. Alyattes destroyed Smyrna; Croesus subdued others but sent gifts to the temples in Delphi and Ephesus. This was a time when very close cultural links were forged between Lydia and the Ionians, bringing Graeco-Lydian art into existence. Lydian court life was more Greek than oriental in its physical aspects.

The Lydians were conquered by the Persians in 547/46 BC. For the next two centuries, until the conquests of Alexander the Great in 334 BC, this new Persian empire held mastery over Anatolia and the whole of the Near East, including the Greek cities of Anatolia. Many Ionians fled Persian conquest to establish colonies in the west and the east (around the Black Sea). Indeed the creation of Ionian colonies was already under way from the second half of the 7th century BC when Lydian pressure started to make itself felt.

Achaemenid art is a unique phenomenon. Monarchs started to create a court culture, bringing together artists from all corners of their huge domains. These artists, architects, and masons were employed by the king and executed work according to his tastes and wishes. During the construction of the palace in Susa, Darius recorded details of the programme of work: the ornamentation of the walls was brought from Ionia; the captives who worked the stone were Ionians and Sardians; Sardians and Egyptians collaborated on the woodwork; Babylonians on the brickwork; Medes and Egyptians on the decoration of walls and on goldsmiths' work. The sources of the materials used are also given: gold came from Sardis and Bactria; lapis lazuli and cornelian from Sogdiana; turquoise from Chorasmia; silver, ebony, and copper from Egypt; ivory from Ethiopia, India, and Arachosia; cedars of Lebanon were carried to Babylon by Assyrians, and thence to Susa by Carians and Ionians. The Ionian contribution to Achaemenid royal culture was considerable. Although Persian buildings, designed more for effect and ceremonial than for living, were inspired by Mesopotamia, masons were brought from Ionia and Lydia. Greek architectural orders and techniques were introduced to Persia. Nearly all the buildings at Pasargadae were built by

Ionians. Persian sculpture reveals Greek influence and practice in the treatment of drapery; seals show Greek craftsmanship, as do the wall paintings from Gordion. The tomb monuments at Xanthus are decorated with stone reliefs executed in Ionian style.

The Persian empire was divided into provinces (satrapies). Usually, each conquered country formed a separate satrapy, sometimes with a local family as nominal rulers. The provincial capitals housed a Persian civil service and garrison. The king introduced a system of gift-giving and *tributari*.

The Ionian Greeks were supported by Athenians in their revolt of 499 BC. This led to Persian–Athenian conflict. In 492 BC Darius sent a force against northern Greece and in 490 BC to central Greece. Ten years later Xerxes marched against Greece and sacked Athens. By the mid-5th century BC the Greek cities of the eastern Aegean were free, under the hegemony of Athens. After the Persian Wars many Persian ideas filtered through to Athens. Persian metalwork had considerable influence on Athenian pottery – rhyton (drinking-horn) cups are an example. The same can be seen in Greek seals, where the Graeco-Persian style flourished in Anatolia, reaching mainland Greece and spreading throughout the Greek colonial world.

Alexander the Great put an end to the Achaemenid empire. He burned Persepolis and liberated Greeks, including artists and intellectuals who had been persecuted by the Persians. The establishment of Hellenistic kingdoms on the ruins of the Persian empire opened the way to further penetration by and of Greek culture. Greeks followed Alexander the Great to Anatolia and the Near East, establishing new cities and new cultural centres, but at the same time absorbing features of local cultures to create new and cosmopolitan traditions.

The Hellenistic period in Anatolia brought fresh military difficulties. In 302 BC Lysimachus, a Macedonian from Pella, invaded Asia Minor, fought against Antigonus, and secured victory for Seleucus in the battle of Ipsus (301 BC). Most of Asia Minor passed to him, and he proved a financially rapacious ruler until his defeat by Seleucus in 281 BC. Thereafter the region was in the hands of the Seleucids who, from the outset, continued Achaemenid institutional practice in the army and administration and in their colonizing policies. One of their capitals was at Sardis. By the peace of Apamea, negotiated between Antiochus III and Rome in 188 BC, the Seleucids relinquished their possessions north of the Taurus mountains, retaining Pamphylia and Cilicia.

The Mithridates family ruled Pontus from 302 BC. Mithridates IV established good relations with Cappadocia and Rome (whose ally, Pergamum, he helped in a war against Bithynia). His successor invaded Phrygia and Cappadocia, maintained friendly relations with Greece, and was honoured as a benefactor of Athens and Delos. Mithridates VI Eupator was the most famous king of Pontus, and Rome's most dangerous enemy in the 1st century BC. He conquered the whole of the Black Sea and annexed Bithynia and Cappadocia. During the First Mithridatic War against Rome (89–85 BC) in Asia his army swept all before it, and he ordered the massacre of Romans and Italians living there. He was welcomed in Athens and won over most of Greece, but the Roman response under Sulla (87 BC) brought him defeat; Athens was captured, and the war taken to Asia. Peace was arranged and Mithridates lived to fight another day: to further defeat in the Third Mithridatic War in 63 BC and an assisted suicide at the sword of a bodyguard when his son revolted against him prior to further alleged foreign exploits.

The culture of Hellenistic Anatolia flourished. Troy IX was a Hellenistic city furnished with temples, theatre, odeum, *bouleuterion* (council chamber) etc. Pergamum was a very important city, to the safety of whose fortress Alexander the Great's successor Lysimachus entrusted part of his treasure – 9000 talents. During the reign of Attalus I Pergamum became a wealthy and powerful state and the city a worthy royal capital. Its ruler could indulge in patronage of the arts, literature, and philosophy, and gain prestige and pleasure with his horses and chariots at Olympia and other Greek centres. Under Eumenes II the city achieved architectural eminence: the defended area of the acropolis was enlarged so as to contain a further large gymnasium and a second agora, the acropolis itself was built up on a series of grand arched terraces, and an advanced high-pressure water system put in place. The best possible use was made of the natural shape of the land to provide a dazzling backcloth to the expanding city below. The royal palace, barracks, and arsenal crowned the summit; lower down a library, second only to Alexandria's, overlooked the temple of Athena; on a lower level stood an altar to Zeus, 12 m high, which provided a rich opportunity for the local school of sculpture to portray the fight of the gods against the giants; still lower were the agora, and then a great terrace on arches, built into the rock, from which the theatre climbed up the hillside. In 130 BC the last member of the Attalid dynasty bequeathed this prosperous state to Rome and it became part of the province of Asia.

Ephesus and Miletus reverted to being centres of Hellenic culture in Asia Minor once they had recovered from Persian rule. Alexander the Great rebuilt Miletus. The temple of Artemis at Ephesus and the new marble temple of Apollo in Didyma were among the most impressive buildings anywhere in the Greek world.

Roman Asia, the jewel of the empire, comprised the territories of Mysia, Lydia, Pisidia, and Phrygia (Rhodes was added subsequently) along the western coast of Asia Minor. It was stable (the borders remained largely unchanged until the late 3rd century AD) and prosperous, and Hellenic influence remained strong. From 27 BC the province was under the authority of the Senate, administered by a proconsul based in either Pergamum or Ephesus. Administration varied from area to area, and many of the cities that had enjoyed a fair measure of autonomy under the Attalids retained it, despite their inclusion in the province. The province's economic strength was due mainly to its position astride the east–west trade routes, and that strength attracted migrants. Ports such as Smyrna, Miletus, and Rhodes flourished on the trade of foreign vessels passing through, and the cities invested their wealth in their own beautification. Greek notions of self-determination persisted in the cities, an echo of the polis. Schools of philosophy, education, and medicine functioned in Smyrna, Ephesus, and Pergamum; and Pergamum emerged as a centre for eastern deities such as Asclepius. The acceptance of older eastern gods and the toleration of newer ones was another visible link to the absorbent nature of Greek civilization. This was the Roman

province in which Christianity (initially, another cultural import assimilated from the east) and the early Church prospered.

With the foundation of Constantinople in AD 330, the division of the Roman empire, and the mutation of the eastern empire into the Byzantine, Anatolia became a cornerstone of this new Greek, Christian polity. As Byzantine power waxed and waned, so did the extent of its control over Anatolia (in opposition to Arabs and, subsequently and fatally, Turks). The Seljuk Turks' crushing defeat of the Byzantine army in Armenia in 1071 paved the way for the loss of control over most of Asia Minor. The Latin west was called to aid the Greek east, and the Crusades provided temporary relief for the Byzantines. Alas it was to be the Fourth Crusade of 1204 which captured and sacked Constantinople, splintered the Byzantine empire, and created a pale Latin imitation in its place (for less than 60 years in a portion of its territory). The reintegrated but reduced Byzantine empire had soon to face the Ottoman Turks, who captured Bithynia in 1339 and seized Adrianople in 1362. Constantinople itself fell, finally, in 1453. The Greek empire of Trebizond, far to the east on the Black Sea, one of the splinters resulting from the events of 1204, and ruled by the Grand Komnenoi, remnants of the penultimate Byzantine dynasty, fell a mere eight years later.

The Byzantine empire was the centre of Greek Orthodox culture for a millennium, and that culture permeated throughout all its regions and beyond. Christian ideology and norms, as well as church architecture, painting, illuminated writings, etc., created in Constantinople, were adopted, copied, and adapted throughout the Orthodox world. Hagia Sophia formed the great inspiration for architects. One of the finest examples of Byzantine church architecture was St John's in Seljuk, on the Aegean coast of Turkey: it is built to a cruciform plan, with a broad nave, chancel, and transepts, many cupolas, marble facings to the wall, and richly carved capitals. Above it rises the citadel, on the site of a Byzantine fort. Halicarnassus was a bishopric of Byzantine Caria. The southern shore of Turkey is particularly rich in Byzantine churches. Patara and its bishopric have been important since the 6th century. Recent excavation at Sinope has yielded remains of another Byzantine church with fine mosaics. In Trebizond stand the 14th-century church of St Eugenius, the coronation church of the Panagia Chrysokephalos, and its own, rich Hagia Sophia, noted for its murals; within 50 km, amid fortresses, churches, and deserted villages, are three spectacular cave-monasteries – the Panagia Soumela, St George Peristera, and St John the Forerunner Vazelon. The well-known monastery of Soumela continued to flourish under the Ottomans. Many churches – including the basilica in Dag Pazari – contain impressive mosaics, and many rock churches contain murals.

GOCHA R. TSETSKHLADZE

Summary

Geographically Anatolia is the land between the Aegean and the Euphrates river, comprising most of modern-day Turkey. Greeks settled on its western shores from the 11th century BC. From the mid-6th to the mid-4th centuries BC it was part of the Persian empire. It was conquered by Alexander in 334 BC and flourished. Called Asia by the Romans, it remained culturally Greek and formed the heart of the Byzantine empire until lost to the Turks between the 11th and 15th centuries.

Anatomy and Physiology

Repeated observations of human victims of warfare and accidents, and likewise of animal victims of hunting and sacrifice, probably underlie the remarkable familiarity with gross anatomy displayed in Greek literature from the *Iliad* to the early 5th century BC. Many Homeric descriptions of woundings bear witness to a precise knowledge of vulnerable points in the torso, notably of the anatomical disposition of the principal organs and bones, and of the likely consequences of lesions to each.

Only with the systematic use of dissection did Greek anatomical knowledge advance substantially beyond the level reflected in Homeric epic. A controversial passage in a 4th-century AD commentary on Plato's *Timaeus* claims that Alcmaeon of Croton (5th century BC) first dared to cut out the

eye and discovered its communication with the brain. Along with reports that Alcmaeon knew of the nasal passages and of certain features of the vascular system, this has led some modern scholars to conclude that Alcmaeon was the first to dissect animals for scientific purposes. Similar claims have been made for Democritus. There is, however, no conclusive evidence to support such inferences. Although several Presocratics displayed a keen interest in anatomical structures and in physiological processes such as perception, respiration, and reproduction, they clearly lacked close familiarity with the physical appearance and configuration of the internal structures they describe. According to Diogenes of Apollonia's extensive description (preserved by Aristotle) of the vascular system, for example, two independent networks of vessels (*phlebes*) are distributed throughout the body, one originating in the liver and serving the right side of the body, the other originating in the spleen and serving the left. The bilateral symmetry displayed by the external structure of the body here is apparently assumed to have an internal counterpart.

Hippocratic writings offer many anatomical observations (e.g. *On Places in a Human Being*, *On Fleshes*, *On Fractures*, *On Joints*, *Epidemics*, the pastiche known as *On the Nature of Bones*, and the Hellenistic treatise *On the Heart*). But no systematic Hippocratic treatment of anatomy as such is extant; a 27-line work of disputed date, *On Anatomy* – the shortest text in the vast Hippocratic Corpus – merely enumerates major internal parts of the human torso and summarizes their configuration. Diocles of Carystus, to whom Galen attributes the earliest treatise on anatomy, may have observed the womb in dissected mules, but there is no convincing evidence that he dissected human cadavers.

Aristotle, who occasionally refers to his lost work *Dissections* (*Anatomai*), dissected and vivisected various animals in the course of extensive zoological investigations that covered the lives, reproductive activities, and structures of well over 500 genera. He frequently referred to the human body, too, providing detailed observations on the vascular system and the internal topography of the body, particularly in his *History of Animals*. He acknowledged, however, that he relied on animal anatomy to make inferences about human anatomy and physiology (e.g. *History of Animals*, 1. 16. 494b21–4) and, like Empedocles and others, he made the heart, not the head or the brain, the centre of cognitive activity (whereas Alcmaeon, Democritus, Diogenes, the Hippocratic author of *On Sacred Disease*, and Plato had recognized the central role of the brain).

Spectacular advances in anatomical knowledge were made in the early 3rd century BC, when Herophilus and Erasistratus became the first – and apparently the last – ancient physicians to conduct systematic dissections of human cadavers. According to credible ancient sources they also performed vivisectory experiments on humans, probably on condemned criminals handed over to them by kings in the name of future benefits for all of humanity (Celsus, *Medicina*, proem. 23–26). Their discovery of the nerves, the four coats of the eye, the ventricles of the brain, the ventricles of the heart, the heart valves, the ovaries, numerous vascular structures, etc. had an enduring impact on the history of European anatomy and physiology. Herophilus and Erasistratus attempted not only to describe parts of the body but also to account for their functions on the basis of dissection and vivisectory experiments. They diligently explored respiration, digestion, the pulse, reproduction, and sensory and muscular activity.

Not all ancient physicians agreed, however, that physiological explanations, even if discovered or confirmed by dissections, are necessary to clinical efficacy. The Hellenistic Empiricist "school" by and large rejected physiological investigation and systematic dissection, claiming that the accumulation and transmission of clinical observations, notably of observed instances of successful treatments (even when the success remained unexplained) generally sufficed. Numerous later rival physiological and anatomical treatises, some known mainly through Galen, bear witness, however, to the continuing importance of anatomy and physiology. Though advocating divergent doctrines, Asclepiades of Bithynia, Archigenes, Soranus, and Rufus of Ephesus presented wide-ranging physiological theories based on anatomical beliefs. Furthermore, extensive dissections of animals were conducted in the 2nd century by Marinus, Quintus of Rome, Satyrus, Numisianus, Pelops, and Galen.

Ancient Greek anatomy and physiology culminated in Galen, whose authority went virtually unchallenged for more than a millennium. Aware of the remarkable scientific results which Herophilus and Erasistratus had achieved by means of human dissection, Galen at times wistfully conceded that their access to human cadavers had enabled them to make observations which eluded him, even though his repeated, meticulous dissections of – and vivisectory experiments on – apes, monkeys, pigs, goats, oxen, sheep, mules, horses, donkeys, mice, and other animals allowed him to correct the accounts of many predecessors. To some extent Galen's anatomy is characterized by the superimposition of the soft parts of apes upon the human skeleton, despite his frequent insistence that a dissecting physician should try to choose animals that most closely resemble human beings. He presented his anatomy most fully in his monumental *On Anatomical Procedures* 1–15 (of which more than six books are extant only in a 9th-century Arabic translation). Several shorter anatomical treatises also survive (e.g. *Anatomy of the Womb*, *Anatomy of the Nerves*, *Anatomy of Arteries and Veins*, and *Anatomy of Muscles*).

Galen insisted that anatomy is a prelude not only to surgery but also to physiology. His comprehensive commitment to a teleological explanation of every structure, part, activity, and susceptibility of the body is visible throughout his voluminous anatomical and physiological writings. He fused his expropriations of the theories of several precursors into a coherent teleological model, in which all major physiological activities – respiration, digestion, heartbeat and pulsation, sensation and perception, voluntary and involuntary movement, locomotion, reproduction – are interdependent and interactive. He adapted the four-humour theory of the Hippocratic author of *On the Nature of a Human Being*, introducing more systematic, elaborate correlations between the primary qualities (hot, cold, wet, dry), the elements (earth, air, fire, water), the humours, the four seasons, character types or "constitutions", and stages of life. Inspired by the Platonic theory of a tripartite soul, Galen argued that there are three souls ruling yet serving the body, each manifesting itself through a distinctive faculty (*dynamis*, i.e. a power to act or to be acted upon). In the brain resides the "psychic faculty" which, presiding over reason and

thought, renders sensation, perception, and voluntary motion possible. In the heart resides the "vital faculty", responsible *inter alia* for our emotions. And in the liver dwells the "natural faculty" responsible for nutrition. In *On Natural Faculties*, which Galen recommended to his readers as a sequel to *On Anatomical Procedures*, he added subsidiary faculties, including the "attractive faculty" (e.g. to explain how all parts of the body "attract" nutriment from the blood), the "retentive faculty" to explain how substances can remain in any given place within the body, the "alterative faculty" (e.g. to account for the conversion of food into blood), the "expulsive faculty" to explain secretions and excretions, etc.

A further central feature of Galen's physiology is his theory of innate heat. A flame of life inside the body, innate heat needs air to sustain itself while being tempered continuously by cooler, freshly inhaled air. Some Hippocratics (e.g. *On Fleshes*, 2) and Plato had recognized that bodily heat is essential to life, but for this feature of his physiology Galen seems most indebted to Aristotle. Against those who claimed that the body upon birth acquires heat from without (e.g. Praxagoras, Erasistratus), Galen endorsed the view of Aristotle and the Pneumatists, arguing that we are born with this natural heat, which is the first instrument of the soul. He further agreed with Aristotle that the innate heat is purest and most intense in the heart, and he added that the arteries distribute heat (along with blood and *pneuma* (breath), as Herophilus had claimed) throughout the body.

From Herophilus, Galen also took over the distinction between sensory and motor nerves, and from Erasistratus – against whom Galen wrote more than one fiercely polemical treatise – the influential distinction between "psychic *pneuma*" (in the nerves) and "vital *pneuma*" (in the arteries). According to Galen, the spongy flesh of the lungs acts upon the air we inhale, converting it into a subtler product, *pneuma*. This refined breath passes through very fine "pores" into branches of the pulmonary vein (or "venous artery", in Galen's conception) and thence is "attracted", with blood, by the attractive faculty into the left ventricle of the heart, where it encounters more hot blood and becomes metamorphosed into life-giving, i.e. "vital" *pneuma*. When this cardiac ventricle contracts, blood charged with vital *pneuma* is "attracted" into the aorta and thence into the entire arterial network. After the carotid arteries have distributed vital *pneuma* to the brain, the brain transforms it into "psychic *pneuma*", in part by using air drawn into the cerebral ventricles by way of the nostrils and channels extended into the olfactory bulbs. From the brain psychic *pneuma* – subdivided into sensory and kinetic *pneuma* – flows through imperceptible ducts inside the sensory and motor nerves, enabling sensation and voluntary muscle movements. Medieval Galenists described a third kind of *pneuma*: "natural *pneuma*" produced in the liver, transported through the veins, and functioning as the instrument of the "vegetative" soul. In the vast corpus of Galen's extant texts there is, however, only a single, hypothetical allusion to "natural pneuma" (*Method of Healing*, 12. 5).

Perhaps nowhere is Galen's commitment to teleology expressed more emphatically than in his discussion of reproduction in his major physiological treatise *On the Usefulness of the Parts* (books 14–15), in which he once again fuses the views of many predecessors, even as he criticizes them. With "astonishing skill" Nature has done all she could to make her mortal work – the human body – immortal through reproduction, endowing humans with perfect anatomical instruments for conception, a faculty joined to these instruments to produce pleasure, and a "vegetative soul" that has an irrepressible desire to use the instruments of conception. Being essential to human reproduction, gender-specific anatomical features display Nature's amazing providence: the uterus is bicameral, its hotter right chamber being for the conception and gestation of males, and the colder left chamber for female offspring. To traditional polarities used at least since the Presocratics and Hippocratics to distinguish between female and male – left–right, colder–hotter, weaker–stronger, less perfect and more perfect – Galen added the influential polarity introverted–extroverted: because the female foetus develops in the colder left womb, her generative parts remain inside her body, whereas the male, developing more fully in the hotter right uterus, has extroverted reproductive parts. In support of these in part archaic polarities Galen mustered the formidable weaponry of his meticulous dissections, of his elaborate physiological system, and of his all-encompassing teleology, thereby rendering the old anatomy and physiology scientifically rejuvenated.

Many currents of pre-Galenic anatomy and physiology thus were appropriated and selectively transformed by Galen into an authoritative new medical system which, by and large, was not superseded in Europe and the Near East until the early modern period. Byzantine writers excerpted, paraphrased, and adapted his works on anatomy and physiology, while scholars in Baghdad translated them into Syriac and Arabic, especially in the 9th century, thus ensuring that Galen's views became the almost undisputed norm until systematic human dissection was resumed in the early Renaissance.

Anaxagoras *c.*500–428 BC

Philosopher

Anaxagoras was born in the Ionian city of Clazomenae. After establishing himself as a philosopher there, perhaps by giving lectures or classes, he seems to have come to the attention of Themistocles, who invited him to Athens, where he lived from some time after 470 BC until he was exiled in the late 430s BC. His expulsion was due partly to his friendship with Pericles, and partly to his scientific views, which took no account of the traditional gods in explaining the nature of the heavens. He spent his last few years in Lampsacus.

Although several works are ascribed to him, he probably wrote only one, but it may well have undergone revisions during the course of his stay in Athens. The fame of this book was guaranteed by the reference to it in Plato's *Apology*, where Socrates says that it can be bought in the Agora for a drachma. Elsewhere in Plato's dialogues, most notably in the *Phaedo*, Socrates says that he was disappointed when he read it because Anaxagoras explains everything, including the nature of man, with a reference to what today we would call its chemical make-up, which in turn is governed by *nous*. This is the force that first set the universe in motion and which still determines the mechanism of our changing universe, from the large-scale phenomena of the heavens to (borrowing a term from modern physics that derives from the atomists contemporary with Anaxagoras) the subatomic arrangement of every object; *nous* is often translated as "mind" or "intelligence", and reasonably so, given Plato's punning on the "mindlessness" of Anaxagoras' use of this word. As is clear from Socrates' several attempts to distance himself from Anaxagoras, as well as from Aristophanes' broad satire of Socrates in the *Clouds*, Anaxagoras' contemporaries understood his *nous* either as a new divinity to rival Zeus in his stewardship of the heavens or as a mechanistic (and hence atheistic) cosmic principle. Since Anaxagoras thought that *nous* was present only in some things, presumably animals and plants, the true nature of his *nous* lies somewhere between the anthropomorphic (and somewhat unpredictable) Zeus and what we might call the Laws of Nature.

Although it is tempting to think of *nous* as non-corporeal, Anaxagoras' own words of description are merely that it is the "lightest and purest of all things", and is the only thing capable of existing in a pure form, with no admixture of normal matter. As such, it is not only self-ruling, it also rules all else. In the universe as a whole it works largely by setting things into a vortex that separates heavier objects from lighter ones, pushing the former into the centre, much as a whirlpool can drive pebbles into its middle. Thus the "Socrates" in the *Clouds*, in fact an amalgam of several sophists and Presocratics, presents as a new divinity a pot called *dinos* in Greek, which puns on Zeus/Dios and *dine*, the vortex responsible for the formation of all the heavenly bodies in Anaxagoras' theory.

Just as the vortex stirs things up so that like objects have the opportunity to unite with each other, so too does the breakdown of food during digestion allow like to join with like. (The attraction of like to like was a common belief raised to a scientific principle by many Presocratics.) Anaxagoras, that is, thought that the building blocks of animals (blood, flesh, bone, hair, etc.) were contained within the food they consumed, for, as he says, "how could hair come from not-hair and flesh from not-flesh?"

Much of the first part of his book was devoted to explaining the microscopic nature of matter. Since nothing can come from nothing, there must be some basic unchanging material. And since visible matter takes many forms, few if any of which are permanent, this bedrock of matter must itself come in different, but at this level unchanging, forms, which Anaxagoras metaphorically called "seeds". Thus far, Anaxagoras may be compared to the first atomists Leucippus and Democritus; but his explanation of seeds differed markedly from their atoms. Each seed is indestructible, with fixed shape, colour, and savour. Also fixed is the ration of *dynameis* (roughly "powers" or "qualities") contained within each seed, which tend to exist in polar pairs. These *dynameis* are of an unknown number, but the chief ones named by Anaxagoras are hot/cold, dark/light, heavy/light, and moist/dry. Since each seed contains a fixed amount of *dynameis*, its nature is determined by the combination of the various ratios. Thus, a stone has more heavy than light (both imagined to exist in the same seed simultaneously) and more dry than moist. The facts of nutrition can accordingly be explained by, for example, bread's containing seeds too small to be seen of flesh, bone, hair, etc. The scientific principle at work here – of comprehending the unseen by means of appearances – was expressed by Anaxagoras himself in the form "phenomena are a view of the unseen".

Since, roughly speaking, any object in the cosmos is a mixture just as is the cosmos itself, and since one thing (that is, an object characterized by a certain ratio of qualities) can break down and "become" another, Anaxagoras also deduced that "everything is in everything". For these and similarly scientific attempts to explain matter, change, and causation, Anaxagoras was compared by Aristotle to a sober man among stammerers. He and Democritus were credited by Aristotle and others with elegant and comprehensive theories that could explain both large- and small-scale phenomena.

DAVID SIDER

Biography

Born in Clazomenae *c.*500 BC, Anaxagoras moved to Athens after 470 and remained there until exiled in the 430s. He died in Lampsacus in 428 BC. He wrote (probably) just one book, of which substantial fragments are preserved by Simplicius. It is largely concerned with the nature of matter, which he sees as being governed by a promordial *nous*.

Anaximander

Philosopher of the 6th century BC

Anaximander of Miletus was active in the first half of the 6th century BC (the date of his death is given by Diogenes Laertius as 547/46 BC). He was said to have been a pupil and kinsman of Thales of Miletus, and is included by ancient historians of philosophy among the group of early thinkers who tried to explain the world on the basis of a single material substance. No work of his survives. For our knowledge of his ideas we rely entirely on reports given by later writers from Aristotle onwards; most of the available information comes from authors writing in the 1st century AD or later, and in these cases it is likely that they are relying on general histories of philosophy and encyclopaedias that go back ultimately to the work of Aristotle's successors (especially Theophrastus).

According to Anaximander, the originative substance was the *apeiron*, a term whose precise meaning is not entirely clear; it might mean either infinite or indeterminate, though since Anaximander believed that his originative substance had both of these qualities the uncertainty does not affect the interpretation of his ideas. The creation of the cosmos came about by the separating out of the opposites from the *apeiron*, in such a way as to achieve an overall balance; the details of this process are obscured by the tendency of our sources to assimilate Anaximander's system to one of the cosmological views of their own time (so making the *apeiron* a mixture or an intermediate substance). The *apeiron* surrounds and controls the cosmos, and is eternal, unageing, and perhaps divine. Anaximander apparently produced something like a complete cosmology. He believed that the earth was cylindrical, its depth a third of its width, and that it was supported by nothing, but stayed where it was because it was equidistant from everything else. The heavenly bodies, he believed, were rings of fire, enclosed except at points where there were holes through which the fire showed through. He claimed that the ring of the sun was 27 times, and the ring of the moon 18 times, the size of the earth. Eclipses were caused when the holes were blocked up (though we are not told what causes the holes to get blocked up). He explained rain as arising from moisture that evaporates under the influence of the sun, and thunder as the wind, enclosed within clouds, breaking out. He seems to have believed also that the earth was drying out (perhaps impressed by the receding coastline in Ionia). Reports of his views on the origins of life are intriguing, though enigmatic. He apparently believed that life originated in moisture, and that the first creatures came into being enclosed in a bark-like shell, which they subsequently shed. In the case of human beings, he argued that, since the human infant is incapable of looking after itself for some years, the first people must have come to maturity under the protection of some other creature; they grew to puberty, he claimed, within fish-like animals, from which they emerged in adulthood when they were old enough to be self-sufficient.

It is, however, his production of the first known Greek map that most interests the ancient sources. Maps had, of course, been known to the ancient societies of Mesopotamia for centuries, and it is not surprising that it was in a trading city like Miletus that the concept was first introduced to Greece. There is another intriguing report that Anaximander invented the gnomon (a kind of simple sundial), which he used to mark solstices and equinoxes, and that he set one up in Sparta. He did not invent the gnomon, in fact, because it already had a long history (indeed, Herodotus attributes its invention to the Babylonians), and this may be another case of Anaximander's introducing foreign ideas to Greece. He was the first known Greek to attempt to produce a complete, comprehensive, and rational account of the world and its development, including the early history of the human race.

Anaximander is also the first recorded writer of Greek prose. He is said to have written a number of books, and an account of his cosmology given by Simplicius (writing in the 6th century AD) in his commentary on Aristotle's *Physics* (24. 13) may contain a quotation from one of them: "that from which existing things have their coming-into-being is also that into which they are destroyed according to necessity; for they pay penalty and retribution to one another for their injustice, according to the assessment of time" (as he puts it in these rather poetic words). Unfortunately, it is impossible to say for

certain where the quotation begins and where it ends, but it is probable that in this passage is contained the earliest surviving piece of Greek prose.

Biography

Active in the first half of the 6th century BC, Anaximander of Miletus is said to have been a pupil of Thales of Miletus. None of his writings survive; but we learn from later writers that he tried to account for the world on the basis of a single material substance which he called the *apeiron* (the infinite or indeterminate). He also was the first known Greek to draw a map. He died *c.*547 BC.

Ancestor Worship

The tendency has been noted (Antonaccio, 1995, p. 268; cf. Humphreys and King 1981, p. 267) that, where political power is fluid and personal, the focus, on occasions of death, impels towards the intense interaction of the living; on the other hand, where the base of power is more stable, resting with a historically grounded social group, care of the dead becomes the focus. There is evidence of both with the Greeks, reflecting the belief in the power of the dead over the living and the inconstancy of political structures.

Mycenaean burial sites, where the norm was collective burial in chamber tombs or tholoi, suggest that certain tombs were singled out for special treatment, but that the dead were not worshipped. The evidence indicates instead that veneration of the deceased was not practised, since tombs were often re-entered, and earlier relics and grave goods swept aside or removed. Those ancestors who drew continued interest and with whom claims of connection were maintained were usually claimed as "heroes" and their personal histories and the status or power ascribed to them after death tended to be reinterpreted according to the needs of the descendants. There is no consistency in the accounts of the births, lives, or ends of these glorified ancestors (heroes sometimes disappear rather than die), but they were believed to have lived mortal, if extraordinary, lives.

Conviction held that ancestors reigned over present events. Patrons and guardians to their progeny, they could grant success in diverse endeavours or curse them with disaster – barrenness, disease, pestilence, or military failure. Thus the dead were rarely ignored, even where not worshipped. They were remembered, feared, and invoked by the living through prayer, votive dedication, animal (and in some cases even human) sacrifice, and commemorated in poetry, in song, and at athletic events. The variety of "heroic" ancestry grew over time until, by the late Classical period, athletes, founders of colonies, and even ordinary folk came to be "heroized" as supermortal.

Links with the ancestral past tended to be broken on the mainland during the Dark Ages except in the colonies where Homeric tradition was preserved, and later reintroduced to the mainland during the "renaissance" of the late 8th century BC. The close of the Dark Ages was accompanied by a revival of enthusiasm for the past, born partly of the nostalgia for lost ancestral links, but also as a matter of expedience, as heroic personifications were adopted to lend legitimacy and historical grounding and to provide patronage for the newly founded city or polis. Ancestral claims could also be strategically deployed to reinforce the power of an elite now threatened by the emergent polis and the levelling tendencies of democracy. The "ancestral yearning" (Snodgrass, 1971, pp. 195–96) of this period is witnessed in art, literature, and ceremonial ritual. Formal hero cult was intense during this period. Tomb cult, one of its manifestations, is connected to the loss of stability in social structures and the struggle for the control of land during the transition from pastoralism to an agricultural society. Noteworthy ancestry could aid in the project of legitimizing and stabilizing the power of certain families, connecting them with an epoch of excellence and lending authenticity to claims of landownership. Tomb cult offerings, though largely private and unofficial, also provided a personal connection with the ancient inhabitants of a place, securing the protection and the favour of ancestral powers and appeasing the anonymous hostile forces thought to dwell therein. Tomb cult peaked in the 8th century BC and continued into the Classical period.

During the late Iron Age trade and prosperity intensified, creating greater social and cultural complexity. Where the region favoured social interaction among the elites, claims of ancestry remained a matter of prestige and burial custom stayed competitive. Teams of asses or horses, armour and weaponry, and a variety of luxury imports were buried with the deceased and there is evidence, at the grave site, of intense ceremonial activity among the living. However, as configurations of power tended towards the personal and fluid, claims of archaic ancestry declined, as did extravagance of burial custom once sanctuaries came to be employed as the arena for communal and regional competitions. In the more isolated regions, however, the ancestral claims of older families were probably maintained.

The well-established polis continued the practice of corporate worship of the ancestral spirits. This provided a unity to its worshipping community, though it could also have a divisive effect since it tended to serve the power of the aristocrats. Some tomb cults were ongoing, monuments being claimed by later generations, but generally they were of short duration and limited scope. As political power came to depend on the redistribution of wealth and on the charismatic draw of individuals, kinship claims were no longer the necessary base of power. During this period there is evidence of a continuing concern for the ancestral past. The dead continue to be related to one another, graves being connected by mounds or tumuli and

enclosed within walls for protection against encroachment by expanding settlement.

Scholars generally agree that the antiquity of the Greek clan or extended family (*genos*) over centuries is a myth without foundation (Cavanaugh, 1991, pp. 100, 103; Antonaccio, 1995, pp. 252–53, 264). Even the most prominent families had no extensive pedigree. In Attica there is no evidence of long-term use of a common lot at any time from the Mycaeanean to the Classical period. Nor is there any sign of the continual tending of graves or consistent cult worship. Ancestral links seem to have been maintained over four generations or less, whether oral or written records helped to keep genealogical memory alive.

On the whole, times of instability and social disruption tended to favour a nostalgia for the past, impelling towards reaffirmations of heroic ancestry, renewed family-based claims of political legitimacy, and increased belief in the power of the dead, evidenced by greater care of the burial sites. With increased stability and prosperity, less emphasis was placed upon ancestral heritage, and there was a return to corporate burial. In the latter case, vigorous interaction between the living tended to be the focus rather than care of the dead.

In the early centuries of the Christian era, the Roman empire's contact with the east brought a blaze of interest in Near Eastern, Egyptian, and Oriental mystery religions, eclipsing for a time the glories of its Greek heritage. As Rome began to crumple, eastern influences triumphed over Classical tradition, not so much because of the superior splendour of the oriental, but because its mystical bent was more suited to the needs of the decaying empire. Its secret ritual practices, its pomp and ceremony, but also the sense of discipline and fellowship it promoted, brought consolation to the world-weary spirit in this era of decline. By the 3rd century Mithraism had spread throughout the empire, embracing the bulk of the army. Though the disillusioned were no longer drawn by the pagan insights of the sheer joy of life, characteristic of the Greeks, eastern mystery cults did promote the belief in the continuance of the soul and the cycle of rebirth, which continued the demand for reverence for the ancestors.

Upon the rubble of decaying Rome the emperor Constantine erected a new empire, Byzantium, committed to Christianity. To complete the transformation of the new empire, he established a second capital city, Constantinople, dedicated in AD 330. This site embraced all the elements of the reformed empire – Greek, Roman, and Christian – but, since it was set on the Greek-speaking coasts around an old Greek city, it was the Hellenistic past of the new empire that was highlighted. Constantine did all that he could to promote that historical connection, making the city a centre of education and the arts, stocking its libraries with Greek manuscripts and its museums with Greek treasures, and beautifying its streets and squares with Greek works. An obsession with its Hellenistic past flared throughout the empire. Even in the 12th century aristocrats were said to boast that their ancestors had arrived with Constantine (Runciman, 1933, p. 28).

Every corner of the Western world to some degree or other owes to its Greek heritage a cultural and political debt. During the national revival of the early 19th century, the Greeks, at least within the intelligentsia, bore the consciousness of being the heirs of a heritage universally revered. An obsession with past glories, *progonoplexia* ("ancestor weaving": Clogg, 1992, p. 2), characterized much of the country's cultural life, yielding movements of purification of the language and nostalgia for ancient ideals. Early Greek nationalists looked only to the Classical past for its inspiration, rejecting the glories of the Byzantine era. But in the mid-19th century Konstantinos Paparrigopoulos, a professor of history at the University of Athens, reinterpreted Greek history as a single continuum linking ancient, medieval, and modern periods.

It is central to the historical experience of the Greeks that their "Greekness" was understood, not so much with reference to a specific place, as to a way of being in the world. Due to its wealth of overseas communities, Greece had always included a large population of those who dwelt beyond the mainland, sojourners in foreign lands. This fact must have raised acutely and continuously the question of what constitutes the Greek identity. Language and religion could in no definitive way answer this question. Ancestry is the only inalienable link that accompanies people wherever they may go. This may explain the continued emphasis on ancestral heritage within the Greek world.

Andrew of Crete, St *c.*660–740

Hymnographer and preacher

St Andrew of Crete was one of the most famous Byzantine writers of hymns and homilies. He lived at a period when the Byzantine empire was besieged by Arabs and invaders from the north and when literary production consequently declined. He is perhaps best known for his invention of a new hymnographic form, the canon; whether or not he was really the inventor of this form is disputed by scholars, but his authorship of the best-known example of this genre, *The Great Canon*, is well attested. His homilies, while evidently well loved by contemporary and later medieval audiences, judging by the large number of manuscripts in which they are transmitted, are not suited to modern delivery, being highly rhetorical and employing a fairly recherché vocabulary.

According to an anonymous, but probably early, *Life* written by one Niketas, Patrician and Quaestor, Andrew of Crete was born around 660 in Damascus, Syria. Judging by his own writings, which display a secure command of Attic Greek and the late antique rules of rhetoric, he received a good education in the schools of the Arab-ruled Near East. At the age of fourteen or fifteen he was received as a monastic novice at the church of the Resurrection in Jerusalem. In 685 Andrew was sent to Constantinople in order to convey the agreement of the patriarchate of Jerusalem to the acts of the Sixth Ecumenical Council, held in 680–81. He remained in the imperial city, serving first as a deacon in the Great Church and later as the head of an orphanage and an almshouse in the city. The exact date of his ordination as archbishop of Crete is unknown, owing to the lack of literary sources for the period. However, the ordination must have taken place between 692, when a metropolitan of Gortyn named Basil signed the Acts of the Council in Trullo, and 711, when Andrew, in that capacity himself, signed the decree of a conciliabule ordered by Philippikos Bardanes that temporarily overturned the decisions of the Sixth Ecumenical Council and restored Monothelite doctrine. It is generally assumed, although difficult to prove, that most of Andrew's hymns and homilies were composed when he was serving as archbishop of Crete. A few of the homilies may be dated precisely on the basis of internal evidence, but the majority provide no clues concerning the circumstances of their delivery. It is clear from a few references in the homilies that Andrew lived well into the first period of iconoclasm (730–787) and the date of his death can therefore be placed in 740. Since he refers only rarely to the theological dispute over holy images, however, it can be inferred that he did not play an active part in the controversy. His authorship of a fragment of a text in defence of icons has been disputed, but he does deplore the imperial stance against images in his homily *In Circumcisionem et in S. Basilium* (*Clavis Patrum Graecorum* 8175). Andrew died on the island of Lesbos on his return journey to Crete after a visit to Constantinople, where he had sought imperial aid for his Cretan flock, which had been devastated not only by the Arab invasions but also by plague and famine. He was buried in the church of the holy martyr Anastasia.

Fifty-eight homilies have been attributed to Andrew, but a number of these, which remain unedited, may in fact belong to other authors. It is likely that between 30 and 35 homilies will prove to be his, but all of these texts await detailed stylistic and theological analysis. Most of Andrew's homilies are festal; that is, they belong to a genre that was intended for formal delivery in the context of the liturgical celebrations for particular feast days. Cycles of three or four sermons in honour of the Theotokos, or Mary the "God-bearer", survive that were probably preached in succession during the all-night vigils that preceded her feasts. These homilies reveal the strong influence of earlier marian literature, including especially the *Akathistos* Hymn. Repetitive and highly poetic in style, they celebrate the Virgin with typological and other theological images. Several homilies were written in honour of dominical feasts, including the Raising of Lazarus, Palm Sunday, and the Transfiguration, and a number of panegyrical sermons also survive, honouring both local Cretan saints and martyrs and more universal heroes such as St George and St Nicholas. It should be noted, however, that Andrew's authorship of the last works has been called into question by scholars. The two panegyrics on St

George differ so much in their accounts of the saint's ordeals and martyrdom that it is likely that they were based on two different sources. The encomium on St Nicholas, although transmitted in many manuscripts that attribute the text to Andrew, depends largely on a text that may have been written in the 9th century (cf. Anrich, 1917, pp. 346–56). All of these encomia, as well as an account of the miracles of St Therapon, await detailed analysis before they can be attributed securely to Andrew of Crete. The literary influences on Andrew's homilies lie both in hymnography and in homiletics. His choice of images and poetic word play sometimes echoes those of Romanos the Melodist, a hymnographer of the 6th century, while his prose style reflects most closely that of Gregory of Nazianzus.

The surviving hymns of Andrew of Crete, like his homilies, await detailed study. His Great Canon, which is sung during the fifth week of Lent, is extremely long, with 250 strophes. What is chiefly striking about this hymn is its penitential and personal tone. Andrew speaks in the first person but also on behalf of every Christian, both repenting of his sins and seeking God's forgiveness. He also wrote canons in honour of feasts including the Birth of the Virgin Mary, the Conception of St Anna, her mother, and the Raising of Lazarus. A number of hymns still await critical editions, and for all of them a detailed literary and musical analysis would be desirable. As one of the first, if not the first, writers of canons, Andrew introduced into Greek theological literature a penitential, at times mystical, tone that had previously been absent. Both his hymns and his homilies influenced subsequent hymnographers and preachers in Byzantium. The inclusion of Andrew's homilies in liturgical collections, in which they featured as readings for individual feast days, and the use of his canons in the service of *orthros* (matins), allowed these works to serve as literary models until the end of the Byzantine period.

Andronikos I Komnenos *c.*1118/20–1185

Emperor

Andronikos I Komnenos (1183–85) was one of the most controversial personalities on the Byzantine throne. The son of Isaac Komnenos and Eirene, and thus the nephew of Emperor John II Komnenos (1118–43), he grew up with Manuel I Komnenos (1143–80). The two cousins had some characteristics in common, such as chivalrous audacity and lasciviousness, but the desire they shared for exclusive leadership made them rivals. Manuel sought in vain to integrate Andronikos into the power network that the imperial family had built up with other aristocratic clans. Highly talented and able to impress and fascinate both men and women alike, Andronikos handled the tasks entrusted to him carelessly. He even conspired against the emperor, was imprisoned, and twice managed to escape. During a decade (*c.*1167–79) of exile in the Arab world, Georgia, and the crusader states he acquired a critical attitude to his country's situation. Although he was not xenophobic himself, he was unscrupulous in his exploitation of anti-Latin resentment, and in 1182 tolerated a massacre at Constantinople in order to take over the regency for the minor Alexios II, whom he suppressed and killed within a year.

In foreign policy the costly, but hardly effective, support of the crusader states was now definitely abandoned. An understanding was reached between Byzantium and the Muslim sultan Saladin concerning their respective spheres of influence in Asia Minor, Syria, and Palestine. The political programme of Andronikos was mainly oriented towards internal affairs in order to regain absolute control: too much power had shifted to the regional magnates, who managed the adminstrative apparatus in the provinces at will. Harsh measures against the salvage of cargo or the exploitation of peasants, for example, were not intended to favour special groups or social strata, but were aimed at creating an efficient and uncorrupt bureaucracy. The old ruling class, seeing its positions endangered, either impeded the imperial reforms or even rose in revolt, which Andronikos and his collaborators (many of them unqualified newcomers) suppressed with cruelty. Increasingly noblemen fell victim to a reign of terror on mere suspicion or denunciation of disloyalty.

Neighbouring countries such as Hungary tried to profit from the unstable situation and, incited by refugees, invaded Byzantine territories, but they were driven back. We may assume that Andronikos would have also succeeded in beating off an unexpected Norman attack from Italy. After the loss of Thessalonica (August 1185) the Byzantine army had already split up the invaders and slowed down their advance eastwards. Nevertheless tension and fear prevailed in the capital, which was inflamed when the mediocre aristocrat Isaac Angelos, stricken with panic, killed an imperial official who had come to arrest him. Seeking asylum in Hagia Sophia, Isaac unwillingly became the champion of a popular uprising and was crowned emperor on 12 September 1185. Andronikos fled, was imprisoned, mutilated, and finally butchered by the mob. His death brought to an end the drastic and often inhuman measures intended to restructure a state in economic and political decline. Two decades later, in 1204,

Constantinople and nearly the whole empire fell an easy prey to the so-called Fourth Crusade.

Biography

Born *c.*1118/20, Andronikos fought his way to the Byzantine throne in 1183, but was himself murdered two years later in Constantinople. He was the last ruler of the Komnenian dynasty, with a brilliant mind, but a lascivious temper. He inaugurated reforms against corruption and to strengthen the central power against regional magnates, but their resistance caused a reign of terror which culminated in the emperor's murder.

Andronikos II Palaiologos 1259 or 1260–1328

Emperor

The long reign of Andronikos II Palaiologos (1282–1328) was marked by the beginning of the Ottoman advance in Asia Minor, religious dissensions, and a civil war, but it also witnessed the last efflorescence of Byzantine art and culture. Born in 1259 or 1260, Andronikos was proclaimed co-emperor in 1274 by his father Michael VIII Palaiologos (1259–82), who wished to ensure a smooth transition of power and to strengthen the position of the Palaiologan dynasty, which had ousted the Laskarids of Nicaea in 1261. Andronikos II had, however, a personality and a political credo very different from those of his father. Michael VIII had ruled the empire with an iron hand, subordinating through the Union of Lyons (1274) the Byzantine Church to the papacy in order to ward off western ambitions for the reconquest of Constantinople. Immediately after his accession, Andronikos II Palaiologos repudiated the unpopular Union of Lyons and restored Orthodoxy. Another internal split within the Byzantine Church, the "Arsenite schism", was not healed until 1310. The Arsenites were followers of the patriarch Arsenios (1255–60 and 1261–67), who had supported the dynastic claims of the Laskarid dynasty and of its last representative, the child-emperor John IV Laskaris (1258–61) who had been blinded by Michael VIII's order. The end of the Arsenite schism was also a belated recognition of the legitimacy of the Palaiologan dynasty.

Andronikos II Palaiologos was a devout and staunchly Orthodox emperor. During his rule the influence of the Church in late Byzantine society grew steadily. He included churchmen as judges in the supreme imperial court as reformed in 1296 (the so-called "General Judges of the Romaioi"). In 1312 he transferred the administration of the monasteries of Mount Athos from his own jurisdiction to that of the patriarch. The episcopal dioceses and their order of precedence were also reorganized during his reign. The strong-willed patriarch Athanasios I (1289– 93 and 1303–11), writer of numerous letters and sermons, protected the poor inhabitants of Constantinople from the abuses of merchants and imperial officials, and took to heart the plight of the Greek refugees from the Turkish advance in Asia Minor in the early years of the 14th century. Under his guidance, in 1304 the synod issued a new law, which was confirmed by the emperor in 1306; it covered such topics as inheritance, the opening hours of taverns and bath houses, prostitution, adultery, etc.

The Turkish expansion in Asia Minor became the nemesis of the Byzantines during the reign of Andronikos II. Michael VIII Palaiologos had withdrawn troops from the empire's eastern frontier, which now collapsed under the pressure of successive waves of Turkoman tribes fleeing the Mongol menace. Unlike Michael VIII, who had been preoccupied with the Latin west, however, Andronikos II made efforts to remedy the situation by personally leading an army in Asia Minor; and, for a short time in 1294, the campaigns of the great general Alexios Philanthropenos raised hopes. But he was opposed by powerful landlords in the area, pushed into an unsuccessful rebellion, and his successes were short-lived. Asia Minor rapidly fell to the Turks after the Byzantine defeat at the battle of Bapheus near Nikomedeia (1302) by the forces of Osman, the eponymous founder of the Ottoman state. The Ottomans took Bursa in 1326 and made it their capital. Further south, in the first decade of the 14th century, Ephesus, Smyrna, Miletus, and Sardis fell to the Seljuk emirates. In an unsuccessful effort to turn the tide of Turkish conquests, in 1303 Andronikos II hired a group of undisciplined Catalan mercenaries. After an initial success in the capture of Philadelphia in 1304, the so-called Grand Catalan Company turned against its Byzantine masters, laying waste Thrace and Mount Athos and settling first in the Cassandra peninsula and later in Thessaly. In 1311 the Catalans moved further south to Attica, expelled the ruling Frankish lords, and founded the Catalan principality of Athens and Thebes (1311–88).

Another source of trouble for Andronikos was the aggressive plans for the revival of the Latin kingdom of

Constantinople led in the early 14th century by Charles of Valois, brother of the French king Philip IV the Fair (1285–1314) and husband of the heiress to the Latin kingdom, Catherine de Courtenay. Fortunately for Andronikos, in 1314 Charles of Valois gave up his intentions, which had found support even among some Byzantine aristocrats. The reign of Andronikos II also saw the beginning of the Serbian expansion, which would culminate in the great conquests of Stephan IV Dushan (1331–55). In 1282 the Serbs occupied Byzantine-held northern Macedonia, capturing the strategic city of Skopje. Andronikos had to acknowledge the Serbian conquests; in 1299 the Serbian king Stephan II Milutin (1282–1321) married his five-year-old daughter Simonis and received as a dowry the lands north of the Ochrida–Prilep–Shtip line in Macedonia.

The internal collapse of the late Byzantine state began in the last years of Andronikos II's reign, when a civil war broke out between the ageing emperor and his grandson Andronikos III (1321/28–41). Having started as a private quarrel provoked by the emperor's decision in 1321 to exclude his grandson from the succession, the civil war became an outlet for social tensions and dragged on intermittently for seven years. High taxation and official corruption had plagued Andronikos II's reign. The younger Andronikos tried to lure aristocratic supporters through lavish tax exemptions, which in the long run damaged the imperial fisc and led to the devaluation of the Byzantine golden coin (*hyperpyron*). In 1328 the young Andronikos finally managed to oust his grandfather without any bloodshed, and Andronikos II was confined to the imperial palace. Two years later the supporters of Andronikos III forced the old emperor to enter a monastery, where he died on 13 February 1332.

The reign of Andronikos II saw not only troubling political developments, but also some remarkable cultural achievements. The philologists Maximos Planudes, Thomas Magister, and Manuel Moschopoulos commented on and systematized works of Classical authors. The numerous Byzantine intellectuals and literati of the period were associated, in one way or another, with the court of Andronikos II. Two of the greatest Byzantine encyclopedic scholars, Nikephoros Choumnos (died 1327) and Theodore Metochites (1270–1332), served in the imperial administration and rose to the rank of *mesazon*, or prime minister. Both were of relatively modest social origin but managed to connect their families with the ruling Palaiologan dynasty through marriage. Theodore Metochites became notorious for his corruption and was sacked by the young Andronikos III in 1328. Nikephoros Choumnos, Theodore Metochites, and Nikephoros Gregoras all composed panegyrics in honour of Andronikos II.

DIMITER G. ANGELOV

See also Renaissance (Palaiologan)

Biography

Born in 1259 or 1260, Andronikos II reigned for 46 years from 1282 to 1328. He died a monk in Constantinople in 1332. His reign was marred by Ottoman advances in Asia Minor, by religious controversy, and by civil war. It also witnessed the final flourishing of Byzantine art and culture, the so-called Palaiologan Renaissance. Andronikos was deposed in 1328 by the supporters of his grandson Andronikos III.

Andronikos, Manolis 1919–1992

Archaeologist

Manolis Andronikos was one of the foremost Greek archaeologists of the 20th century, well known for his devotion to, and promotion of, archaeological investigation in Macedonia. He was born in Prousa (Bursa) of a Samian family, which moved to Thessalonica in 1922 as part of the population exchange with the Turks. This family history may have influenced his subsequent career.

Thessalonica remained the centre of his life, except for a short period of time which he spent at Oxford University on a scholarship, studying under the direction of Sir John Beazley, a well-known British scholar of Greek archaeology. Upon his return to Greece, Andronikos joined the ranks of the Greek Archaeological Service, and began a teaching career at the Aristotelian University of Thessalonica. He was very active in the field, excavating sites in Macedonia and Chalcidice, including Verroia, Naousa, Kilkis, Dion, and Thessalonica. One of his early publications, *Vergina*, vol. 1: *To Necrotapheion Ton Tymvon* [The Tymbon Cemetery], summarizing his excavation work on Iron Age graves in the vicinity of Vergina, made a fundamental contribution to our understanding of Iron Age chronology in central Macedonia.

Andronikos first began excavating in the Hellenistic palace at Vergina under the direction of K.A. Rhomaios in the 1930s. He remained especially devoted to the area and the site, and with George Bakalakis later resumed and expanded the excavations at the Hellenistic palace. The tumulus at Vergina also fascinated Andronikos, but the mound was too expensive to excavate and the foreign schools of archaeology were uninterested in such a project at that time. It was not until he received the support of Constantine Karamanlis, prime minister of Greece and a Macedonian by birth, that his goal was realized. Work at Vergina began in 1976, and a year later he announced that he had discovered a *heroon* (hero shrine), an unlooted 4th-century BC chamber tomb, and an unusually large cist tomb, which had already been stripped of its contents but was still decorated with magnificent wall paintings. Andronikos claimed that the chamber tomb contained the burials of King Philip II of Macedon, father of Alexander the Great, and his wife.

At the time of his discovery he maintained that the archaeological evidence confirmed the site of Vergina as ancient Aegae – the Macedonian royal burial ground and early capital. This evidence consisted of lavishly appointed tombs with

Manolis Andronikos among the ruins of Vergina, which he excavated

splendid wall paintings, clearly dated to the second half of the 4th century BC. The skeletal remains, wrapped in purple, and individual items found in the main chamber and antechamber of the chamber tomb, such as a gold *larnax* (or casket), the lid of which was decorated with the Macedonian star, and elaborate armour, also appeared to support a royal identification. Andronikos found a second chamber in 1978, also unlooted, which he considered to belong to Alexander IV, the son of Alexander the Great and the Bactrian princess Roxane. While most scholars agree with the latter designation, the identification of the remains in the first chamber tomb is still debated. In 1987 he uncovered the tomb of Eurydice, the mother of Philip, which is the earliest and the largest of the Macedonian tombs, containing a magnificent marble throne covered with painted and relief decorations. These finds stimulated great interest and controversy in the field of Greek archaeology, focusing the attention of the Greeks and the rest of the world on Macedonia, and gave new impetus to archaeological excavation in the area.

Andronikos directed excavations at the site of Vergina, revealing the city plan, including a theatre, an agora, the circuit walls, and the acropolis. The seminal publication of his work there, *Vergina: The Royal Tombs and the Ancient City*, appeared in 1984. He also discovered and excavated a number of 4th-century BC tombs at the nearby village of Palatitsa. His frequent, dramatic lecture presentations and the publication of numerous monographs and articles continued to focus attention on Vergina and the archaeology of the region even after the excitement and controversy of his initial discoveries had died down.

As a result of his efforts on behalf of Macedonian archaeology Andronikos gained worldwide renown. He was the recipient of many international professional honours, notably the Hergen award in Austria, and was affiliated with a number of foreign institutions and archaeological schools in Greece, such as the German Archaeological Institute. In addition, he was given the Grand Phoenix Cross, the highest civilian award bestowed by the Greek government.

Andronikos's international prominence benefited Macedonian archaeology by focusing the attention of the world on that region, and maintaining a high level of interest in subsequent work. Excavations continue in a number of locations, including the palaces at Vergina and Pella, and urban sites such as Dion, the religious capital of Macedonia, and Amphipolis, an Athenian colony established in 437 BC. In addition, cemeteries containing burials of the common people have yielded a wealth of information about culture and funerary customs in the Archaic and early Classical periods. His finds at Vergina made new and important contributions to the understanding of 4th-century art and architecture, particularly in the

areas of work in precious metals, tomb architecture, and painting. Andronikos in the course of his career trained a new generation of Greek archaeologists to carry on his work, not only to conduct in-depth research and publication of some of his finds, but to continue excavation work in the area, maintaining the hard-won attention of the community of scholars working in the field of Greek archaeology. Perhaps most important of all for the Greek people, he assumed the role of a national hero as his countrymen used the finds from his excavations as evidence that there were strong ethnic and cultural ties between the ancient Macedonians and the Greek city states to the south, promoting the idea that the Macedonians were above all a Greek tribe.

Angelopoulos, Thodoros 1935–

Director, scriptwriter, producer, and critic

Theo Angelopoulos is the most celebrated contemporary film maker working in Greece and a film stylist of striking originality who makes frequent use of extended long shots in his work. His *Aioniotita kai Mia Mera* (Eternity and a Day) won the Palme d'Or at the Cannes Film Festival in 1998, while *Ulysses' Gaze*, starring Harvey Keitel, was winner of the 1995 Festival's Grand Prize. A major Angelopoulos retrospective took place at the Museum of Modern Art in New York in 1990 and, more recently, a special Angelopoulos season was held at the Riverside Studios in London (1998).

Angelopoulos was born in Athens on 27 April 1935 and studied law at the University of Athens (1953–57). After finishing his military service he left for Paris where he enrolled at the Sorbonne, attending lectures by the anthropologist Claude Lévi-Strauss. He also studied at the Institut des Hautes Etudes Cinématographiques, although he left the IDHEC, ostensibly because of disagreements with the staff, and found a mentor in Jean Rouch, the ethnographer and director, at the Musée de l'Homme. In 1964 Angelopoulos returned to Athens were he worked as a film critic for the left-wing newspaper *Dimokratiki Allayi* and for *Synchronos Kinimatographos*, the first serious Greek film magazine, which was founded in 1969 as a Greek equivalent to the influential French film journal, *Cahiers du Cinéma*.

Angelopoulos's first film was a black-and-white short of 23 minutes entitled *The Broadcast* (1968), which won the Critics' Prize at the Thessalonica Film Festival. This was made in collaboration with the cinematographer Yorgos Arvanitis and initiated a long and successful partnership. In total, Angelopoulos has made 11 features. *Anaparastasi* (Reconstruction, 1970), his first feature film, was made during the Colonels' regime and won the coveted Prix Georges Sadoul (1971). It is generally regarded, together with *Evdokia* (1971) by Alexis Damianos (1919–), as inaugurating the New Greek Cinema. Shot on a low budget and using non-professional actors, *Anaparastasi* stands out conspicuously from the mainstream commercial cinema of the 1960s which was dominated by light comedy and melodramas that pandered to the audience's desires for social mobility. On one level it tells the story of the death of the village in late 20th-century Greece and explores the break-up of a traditional rural community under the pressures of urbanization. The action, which is based on a true incident reported in the Greek newspapers, takes place in a mountain village in Epirus where Kostas Gousis (Michalis Photopoulos) returns after years spent in Germany as a guest worker. On his homecoming he is murdered by his wife Eleni (Toula Stathopoulou) with the help of her lover, Christos Grikakas (Yannis Totsikas). The dark, brooding landscape of northern Greece anticipates Angelopoulos's subsequent films which, for the most part, evoke a dilapidated provincial Greece of crumbling façades, far removed from the clichés of sunny Attica. The unity of place in *Anaparastasi* is juxtaposed with disconcerting chronological leaps since the film focuses on the attempts by the police to reconstruct the scene of the crime. Angelopoulos himself plays a cameo role as an investigative journalist. While there are strong documentary aspects to the film, *Anaparastasi* foreshadows many of the technical strategies and thematic preoccupations of Angelopoulos's later work.

The motif of the journey, for example, runs through all of Angelopoulos's films from *Anaparastasi* to *Aioniotita kai Mia Mera* which describes the wanderings of an elderly writer, Alexandros (Bruno Ganz), through Greece. Similarly, the theme of the journey figures strongly in *O Thiasos* (The Thiasus, 1975, distributed in the UK as The Travelling Players), in *Taxidi sta Kythira* (Voyage to Cythera, 1984), where the old communist Spyros (Manos Katrakis) returns to Greece from exile in the Soviet Union, and in *O Melissokomos* (The Beekeeper, 1986), where the middle-aged schoolteacher

(Marcello Mastroianni) leaves his wife and job to follow the pollen route. Finally, the two children Voula (Tania Palaiologou) and Alexandros (Michalis Zeke) in *Topio stin Omichli* (Landscape in the Mist, 1988) voyage like Telemachus in search of their lost father whom they have never known and who may be a figment of their imaginations.

In *Anaparastasi* notions of homecoming are frequently bound up with a mythic structure; Kostas Gousis's repatriation is linked to Aeschylus' *Oresteia*, and more particularly to Clytemnestra's murder of Agamemnon. In other films, such as *O Thiasos*, the actors bear the names of protagonists in the *Oresteia* cycle and perhaps most obviously, in *Ulysses' Gaze*, the peripatetic film maker is dramatized as a Homeric hero in search of his lost homeland. Angelopoulos's work is pervaded with allusions, both visual and verbal, to Classical Greece, and echoes from the work of Angelopoulos's favourite poet George Seferis, notably from the sequence *Mythistorema* (1935), recur in the films.

Much of Angelopoulos's work is concerned with history and the director has designated a collection of his early films the "Historical Trilogy"; this includes *Meres tou '36* (Days of '36, 1970), *O Thiasos*, and *I Kynigoi* (The Hunters, 1977), three films which did much to establish the director's international stature. The first is set around the time of the Metaxas dictatorship and focuses on a political prisoner called Sofianos (Kostas Pavlou) who holds a politician hostage, with dire consequences. The second, which was made shortly before the fall of the military Junta, is a four-hour film that explores the conflicts of the Civil War as seen through the eyes of a troupe of actors whose performances are continually and tragically interrupted. This is undoubtedly one of Angelopoulos's most ambitious films which moves chronologically from the 1930s to the 1950s, encompassing the Metaxas dictatorship, the Italian invasion of Greece, the German occupation, and the Nazi defeat. The final film in the trilogy, *I Kynigoi*, begins in the 1970s with the discovery by hunters of the body of a partisan killed in 1949.

While Angelopoulos's films engage with the turbulence of Greek history and explore real historical moments, on another level they probe the meanings of history itself. As one critic has aptly observed, they should perhaps be regarded as "reflections on history, rather than historical films". As in *I Kynigoi*, they shed light on the ways in which history, embodied in the dead partisan, is continually and unexpectedly resurfacing to trouble the present. Similarly, in *Megalexandros* (1980), the director both celebrates and undermines notions of a grand historical narrative, in a manner that recalls the panoramic sweep of Bernardo Bertolucci's *1900* (1976). The film was shot in a remote village near Grevena in Greek Macedonia and, like Bertolucci's film, takes place in 1900. It relates the story of a heroic Greek bandit (Omero Antonutti) who has ambitions to become a modern Alexander the Great. Escaping from prison with a band of his followers, the bandit kidnaps a group of Englishmen and women and seizes a village in northern Greece which has established an egalitarian way of life based on the abolition of property and the equality of rights. The narrative charts the destruction of the Utopian community, however, as the hostages are murdered and Alexander changes from a hero into a ruthless tyrant. Eventually he is murdered by the villagers and the village itself is secured by government forces.

Following the so-called "trilogy of silence" which included *Taxidi sta Kythira*, *O Melissokomos*, and *Topio stin Omichli*, Angelopoulos produced two films which reflect upon the significance of borders and identity. In *To Meteoro Vima tou Pelargou* (The Suspended Step of the Stork, 1991) a young TV journalist (Gregory Karr) attempts to unearth the secret of a politician's (Marcello Mastroianni) disappearance on the Greek-Albanian border, while the narrative of *Ulysses' Gaze* centres on a film maker's (Keitel) journey to Sarajevo across the borders of a war-torn southeastern Europe in search of three missing reels of the first film footage ever shot in the Balkans. The emotional power of both films is enhanced by Eleni Karaindrou's haunting musical score.

Biography

Born in Athens in 1935, Angelopoulos studied law at the University of Athens and anthropology at the Sorbonne. Returning to Athens in 1964, he became a film critic. He directed his first film, a short, in 1968, and since then he has directed more than a dozen feature films as well as TV work. His films have won numerous awards.

Ani

Capital of medieval Armenia

Ani lies 45 km east of Kars in northeastern Anatolia. Its stunning position, a naturally strategic triangular site with eventually walled sides, each about 2 km long, overlooks a gorge of the Arpa Çay (Ahurean river) which is today the border between Turkey and Armenia, and could not escape early defences. In the 5th century AD the Kamsarakan dynasty held a fortress on the citadel at the southern point. From the 8th to the 10th centuries the area (Armenian Shirak) was in Arab hands, but the Armenian Bagratids made Kars their capital. In 961 Ashot III (952–77) moved his capital from Kars to Ani, initiating immense public works. Under Smbat II (977–89) the cathedral was begun and the outline of the great city walls, punctuated by semicircular towers, was completed. Under

Gagik I (989–1020) the cathedral was completed and Ani became the seat of the *katholikos* (patriarch) of Armenia, whose synod hall and regal sepulchral churches lie around the monastery of Horomos, 15 km north of Ani, on the serpentine border which has both divided and preserved them.

The building boom in cut redstone which lasted at Ani from 961 to the early 11th century also included the construction of cisterns, baths, palaces, caravansarays, and churches – variously put by Armenians at 1001 churches and by Ibn al-Athir at a more credible 500. The most delightful surviving church is St Gregory Abugamrents, a 10th-century cylinder with conical dome. But the architect of the three most striking churches is named by inscription as Trdat, a genius who looked back to varied early Armenian examples. For Smbat II and Katranidze, wife of Gagik I, Trdat built the cathedral (989–1001): a vast domed basilica, the largest upstanding building in Ani, which to Westerners who have not seen St Gayane at Vagharshapat looks Romanesque; the ruined circular church of St Gregory of Gagik (1001) is based on Zvartznotz; and the immense church of the Redeemer, which Trdat built in 1036 for a merchant prince, is an octafoil carrying an inscription of market regulations and a very large dome, which is falling in stages.

Following Basil II's Byzantine expansion into northeastern Anatolia, the Armenian *katholikos* Peter Getadarts surrendered Ani to the Byzantines in 1045, which then served as capital of the short-lived theme of Iberia until it was taken by the Seljuks in 1064. There seems to be no building activity attributable to this period. After the battle of Manzikert in 1071, the Seljuks sold Ani to the Kurdish Shaddadid emirs whence it passed to the Zakarids, but the place remained a strategic and polyglot commercial centre after the arrival of the Mongols of the Ilkhans of Iran. For example, in 1215 a merchant prince, Tigranes Honents, financed a beautiful church overlooking the gorge above the now broken bridge between Turkey and Armenia. Dedicated to St Gregory the Illuminator of Armenia, his miracle cycle was painted by Georgian artists – Greek work has also been claimed. It was only with the Timurid Mongol conquest of the early 15th century that Ani lost its importance. When it was in Russian hands in the 19th century and Turkish in the 20th century, it was examined by many archaeologists, but the border has preserved it for further study.

Summary

Situated in northeast Anatolia, the city of Ani lies on the modern border between Turkey and Armenia. After two centuries of Arab rule, the area became Armenian again and Ashot III (952–77) moved his capital from Kars to Ani. Grand buildings were constructed. From 1045 Ani was the capital of Byzantine Iberia but it was taken by the Seljuks in 1064. Ani lost its importance after the Mongol conquest in the 15th century.

Animals

In Hellenic society animals have been essential with regard to the practicalities of farm work and food production, transport and war, hunting and sacrifice. Yet for the Greeks the cultural significance of animals goes beyond the practical. Greek myth in words and pictures represents real and imagined animals to explore culture, and uses them as conceptual tools. The Greeks not only used animals for practical purposes, they also used animals to think with.

In Greek society, predominantly rural, animal husbandry has always been important and in the late 20th century nearly one-third of the Greek population works in agriculture, although many farm animals are now reared indoors, often by intensive methods. The imagery of farming has informed Greek expression from Homeric epic on, where "towards evening'" is rendered as "the time for unyoking oxen" (*boulytonde*, as in the *Iliad*, 16. 779 and the *Odyssey*, 9. 58), while the early system of writing left to right and back again was described in terms of oxen ploughing (*boustrophedon*). Even the Greek gods were herdsmen (Apollo in the *Homeric Hymn to Hermes*; Helios in the *Odyssey*) and Zeus, Poseidon, and Dionysus have special taurine associations. Sheep and goats were indispensable for their wool as well as their milk and meat (Theocritus' goatherd and shepherd argue about whose fleeces are best, *Idyll* 5) and feature often in the mythic imagination. Pan is the goat god and the song that accompanied the sacrifice of a billy goat (*tragos*) is linked to the development of tragedy, while the shepherd tending his flock is a common literary theme; Polyphemus and Paris on Ida are early examples, while the Hellenistic pastoral of Theocritus and Longus romanticized shepherds as figures of past innocence, and Christian iconography represents Christ as a shepherd caring for his flock.

Animals were the objects of scientific enquiry for scholars such as Aristotle (*History of Animals*) and the 14th-century writer of the Byzantine *Diegesis ton Tetrapodon Zoon* [Descriptions of Four-Legged Animals]. Foreign fauna interested travellers such as Herodotus and Kosmas Indikopleustes and the Byzantines exhibited exotic creatures such as lions, leopards, crocodiles, bears, antelopes, and ostriches in the hippodrome and in zoos – in the 11th century Constantine IX Monomachos set up a menagerie in Constantinople (Attaleiates, 48–50). Wild animals provided entertainment by fighting (*theriomachountes*), each other or humans; animal–human combat is documented by Justinian I (*Novellae*, 105. 1) and features in Christian martyrology and hagiography.

Horses were valued highly for their service in battle and equestrian competition. The Homeric heroes in their horsehair-crested helmets fight from horsedrawn chariots and many, in particular Hector, are epithetically tamers of horses. Several war horses have their names recorded (unusual for animals): Alexander's Bucephalas was famous (Plutarch, *Alexander*, 61, Strabo, 698) while Achilles' horses, including Xanthus who prophesied Achilles' death (*Iliad*, 19. 478–94), mourned Patroclus (*Iliad*, 17. 443–47). At Athens the citizen class of cavalrymen, said to have been instituted by Solon, consisted of men from wealthy families – the cavalry provided their own horses. Equestrianism was associated with the rich; in

Aristophanes' *Clouds* Strepsiades complains that his son is bankrupting him with his mania for horses and racing. At the Panathenaic games competitors rode bareback or drove four-horse chariots around the race course (*hippodromos*). Pindar in an epinician ode records the victory of a successful race-horse, Pherenicus (*Olympian*, 1. 18), and many of the prize vases presented to the victors depict races. However, Church Fathers such as John Chrysostom were less enthusiastic about horse-racing (*Patrologiae Cursus, Series Graeca*, 59. 519. 33–34).

Animals are often anthropomorphized; writers from Aesop to Aristotle (*Historia Animalium*, 488b13–24) ascribed to animals human characteristics, while Aristophanic comedies such as *Birds* and *Wasps* and the political verse of 14th-century Byzantium such as Theodore Prodromos's *Katomyomachia* and the anonymous *Porikologos* and *Opsarologos* used animals to satirize contemporary society. Human beings are often described in animal terms – greedy people are like wolves, timid people are like deer, and, according to Semonides' poem of the 7th century BC which categorizes women according to animal type, chaste women are like bees (fr. 7 Diehl). The animal skins worn by maenads and the lion slayer Heracles represent an immediate association with the natural and the wild, yet too intimate an affinity with the bestial collapses the radical distinction between humans and other animals, an important predicate of Greek thought in antiquity and the Christian era, although the theory of reincarnation associated with the Pythagoreans which envisaged the transmigration of human souls into animals' bodies blurred this boundary. Hesiod separated man from animal on the grounds that men possess justice and do not eat one another (*Works and Days*, 276ff.); the Homeric hero should display the ferocity that wild creatures embody (Achilles entering battle is a ravening lion, *Iliad*, 20. 164–73) but should not become too beastly (Achilles' desire to eat Hector raw, *Iliad*, 22. 345–46)); the wild carnage and desire to eat raw flesh assimilates the bestialized man to the non-human, a wild animal or a monster like the uncivilized, cannibalistic Cyclops.

Greek myth transforms human beings into animals typically as a punishment: the witch Circe turns Odysseus' crew into pigs (*Odyssey*, 10. 233–43); Artemis makes Callisto a bear and Actaeon a stag; Lycaon, who sacrificed his child to Zeus, became a wolf (and was associated with the werewolf cult). Myth produced a variety of species hybrids like the hippocampus (horse–fish) and chimaera (lion–snake–goat) but Greek myth was interested particularly in animal–human mixtures such as satyrs (donkey–men) and centaurs (horse–men), anomalous creatures which, in blurring the human–animal boundary, draw attention to its importance. The wildness of drunken satyrs, played in satyr drama and painted on sympotic pottery, suggested the dangerous pleasures of bestializing Dionysiac excess; the centauromachy of the Parthenon in which the savage centaurs who disrupt the wedding feast are defeated by the Lapiths signifies the victory of civilization over wildness. Animal imagery is important too in Christian myth and iconography; in the Byzantine period the *Physiologos* and *Hexaemeron* used animals to symbolize virtues and vices and throughout the Christian era the devil has been represented as a snake. Dragons too were identified with evil and with enemies of the Church such as the emperor Julian (361–63); saints such as George and Elisabeth were portrayed defeating dragons.

Artemis, associated iconographically with the stag, was mistress of wild animals (*Iliad*, 21. 470) and she protected them, although as the huntress she killed beasts. Similes of hunting and wild predators are common in Homer and scenes of horses and hounds were popular with artists, who depicted the killing of deer, boar, hares, and lions. In the Byzantine period scenes of animal–human combat were added to this repertoire, as were illustrations of falconry, a popular pastime. A portion of the hunted animal was offered to the gods, yet wild animals were seldom thought to be the proper objects of sacrifice (one exception is the cult of Artemis at Patras: Pausanias, 7. 18. 12). The ritual slaughter of domestic beasts, however, was ubiquitous, although the vegetable offerings and vegetarianism of Orphic and Pythagorean cult ran counter to this principle. The best sacrifice was a bull; also of value were cows, sheep (rams were better than ewes), pigs, and poultry. Pigs were slaughtered in purification rituals. Fish and smaller animals were rarely offered to the gods, although Pausanias mentions puppy sacrifice (3. 14. 8).

The choice of sacrificial victim sometimes mirrored a religious iconography that frequently associated gods with specific animals: at Athens Athena, who carries a goatskin aegis, was honoured with goat sacrifices, while more generally bulls were connected with Zeus and Dionysus, cattle with Hera, doves with Aphrodite, and horses with Poseidon, mythically the ultimate ancestor of the horse. Typically sacrifice entailed the ritual cutting of the animal's throat, but at Argos horses were drowned for Poseidon (Pausanias, 8. 7. 2). Christianity rejected the tradition of animal sacrifice but pagan magic continued to use animals.

Animals were important in prophecy; seers inspected the entrails of sacrificial victims and augurs inferred the future from watching birds in flight and, less commonly, fish swimming. Birds of prey were particularly significant: the eagle was Zeus' bird, and Hesiod's tale of the hawk and the nightingale is a fable of kingly power (*Works and Days*, 202–12). Snakes, thought to be intermediaries between this world and the next, were associated with oracles, with the dead, and with chthonic deities such as Aeschylus' snaky-haired Erinyes. Indeed, several autochthonous myths have serpentine nuances; Cecrops, the first earthborn king of Athens, was a serpent from the waist down, while the foundation of Thebes was marked by the birth of the Spartoi, sprung from the dragon's teeth.

Traditionally the Greeks have kept animals for their usefulness, but in modern Greece cats and dogs, caged birds, and fish are popular pets and even in the ancient world some animals lived indoors; Telemachus' dogs follow him around the house (*Odyssey*, 2. 11, 17. 62), Theocritus' housewife orders her slave to let the dog in and keep the cats out of the knitting basket, although the cats here – *galeai* – may have been pole cats (*Idyll*, 15. 44 and 28), and the Byzantines kept animals as companions. Homer in particular describes human affection for animals: Polyphemus' doting care for his flock is his one redeeming characteristic (*Odyssey*, 9. 446–60) and Odysseus weeps when his old dog Argos dies (*Odyssey*, 17. 290–327).

Anthology, Greek

Collection of epigrams from the 7th century BC to the 10th century AD

The present *Greek Anthology* is the culmination of a process of anthologizing which began in the 3rd century BC. It properly consists of two collections of epigrams written mainly in the elegiac metre. The *Palatine Anthology* is a compilation from the 10th century AD of 3765 poems, so called from a manuscript once in Rome and now divided between Heidelberg (Universitätsbibliothek, Palat. gr. 23) and Paris (Bibliothèque Nationale, suppl. gr. 384). The *Planudean Anthology* is a 13th- or 14th-century compilation of approximately 2,400 poems, of which 388 do not appear in the *Palatine Anthology*. It was this shorter collection, first published in 1494 by the Byzantine émigré John Laskaris, that was long known in the West as the *Greek Anthology*. The *Palatine Anthology* was not published until the early 19th century, by Friedrich Jacobs (Leipzig, 1813–17).

It was common practice for individual poets of the Hellenistic period to collect their own short poems into an individual book, and the *Soros* [Heap] may have been a joint edition of the epigrammatists Asclepiades, Posidippus, and Hedylus in the early 3rd century BC. True anthologies of poems by different authors were much rarer, although there is some scanty evidence for them from the end of the 4th century BC. The earliest extensive such compilation known today appears to be the *Stephanos* [Garland] of Meleager of Gadara in Syria, which was put together around 100 BC. This is an artistically arranged selection of poems from the previous two centuries, to which Meleager added a preface in which he named all the poets and attributed to each the name of a flower. His collection included graceful poems of his own composition, mainly erotic and addressed to both boys and girls. A second *Garland*, arranged alphabetically by the first word of each poem, was compiled, probably during the reign of Nero, by Philip of Thessalonica. His choice was more eclectic than Meleager's with less emphasis on love and more on rhetorical description (his personal contribution comprises 80 such poems). The first compilation to be called an "anthology", literally a "gathering of flowers", is that of Diogenianus of Heraclea during the time of Hadrian, although the title may be a lexicographer's description and not Diogenianus' own. *Cycle* was the name selected by the lawyer and historian Agathias of Myrina for a further anthology published probably shortly after AD 560. This contains classicizing epigrams by his Constantinopolitan friends and about 100 from his own hand.

The first really comprehensive anthology was that of Constantine Kephalas, who was possibly a palace chaplain

mentioned by chroniclers as active in 917. It comprised the poems gathered by Meleager, Philip, Diogenianus (probably from a 4th-century abridgement), Agathias, and other anthologists and in further individual collections such as the pederastic *Musa Puerilis* of the 2nd-century AD poet Straton of Sardis and the often humorous and satiric poems of the 4th-century AD Alexandrian schoolmaster Palladas. Remarkably, it also included poetic inscriptions on Byzantine churches copied down by a contemporary, the *magistros* Gregory of Kampsa (in Macedonia), during his travels in Greece, Macedonia, and Asia Minor. Although Kephalas's anthology is lost, it formed the bulk of the surviving *Palatine Anthology*. This huge compilation included additional Christian and rhetorically descriptive epigrams. Its compiler is unknown, but it may have been the early 10th-century poet Constantine of Rhodes, three of whose poems it includes.

The *Palatine Anthology* is divided thematically into 15 books of widely differing lengths. Their contents are: (1) 123 Christian epigrams that are mainly copies of inscriptions on Byzantine churches; (2) 65 descriptions in hexameters by the 5th- to 6th -century Egyptian poet Christodoros of Koptos (known also as of Thebes) of the statues of Classical mythological and historical figures in the baths of Zeuxippos in Constantinople; (3) 19 epigrams on filial mythological themes inscribed by two brothers on the columns of a temple at Cyzicus in honour of their mother; (4) the four prefaces to their anthologies of Meleager, Philippos, and Agathias (2); (5) 309 amatory epigrams; (6) 358 dedicatory epigrams; (7) 748 epitaphs; (8) 254 epigrams of St Gregory of Nazianzus; (9) 827 declamatory and descriptive epigrams; (10) 126 hortatory epigrams; (11) 64 convivial and 378 satiric epigrams; (12) 258 erotic and usually pederastic epigrams attributed, probably not always correctly, to Straton; (13) 31 miscellaneous poems in 30 different metres or combinations; (14) 150 arithmetical problems (perhaps all by Metrodoros), riddles, and oracles; (15) 51 miscellaneous poems including six *technopaegnia* (jeux d'esprit), the shapes of whose lines resemble panpipes, an axe, a pair of wings, an altar (two poems), and an egg.

Around 1300 Maximos Planudes, a scribe in the imperial palace and translator of Latin texts, made his own anthology of epigrams. For this he used three now lost manuscripts, two of collections similar to the *Palatine Anthology* and a third of an abridged version of Kephalas's collection. Planudes both rejected many poems and, making skilful use of his metrical knowledge, "emended" others to reflect contemporary propriety. The *Planudean Anthology* is divided into seven books – epideictic, satiric, funerary, ekphrastic epigrams, the hexameters of Christodoros, votive, and amatory epigrams. Each book is subdivided, poems on each theme being arranged alphabetically. Planudes' autograph manuscript (Venice, Biblioteca Nazionale Marciana, Marc. gr. 481) is dated 1301 (or 1299) and there survive also a preliminary and an incomplete final revision done under the compiler's supervision. The 388 poems unique to this compilation, usually collectively called the *Planudean Appendix* or, incorrectly, book 16 of the *Palatine Anthology*, are mainly epigrams about or imaginarily inscribed upon statues and paintings.

The *Anthology* has had a decisive influence on the literatures of modern European languages, especially during the Renaissance. In Greece itself, however, it was largely unknown to the vernacular poets, and the writers in the "purified" language (katharevousa) turned rather to French and Italian models. The main exception is Cavafy, an Alexandrian like many of the poets in the *Anthology*. Many of his poems are on Hellenistic themes, while the homoerotic ones are often inspired by or even based upon the *Anthology*'s epigrams of death and love. Unlike their predecessors, however, they are not pederastic, and, despite being less explicit, are generally more sensuous and anguished as a result of both his own personality and the contemporary attitude towards homo-sexuality.

The *Greek Anthology* is a garden with possibly more weeds than flowers, but it shows in an incomparable way the development of the genre of the epigram over more than one and a half millennia. It contains some of the most exquisite poems ever written in Greek: the world would be immeasurably the poorer were it not for its survival.

Summary

The *Greek Anthology* is a collection of Greek epigrams dating from the 7th century BC to the 10th century AD. It consists of two collections – the *Palatine Anthology* (3765 poems) compiled in the 10th century and the *Planudean Anthology* (which contains 388 additional poems in its total of about 2400) compiled in the 13th–14th centuries. It demonstrates the evolution of the Greek epigram as a genre over more than 1500 years.

Anthropology, Social

Social anthropology (*anthropos*: Greek for "human being") involves the study of societies, particularly the cultural values and institutions such as religion, law, or politics that organize relations between people. Anthropologists attempt to understand how people in various communities perceive and inhabit their worlds. The focus below will be on social anthropological studies of Greece as well as anthropological studies done by Greeks.

Herodotus is generally viewed as the father of anthropology. He travelled extremely widely for a man of his time, from the Black Sea to Aswan in Upper Egypt, and from Sicily to Cyprus. His *Histories* mention more than 50 different tribes or "nations", including lengthy descriptions of the Egyptians and

the Scythians. He did not stay long in these various places; he was more like a tourist than an ethnographic fieldworker. What distinguished him from earlier historians and mythographers was his application of a rationalist approach, which he called *historia*, literally "research, inquiry" – the very same term the early philosophers used to describe their investigations of nature. He would compare accounts and reject the less likely, or register his own scepticism. As he demurs at one point, "For myself, my duty is to report all that is said, but I am not obliged to believe it all."

Herodotus approached the study of society with distinct categories and questions in mind. He operated according to an implicit social theory that led him to scrutinize descent, language, and religion as the criteria that distinguished one group from another. In his accounts of specific groups he tended to emphasize marriage customs, religious rites, burial practices, and food habits – categories that would shape subsequent ethnographic thought throughout the Middle Ages. The pole of comparison of these various forms of life was, of course, the 5th-century Greek world. In kinship and marriage, for example, the Greeks were patriarchal and patrilineal, and this made for comparative interest in the Lycians who reckoned descent matrilineally, or in the Massagetae who were promiscuous, or the Issedonians who ate their dead parents, but treated their wives as equals.

Herodotus' rational historical method tended to break down in the description of peoples inhabiting the limits of the known world such as the Issedonians. His report that in India there was a tribe "that will not take life in any form; they sow no seed, and have no houses and live on a vegetable diet" apparently contained a kernel of truth. Yet in other passages he wrote of people with feet like goats and others who slept half the year. The Roman imperial historian Pliny continued this exoticizing of peripheral peoples, expanding Herodotus' inventory of ethnological curiosities to include the Gamphastes who went naked and practised non-violence, and the headless Blemmyae whose eyes and mouths were set in their chests. These and other fantastic stories found their way on to medieval maps and influenced the perception of the world until the age of exploration.

The 16th and 17th centuries not only brought Europe into contact with hitherto unexplored parts of the world, it was also the period of the rebirth of humanistic interest in ancient Greece. One result of this historical coincidence of philological and geographical exploration was the appearance of books comparing the institutions and values of the ancients with those of contemporary "savages" in the newly colonized world. The French missionary Joseph-François Lafitau's 1724 volume comparing native North Americans to the Greeks and Romans was just one example of this trend. In addition to his primary interest in religion, Lafitau collected correspondences in domains such as government, family organization, education, and the gendered division of labour. The general conclusion that Lafitau and his contemporaries drew from this kind of research was that native Americans and the people of Classical antiquity must have sprung from one and the same source.

The chronological and evolutionary specifics of the relationship between contemporary inhabitants of small-scale societies and the ancients were further worked out in the 19th century. The view of high Victorian anthropology drew heavily on the ideas of evolution and progress. For E.B. Tylor, who became the world's first professional anthropologist upon assuming a readership at Oxford in 1884, all humans possessed the same mental equipment but some had developed faster and further than others. He divided humanity into three stages: savagery, barbarism, and civilization. The Britain of his day exemplified the last stage, and he and his countrymen could look at small-scale societies in places like Africa and Melanesia, or ancient societies in Greece or Rome, to see what they had once been like. Savagery was characterized by "animism" – the idea that spirits and supernatural beings animated and controlled the natural and human worlds. Homeric descriptions of the souls of warriors departing through their mouths at death could be compared with similar beliefs among peoples of the Malay archipelago. Tylor also considered that isolated elements from earlier stages of humanity could filter through to civilized societies as "survivals" – little irrationalities and superstitions like saying "Bless you!" when someone sneezed.

One of the goals of Tylor's follower, Sir James Frazer, was to identify and extirpate these survivals, thereby paving the road to progress. Frazer's multivolume work *The Golden Bough* (1890–1915) exhaustively catalogued and compared beliefs in fertility, death, and resurrection held by ancient societies, contemporary "primitive" societies, and even European peasants who, it was thought, had not been touched by "civilization". Frazer was an accomplished Classical scholar and his cross-cultural ethnographic learning also found its way into his six-volume commentary on the Greek traveller Pausanias. His influence touched the turn-of-the-century "Cambridge Ritualist" school of Jane Harrison, F.M. Cornford, and others, who made ample use of cross-cultural materials in presenting their arguments about the priority of ritual to myth in ancient Greek society.

Beginning with Bronislaw Malinowski in the 1920s, fieldwork, involving a residence of a year or more among the people under study, became the standard method of data collection in anthropology. During this time the anthropologist was expected to learn the language of the group under study and attempt, through the method of "participant observation", to capture "the native's point of view". Malinowski eschewed the hypothetical historicism of his Victorian predecessors. Societies were to be explained by his functional theory that emphasized how institutions enabled people to adapt to their environment and maintain social harmony in the present.

Malinowski's revolution spelled the end of the comparative, evolutionary, anthropological interest in ancient Greece that had flourished since the Renaissance, and it was not until after World War II that a variety of new approaches began to emerge. In 1955 Claude Lévi-Strauss published his essay on "The Structural Study of Myth" in which he applied his structuralist method to the myth of Oedipus. This called for a solid ethnographic knowledge of the society and the region whose myths were being considered. Lévi-Strauss was no specialist on ancient Greek culture and he even admitted in the course of his essay that Oedipus was "an arbitrary example, treated in an arbitrary manner". His structuralist method, however, was later to prove fruitful in the hands of the French Classical scholars Jean-Pierre Vernant and Marcel Detienne who

produced stunning analyses of the cult of Hestia and the myth of Adonis respectively. These analyses depended upon detailed knowledge of Greek domestic space arrangements, ideas about gender, sexuality, and the symbolic associations of herbs and spices, to name just a few cultural categories.

Another postwar development was the general application of anthropological theories to illuminate Classical Greek values and institutions. The classicist E.R. Dodds (*The Greeks and the Irrational*, 1951) borrowed the American anthropologist Ruth Benedict's distinction between shame and guilt cultures to differentiate the Homeric world, where public appearances counted most, from the world depicted by the Classical tragedians, where actors were riven by internalized dilemmas. In another novel departure the ancient historian M.I. Finley applied the economic anthropological theories of Mauss and Polanyi to the understanding of ancient Greek gift giving, friendship, and trade (*The World of Odysseus*, 1954). From this point onwards anthropological theories and comparative examples have featured prominently and regularly in major works such as Walter Burkert's study of Greek sacrifice (*Homo Necans*, 1983) or James Redfield's study of social values in Homeric epic (*Nature and Culture in the Iliad*, 1975).

The study of modern Greek societies through ethnographic field research represented another important mid-20th-century departure. Up until this moment modern Greek village life and traditonal beliefs had been the province of folklorists and travellers from the 19th century and earlier. Scholars such as John Cuthbert Lawson and Nikolaos Politis were primarily interested in discovering survivals of ancient culture in modern Greece. Although roughly contemporary with the British Victorian anthropologists mentioned above, these folklorists took an entirely different view of survivals. In their view survivals added to knowledge about the revered ancients while also furnishing documentary evidence that the modern Greeks really were valid descendants of the ancients. This was an important national issue for the Greek state after nearly 400 years of Ottoman domination.

The new generation of anthropologists were not concerned with these issues, but rather with Malinowski's programme of rendering a holistic account of the community under immediate study. The American anthropologist Ernestine Friedl presented a monograph (1962) describing life in a Boeotian farming village that considered issues of tradition and modernity. And John Campbell published an account (1964) of the Sarakatsani, a transhumant group of pastoralists in Epirus. Campbell's study was the first full-length exploration of a cognatic kindred, a system where descent is reckoned through both parents. More theoretical focus was given to early anthropological research in Greece by John Peristiany, arguably the first Greek anthropologist to emerge after Herodotus. Peristiany conducted fieldwork in his native Cyprus and edited an influential volume entitled *Honour and Shame: The Values of Mediterranean Society* (1966) that drew together studies documenting a pan-Mediterranean set of complementary values. Men in these societies were held to possess "honour" – the ability to protect one's immediate kin, property, and good name. Women, on the other hand, possessed "shame" – the obligation to conduct themselves with modesty.

Once thought to be the key to understanding Greece, and all Mediterranean societies, the honour and shame complex has been criticized as too rigid. Current research in Greece has moved on to consider the fundamental duality in modern Greek social identity between Classical/western and Ottoman/eastern alternatives – between Hellenism and *Romiosyni*. Among themselves, contemporary Greeks may acknowledge the Ottoman influences on their culture and speak in affectionate, expressive terms that contain numerous Turkish-derived words. For purposes of self-presentation to outsiders these features are downplayed and links with the ancients are emphasized. In such situations more vocabulary may be selected from the katharevousa register, a version of modern Greek invented in the 19th century and designed to purge the spoken language of Turkish and Balkan elements. The performance of Greek identity thus involves constant code-switching between Hellenic and Romaic registers.

One consequence of the florescence of anthropological research on contemporary Greece and Cyprus is that Classical historians may now draw on these data to inform their reconstructions of earlier communities in the very same regions. Archaeologists have exploited this situation to make advances in the area of ethnoarchaeology. In order to further their understanding of ancient Greek subsistence and seasonal work patterns, for example, they may conduct field research among contemporary farmers and shepherds to gain an idea of how much grain a hectare of land normally yields, or how much milk a flock of sheep and goats can provide.

The orientation of this research is paralleled in the work of historians such as David Cohen who argue that the honour and shame complex identified through anthropological research in Greece may deepen the understanding of public morals in Classical Athens. Since independence in 1832 the Greek state, supported by folklorists and foreign travellers, has asserted that it continues the rational and sophisticated traditions of the ancients. Lying, vendettas, and the practices of remote agriculturalists probably did not figure in the state's initial vision of claimable survivals. An unintended consequence of this new research is that the ancient Hellenes now resemble *Romii avant la lettre* and contemporary practices hitherto disparaged as Romaic can now be confidently claimed as Hellenic.

The anthropology of Greece has come full circle in one other respect. Anthropological practice underwent critical reexamination in the 1980s resulting in greater sensitivity to the issues of representation and reflexivity. In principle this meant that more space should be given to representing the unmediated statements and opinions of the people under study, even to the point of making them co-authors of the ethnography. Reflexivity called for the anthropologists to include more information on their personal experiences and feelings in the field. These theoretical developments coincided with the establishment of social anthropology as an academic discipline in Greek universities. Increasing numbers of Greek anthropologists are now undertaking extensive field research in Greece. This rise of an indigenous anthropology offered one solution to the "crisis of representation". Greek anthropologists such as Neni Panourgiá, Nadia Seremetakis, Evthymios Papataxiarchis, and Vassos Argyrou have been able to utilize their total linguistic competence and relative insider status to

offer striking accounts of death as experienced within an Athenian family, funeral lamentation in Mani, patterns of drinking and friendship on the island of Lesbos, and champagne as opposed to "traditional" weddings in Cyprus respectively. Public debates have centred on whether these indigenous anthropologists can render more valid accounts of Greek society. The preliminary verdict seems to be "no"; there are likely to be as many different anthropological accounts of a given society as there are anthropologists.

Antigonids

Dynasty of Macedonian kings

With the death of Alexander the Great in 323 BC and the murder of all the members of his immediate family within the following 30 years, the Argead dynasty of Macedonian kings (of which Alexander was a member) was extinguished. The throne of Macedonia was vacant and briefly occupied by various contenders, creating a political situation of great turmoil and instability. Only when Antigonus Gonatas secured the throne around 277 BC, held it for nearly 30 years, and sired a son who inherited it, can we speak meaningfully of the Antigonid dynasty of kings of Macedonia, but their roots in Macedonian history go back for more than half a century.

The grandfather of Gonatas was Antigonus Monophthalmus (the "One-Eyed"), who was a general throughout the Asian expedition of Alexander the Great. After Alexander's death, he was declared "general" (in Greek *strategos*) – essentially supreme commander – of all Asia, which gave him great power and control over a vast territory. Throughout the next 20 years Antigonus fought to consolidate his position and extend his power at the expense of the other successors of Alexander. At the period of his greatest successes, it might be argued that he came closest to recreating Alexander's kingdom. After some notable military victories, he declared himself and his son Demetrius "kings" in 306 BC. Although they were "kings" without a kingdom in geographical terms, this joint claim suggests that Antigonus intended to establish a hereditary line of rulers.

Antigonus Monophthalmus died on the battlefield of Ipsus in 301 BC, facing a coalition of the other successors. His son Demetrius Poliorcetes ("the Besieger"), who had already acted as Antigonus' roving general throughout Greece and Asia, inherited his father's ambitions. He interfered in the politics of mainland Greece, subdued Athens for a time, and was briefly declared king of Macedonia. In 293 BC Demetrius founded by synoecism a new city, Demetrias, near the site of Classical Pagasae (in turn near the site of Bronze Age Iolcus, from where the legendary Jason set forth on his journey to find the Golden Fleece) in the Gulf of Volos, a few kilometres from the modern city of Volos. In 285 BC, in the course of attempting to recover his father's Asian possessions, Demetrius was captured by Seleucus I of Syria and died in captivity two years later.

Antigonus Gonatas, the son of Demetrius and his wife Phila (the daughter of Antipater, the regent of Macedonia during Alexander the Great's absence), immediately took the title of king and entered the fray for the throne of Macedon. He finally secured it around 277 BC. His long reign saw the Chremonidean war in the 260s BC, when Athens and Sparta tried unsuccessfully to overthrow Macedonian control, and naval victories over the Ptolemies at the battles of Cos and Andros (usually placed in the context of the Chremonidean war). Gonatas died in 239 BC, having outlived all his royal contemporaries. Although his control over mainland Greece was insecure and he had been threatened in Macedonia, he reestablished Macedonia as a nation and made it a kingdom to be ruled by his descendants. On the cultural side, Antigonus had been a pupil of the philosophers Menedemus of Euboea and Zeno of Citium, and his court at Pella was a centre for writers and scholars, among them the historian Hieronymus of Cardia (author of the most reliable account of the decades after the death of Alexander the Great), and the poets Aratus of Soli and Alexander Aetolus.

Gonatas' son Demetrius II had probably been acting as the king's general during much of his father's long rule, but his defence of Macedonia against an Epirot attack at the time of the Chremonidean war is his only known action. He fought a war against Aetolia and the anti-Macedonian Achaeans around 238 BC, and was killed fighting the Illyrian Dardani tribe on the Macedonian frontier in 229 BC, leaving an eight-

year-old son, Philip, to face the barbarian threat and the consequences in Greece of a weakened Macedonia.

The boy king Philip V was placed in the care of a regent, Antigonus Doson, a grandson of Demetrius Poliorcetes from one of his minor marriages. Antigonus proved a blessing to the threatened Macedonia, and his loyalty to the young Philip remained unshaken even after he was himself granted the throne around 227/26 BC (thereby becoming Antigonus III). Doson defeated the warlike Dardani tribe, and turned his attention to the south and east. He defeated the Aetolians and Thessalians in 228 BC, and made an expedition to Caria in 227 BC (the circumstances, cause, and purpose of this adventure remain obscure). His chance to re-establish Macedonian influence in mainland Greece came at the surprising request of the usually anti-Macedonian Aratus of Sicyon (the head of the Achaean League) for help in the Peloponnese against the aggressions of Sparta and Aetolia. Doson readily agreed, and was formally offered the citadel of Acrocorinth (which dominated the Isthmus of Corinth) in return for his military support in 225–24 BC. Corinth was occupied by a Macedonian military garrison, and Doson pushed back the threatening Spartan king.

One of the most important acts of Doson's reign was the foundation in 224 BC of the so-called Hellenic League, an alliance of existing Greek federations under Macedonian hegemony. The various federations were to be internally autonomous but interdependent with respect to foreign policy. The foundation of the Hellenic League was potentially significant because Greece was shortly to face the power of Rome, and it is a landmark in the history of federalism. Unfortunately, Doson's premature death prevented the fruition of his plans having real effect. After recovering Arcadia in 223 BC and defeating the Spartan king Cleomenes III at the battle of Sellasia (just north of Sparta) in 222 BC, he returned to Macedonia to face another Illyrian invasion. A burst blood-vessel in his lungs worsened his already weak health, and he died some months later in 221 BC, having provided for the education of his charge Philip V by sending him to Aratus of Sicyon, Macedonia's recent ally, to learn about Greek affairs.

The accession of Philip V as an independent monarch marks the beginning of the end for an independent Macedon, due to its involvement with a now very powerful Rome. Philip was still a teenager when his regent Doson died, but he was immediately plunged into the so-called Social War in which he and the newly founded Hellenic League faced Aetolia and its allies. The war lasted from 220 to 217 BC, and marked Philip's growth into a mature king. He gradually turned away from his new mentor Aratus and towards the camp of an Illyrian dynast named Demetrius of Pharos (the island of Hvar in modern Croatia) in the Adriatic Sea. Rome had rewarded Demetrius with the rule of this petty state when he delivered Corcyra (modern Corfu) into Roman hands, but his various aggressions in the Aegean caused Rome to expel him in 219 BC, and he escaped to Philip in Macedonia nursing a major grievance. Demetrius encouraged Philip's alienation from Aratus and the Achaean League and continually incited him against Rome, in the first instance against the Romans in Illyria. Furthermore, Philip's treaty with the Carthaginian general Hannibal was the death-knell of any hope of friendship with Rome.

The First Macedonian War between Macedonia and Rome began in 214 BC, and soon Rome forged an alliance with Aetolia against Philip. The war began inauspiciously for Philip, with various disasters in the Peloponnese, an ultimate break with Aratus, and the forced burning of his fleet, but his superior forces on land, combined with Roman inaction at critical periods, forced terms on Aetolia in 206 BC. The First Macedonian War was ended by the Peace of Phoenice (a city in Epirus, now in modern Albania), proposed by Rome in 205 BC and favourable to Philip.

Philip turned his attentions eastward, colluding in 203/202 BC with Antiochus III to divide Egypt and experiencing a naval defeat off the island of Chios in 201 BC at the hands of the combined Rhodian and Pergamene fleets. Fearing Philip's intentions, Rome declared the Second Macedonian War in 200 BC. Campaigns were fought in Greece, Thrace, Macedonia, and Thessaly, sometimes with notable successes for Philip, until in desperation Rome appointed Titus Quinctius Flamininus to the command in 198 BC. Under his leadership, in 197 BC the Romans decisively defeated Philip's forces at the battle of Cynoscephalae in Thessaly. Harsh military and financial terms were imposed upon Macedon, and Philip's elder son Demetrius was taken as a hostage to Rome.

Confined to Macedonia as part of the peace terms, Philip concentrated on rebuilding his country. He was now perforce an ally of Rome, albeit an uneasy one, and he had to be seen to support it – which he did against the usurper Nabis of Sparta, Antiochus III, and Aetolia. Rome remained suspicious of Philip, rightly so in view of his aggressive policy in the Balkans after 185 BC (defeating various Thracian tribes, resettling some, and making alliances with others). Philip, probably with the connivance if not the encouragement of his younger son Perseus, engineered the death of his pro-Roman son Demetrius after he was freed from his Roman sojourn, and secured the succession for Perseus, who shared his imperialist tendencies. On a tour of his kingdom in 179 BC, Philip V died of sickness at Amphipolis.

Upon his accession to the throne, Perseus renewed his treaty of friendship with Rome, but carried on his father's policy of consolidating Macedonia. He furthermore made a convenient dynastic marriage to Princess Laodice, daughter of Seleucus IV of Syria. Complaints by Eumenes II of Pergamum in the Roman Senate about Perseus' growing power led to the declaration of the Third Macedonian War in 171 BC. Macedonian advantages in the early years of the war were ended by the appointment of the Roman general Lucius Aemilius Paullus to the command in 168 BC. The Roman forces utterly defeated Perseus at the battle of Pydna (on the east coast of Macedonia south of Thessalonica) in 168 BC. Perseus fled to Samothrace but finally surrendered to the Romans. He and his children were taken captive to Rome, paraded in chains in Paullus' triumph, and the king – the last of the Antigonids – died in a Roman prison shortly thereafter. Macedonia was sacked of all of its wealth and its people were treated harshly. The royal kingdom was abolished, and the country was divided into four republics with elected officials who operated under Roman supervision. A pretender to the throne, Andriscus from Adramyttium in the Troad, claimed to be the son of Perseus, and raised some support for his cause. He had some military successes *c.*153–148 BC but was defeated by the Roman general

Q. Caecilius Metellus Macedonicus, captured, paraded in triumph at Rome, and executed. Macedonia became a full province of Rome in 146 BC.

The Antigonids re-established Macedonia as a nation after the years of Alexander the Great's absence, the decades of chaos after his death, and the extinction of the Argead dynasty. Under their rule, the country gradually regained its prosperity after the severe depletion of manpower occasioned by the removal of some 40,000 men in their prime to accompany and reinforce the expedition of Alexander the Great. The wealth of Macedonia could not perhaps compete with that of the Ptolemaic and Seleucid empires, but the amount that was removed by the Romans (attesred in literary sources) shows that the Antigonid kings could hold their own among other Greek monarchs. However, it was the serious mistakes in judgement by the later Antigonid kings regarding the level of Rome's interest in the Greek east and its ability to carry out its policy that led Macedonia to lose its independence and became the first of the Hellenistic empires to fall under Roman control.

Antioch

City in the Roman province of Syria

Antioch (now Antakya in Turkey) was founded by Seleucus I in 300 BC on the left bank of the Orontes, *c.*24 km from the sea, by transfer of 5300 Athenian and Macedonian settlers. The city became the capital of the Seleucid empire, and subsequently of the Roman province of Syria. In addition to being a great centre of administration the city benefited from being on the trade route from Asia to the Mediterranean. Its population, which in the 4th century AD reached around 250,000, was matched in the east only by that of Alexandria, and later that of Constantinople. At that time the city was a splendid sight with an imperial palace, an octagonal cathedral, churches, colonnaded streets, baths and theatres, and mansions with beautiful mosaic floors at the residential suburb of Daphne. The inhabitants were of mixed origins, but the city was Greek in political institutions, culture, and language, and from it Greek language and civilization spread into the villages and towns of northern Syria.

The most important Antiochene secular writers, both of the 4th century AD, were Ammianus Marcellinus, who adapted the tradition of Greek historiography to compose a Latin history of the Roman empire, and Libanius, the most famous orator of his time, a pagan whose pupils included St John Chrysostom and probably St Basil of Caesarea. Antioch had a large Jewish community, and Christianity came there very early. It was the starting point of Paul's mission to the cities of the Greek east, and it was here that Christians were first called by that name. The Antiochene school of biblical exegesis, in contrast to that of Alexandria, emphasized the importance of the literal as against the allegorical meaning of the text. Influential exponents were Diodorus of Tarsus, John Chrysostom, Theodore of Mopsuestia, and Theoderet of Cyrrhus. Antiochene exegesis became associated with Nestorianism, and was forced out of the empire after the Second Council of Ephesus (449). Its traditions continued in the Nestorian school at Nisibis, where much Greek philosophy and theology was translated into Syriac.

The patriarch of Antioch was the leader of all bishops between the Taurus and the Egyptian border, though his authority was weakened during most of the 4th century by divisions in the Antiochene Church. In the Christological controversies of the 5th and 6th centuries supporters of Chalcedon were generally in the majority at Antioch. But Severus, patriarch 512–18, was a principal Monophysite theologian. He wrote in Greek, though his works survive only in Syriac. The hinterland of Antioch became Monophysite and developed a liturgy and literature in Syriac. Later a separate Monophysite patriarchate was established, but its bishop usually resided in a monastery outside the city.

Antioch was devastated by an earthquake in 528 (others struck in 551, 557, 587, 588). It was captured and burnt by the Persians and many of its inhabitants deported in 540. In 542 Antioch suffered the first of a series of visitations of plague. In the early 6th century the city was rebuilt by Justinian I, but the island quarter – the location of the palace, the cathedral, and the hippodrome – was left outside the walls. From 511 to 528 the city was occupied by the Persians, and in 638 it was captured by the Arabs, apparently without much resistance.

Some inhabitants left, and land was assigned to Muslims from Baalbek and Homs. The Chalcedonian (Melkite) community survived at Antioch and after 742 chose a local man as patriarch. The Melkite Church adopted an Arabic liturgy and survives to the present day.

Antioch under the Muslims was a frontier city of an inland empire. Its built-up area seems to have shrunk, particularly after the end of the Umayyad dynasty (750). But the walls remained intact, as did at least two churches and the Roman water supply. In 969 the city was reconquered by the Byzantines who held it until 1089 when it was captured by the Seljuk Turks. In 1098 Antioch was captured by the crusaders after a long siege and became the centre of a Frankish principality which managed to survive, with the help, and sometimes under the suzerainty, of the Byzantine empire. Antioch was once more a large and prosperous city, but in 1268 it was captured and destroyed by the Mamluks. Ever since Antioch has been a small but neat country town, which to the present day preserves considerable traces of its Classical street plan.

J.H.W.G. LIEBESCHUETZ

Summary

City in (ancient) Syria, now Antakya in Turkey. Founded in 300 BC by Seleucus I, it became the capital of the Seleucid empire, and later of the Roman province of Syria. Its people were of mixed origins, but Antioch was Greek in political institutions, culture, and language. Captured by the Arabs in 638, it was Byzantine again from 969 to 1089. Taken by the crusaders in 1098, it was finally destroyed by the Mamluks in 1268.

Antiochus III the Great *c.*242–187 BC

Seleucid king

Antiochus III the Great was the sixth king (223–187 BC)in the Seleucid dynasty and the greatest ruler in the dynasty since Seleucus I (*c.*355–281 BC), the founder of the empire. Son of Seleucus II, he succeeded his elder brother Seleucus III on his assassination in 223 BC. The epithet "great" (*megas*) was probably taken by the king around 204 BC as the result of his eastern expedition of 212–205 BC, though it was subsequently dropped in favour of the title "great king Antiochus" (*basileus megas Antiochos*) that he assumed in 200 BC after his conquest of Coele Syria from Ptolemy V. The title asserted Antiochus' claims over the rule of Asia, following the Persian kings and Alexander the Great, and his superiority over his rivals the Ptolemies, who had claimed the title for themselves.

The best ancient account of Antiochus' reign is that of Polybius, but it is fully preserved only down to 217 BC and is fragmentary thereafter. Polybius must have drawn his information from one or more writers contemporary with the king, though who these were is uncertain. For the story of Antiochus' conflict with the Romans in the 190s BC down to the Treaty of Apamea in 188 BC reliance must be placed on Appian (*Syriake*, 1–44) and Livy (33–38); though derived in part from Polybius, these accounts are written from a Roman, not a Seleucid, perspective, and may not reproduce fully the Polybian original. In addition a large number of Greek inscriptions, chiefly from Asia Minor, provide important information on Antiochus' relations with the Greek communities there.

Antiochus came to power at a young age and in difficult circumstances, but he gradually asserted himself and went on to restore and extend the Seleucid empire as no previous king since Seleucus I had done. A rebellion in the eastern provinces led by Molon, the satrap of Media, who took the royal title, had to be put down (222–220 BC). Achaeus, a relative of the king in charge of Asia Minor from his capital at Sardis, proclaimed his independence and took on the royal title (220 BC), and was not eliminated until 213 BC. A war against Ptolemy IV of Egypt (219–217 BC) resulted in defeat at the battle of Raphia in Palestine, though Antiochus regained control of Seleucia in Pieria. From 212 to 205 BC Antiochus undertook a grandiose expedition to the east (the *anabasis*), perhaps in emulation of Alexander the Great, in which he brought Commagene and Armenia under control, sought to restore Seleucid dominance over Parthia and Bactria (though he was unable to dislodge the ruling king Euthydemus, with whom he made an alliance), and renewed links with India. On his return he made an expedition to the Persian Gulf, though he had to accept the continued independence of the trading city of Gerrha. After an incursion into Asia Minor (204/03 BC) he turned his attention to the successful conquest of Coele Syria, Palestine, and Judaea from Ptolemy V (*c.*202–198 BC). He then moved into Asia Minor to restore Seleucid rule over the Greek cities there, and into Thrace with the object of rebuilding Lysimachea, previously under Seleucid control (197/96 BC). His advance led him into contact with the Romans, who had defeated Philip V of Macedon at Cynoscephalae (197 BC) and had proclaimed the "freedom of the Greeks" at the Isthmian festival (196 BC). Misunderstandings and suspicions developed between both parties as to their respective intentions, and it is not easy to determine the responsibilities for the conflict that eventually broke out when Antiochus landed on the mainland of Greece posing as a champion of Greek freedom against the Romans (192 BC). Expelled by the Romans from Greece (191 BC), Antiochus was then defeated by them at the battle of Magnesia in Lydia (190/89 BC). By the Treaty of Apamea (188 BC) he was forced to evacuate all lands to the north of the

Taurus, reduce his military forces, pay heavy war indemnities, and provide hostages. Significantly reduced, the Seleucid empire remained nevertheless powerful and wealthy. Antiochus himself was killed soon after on an eastern expedition (187 BC) while pillaging a temple of Bel in Elymais.

Antiochus' reputation in the extant sources is very mixed. Polybius found fault in the king's early years when the young ruler lacked authority and experience, though he praised his conduct and achievements in the eastern expedition. He denounced the secret pact that Antiochus allegedly made in 203/02 BC with Philip V to partition the possessions of Ptolemy V. He accused the king of failing in his later years to live up to the promises of his early reign, and thought he had mishandled the campaign against the Romans. The presentation in Livy and Appian of Antiochus' role in the war against Rome is negative. The king is credited with aggressive intentions against Rome, and with mismanaging the war. Roman propaganda also presented him in the guise of an "oriental despot", a second Xerxes invading Greece who was repulsed and defeated by the Romans.

Little is known of the personality of Antiochus (the same is true of most of the kings in the dynasty), though many of his known actions suggest a ruler of exceptional ambition. At some time in his reign (before 193 BC) he instituted a divine cult of himself and his ancestors which was organized on an empire-wide basis, and to which he added (193 BC) a similar cult of his first wife, the Pontic princess Laodice whom he had married in 222 BC. No previous or subsequent Seleucid ruler is known to have done this. He made extensive use of dynastic marriages in his imperial designs, and it is to his reign that belongs the only recorded instance of brother-sister marriage in the dynasty (his eldest son Antiochus was married to his daughter Laodice). On the other hand Antiochus was not a great city founder, unlike Seleucus I and his son Antiochus I, and this affected his subsequent memory. His inglorious end after defeat at the hands of the Romans obscured the memory of his earlier achievements and leaves the historian with an unresolved enigma.

Biography

Born *c.*242 BC, Antiochus succeeded his elder brother Seleucus III in 223. He assumed the title "great" probably in 204, but dropped it in 200 in favour of "great king Antiochus" asserting his claims over Asia. He considerably expanded the territory of the Seleucid empire, but was defeated by the Romans at Magnesia in 190/89 BC. He died fighting in 187 BC.

Anti-westernism

Anti-westernism is a worldwide phenomenon concerning the reaction of native populations in various continents to the political, economic, and cultural imperialism of western Europeans in the wake of their colonization and expansionist policies in modern times. Anti-westernism has been expressed in various forms, including the nativistic and revitalization movements that try to perpetuate indigenous traditions to face the threatening influx of imported elements and to reverse the process of westernization. The term "West" nowadays is not limited to western Europe, but includes other cultural and political units too, especially the US.

The roots of a particular form of anti-westernism that can be observed in Greece as well as in eastern Europe (e.g. in Russia) must be sought especially in the Byzantine period and in the endemic tension between eastern and western Romans for religious and socio-political reasons alike. The Byzantines, due to the geographical position of their empire, mostly used the term "Occident" for Europe and "Orient" for Asia. The west signified for them the *pars occidentalis* of the Roman empire, which by AD 476 had been subjected to the barbarians. Progressively, the Byzantines considered the west as a separate entity, alienated from them, especially after the rise of the Franks and the coronation of Charlemagne as "emperor of the Romans" in 800. The religious tension between the two worlds culminated in the definitive schism of 1054 and was of paramount importance for their continuing estrangement. The consequences of the schism were manifold as far as the Byzantine attitude towards the West was concerned. The foreign occupation of Constantinople from 1204 to 1261 in the wake of the Fourth Crusade as well as theological differences (e.g. the hesychast controversy in the 14th century) deepened the chasm between the two worlds. As a result, the Latin west came to signify for the Orthodox east a geographical

place out of which nothing but dangers and problems had originated. The attempted union of the Churches did not achieve any results, even when the Byzantines faced the threat of Ottoman expansion. The Byzantine preference for the "Turkish turban" rather than for the "Latin tiara" is indicative of the pronounced anti-western sentiments of the day. Even when the traditional notion of Byzantine superiority over other peoples had vanished and western progress was seen as worth imitating, anti-westernism still prevailed as a pattern of orientation on a large scale.

During the Tourkokratia (1453–1821) the schism between East and West intensified in a number of ways. The Greek world was not considered to be a part of Europe, which had been fully identified with the West. The patriarchate of Constantinople was entrusted with the task of safeguarding the Orthodox identity of its members from Islam and from Roman Catholic propaganda. The Orthodox opposition to the Latins was accentuated in this period, as various published and unpublished texts clearly demonstrate. At the cultural level, the impressive development of western Europe in many domains (science, technology, philosophy, economy, and politics) created a serious feeling of inferiority in the East. This was more conspicuous during the 18th century when "the enlightened Europe" was promoted by many Greeks as the best model to be imitated. Such an adoration of the West and its progress met with the declared opposition of many Orthodox, who severely criticized the developments in the fallen and heretical West and tried to compensate for Greece's multiple deficits. Two main anti-western strategies put the emphases on the accomplishments of the ancient Greeks and on the possession of Orthodoxy, i.e. the sole true faith in the entire world. Anti-western views reached their peak when several Orthodox circles tried to legitimize the Ottoman rule with religious arguments, claiming that God intended in this way to protect Orthodoxy from potential submission to the Latin West. Greece's closer contacts with the West and their allegedly fatal consequences for Orthodoxy were thus strictly criticized.

Anti-western attitudes have also been evident since the foundation of the Greek state. In the reign of the Bavarian king Otho (1833–62) there was a systematic attempt to westernize the country in all domains, including the religious one, through the Church's subjection to the state. This enforced process of westernization signified a serious rupture in the Greek historical consciousness and caused a deep cultural schism. There were several indigenous reactions to the dependence on the West, which were manifest both in the thought of individuals (e.g. Y. Makriyannis) and in various socio-religious movements (e.g. of Papoulakos, *c.*1770–1861). In the 19th and 20th centuries this identity crisis also led many Greeks to propose various alternative ways of modernization on the basis of their own heritage (e.g. Eastern Orthodox communalism vs. western individualism). This was a reaction against the wholesale adoption of western patterns of orientation and the constant intervention of western powers in Greek politics. These anti-western efforts were mostly unsuccessful, since Greece still oscillates between tradition and modernity. This lack of equilibrium is the principal cause of various contradictory phenomena in modern Greece, including those of xenomania and xenophobia.

Despite Greece's membership of the European Union, anti-western and even anti-European sentiments are still common in the country in various open and disguised forms. These may be observed in the political arena, for example among the Communists for ideological reasons or among the Socialists of PASOK under A. Papandreou (1981–89), who promised Greeks an independent and nationally dignified foreign policy, away from western European and American interference. Papandreou was also very critical of Greece's membership of NATO and the EU. There exists also a religious anti-westernism, usually among Orthodox fundamentalists, who use the incomparable superiority of Orthodoxy as a defensive mechanism against the heretical West. Anti-western feelings have also been evident among Greek intellectuals of various persuasions (e.g. the generation of the 1930s, the Neo-orthodox current, several leftist groups), who tried to recover Greece's own heritage from the adulterating western influences and to construct a feasible Greek identity in the modern competitive international environment. There exists finally a popular, wide, and diffuse anti-westernism among various population strata for many reasons (e.g. social, psychological, political). However, because the entire Greek society is deeply permeated by western ideas, lifestyles, and consumerist spirit, the Greek public shows a simultaneous love and dislike for these multifaceted influences. This attests to the profound orientation problems that characterize modern Greek society and its ambivalent attitude towards the West.

In Huntington's schema Greece can be described as a "torn country". Its political and economic elites are pro-western, but its history, culture, religion, and tradition are essentially non-western. Its enforced westernization has not so far produced the anticipated results but created additional structural problems that are still evident. However, if Greece redefines its cultural identity, it will modernize itself without rejecting the central elements of its indigenous culture. Such a road to an autonomous, syncretic modernity may mitigate to a considerable degree anti-western sentiments and attitudes and finally lead to a healthier relationship with the West.

Antiquity, Reception of

Hellenic culture is the product of a complex and sometimes problematic relationship with its ancient past, cultural and linguistic. From late antiquity to the modern era an emphasis on continuity with the Classical tradition has been seen as a way of maintaining and expressing ideals of Hellenic identity and unity, marked particularly when these ideals have been perceived as being under threat from "alien" hegemonies – the Roman empire, the Tourkokratia – and in times of national reunification and reinvention.

In antiquity itself the Greeks cherished and derived inspiration from their cultural heritage and sought to gain prestige through establishing ancestral connections, communal and personal, with the gods and heroes of myth. It was the Greek writers and scholars of the Hellenistic world and the early Roman empire, however, who laid the foundations for subsequent attitudes to antiquity in the Greek-speaking world. The intensive scholarly enterprise of the Hellenistic age, focused around the great libraries – particularly that of Alexandria where the gathering and editing of ancient texts and fragments were prioritized as the proper object of academic energy – not only preserved the culture of high antiquity for the future but also provided a model of activity for later scholars. This retrospection extended to the Alexandrian literati who displayed their erudition in sophisticated treatments of esoteric myth and a familiarity with earlier genres, dialects, and metres; following the Hellenistic model, the notion that the literature and language of earlier antiquity were the proper exemplars became a standard for later writers.

The Greeks of the early Roman empire exhibited a more pronounced nostalgia for the past; the literary renaissance of the 2nd and early 3rd centuries AD, dubbed the Second Sophistic by Philostratus, was informed heavily by the culture of Classical Athens (designated as the First Sophistic). The orators Herodes Atticus and Aelius Aristides took Classical rhetoric as their model; the travel writer Pausanias sought to describe Greek culture before the Roman conquest; while Phrynicus produced a lexicon of "correct" vocabulary predicated on Classical usage and the notion of ancient Greek as a linguistic and cultural ideal. This "Atticism", a Classicizing and archaizing written style distinct from the developing spoken Greek language, became a marker of the educated elite and a potent ideological symbol of the continuity between past and present which persisted through the Byzantine period and into the 20th century.

The Greek language which had become the koine of the Hellenistic world remained the lingua franca of the Byzantine empire, an important factor in the reception of antiquity by Byzantine writers and scholars, for whom the literary tradition of ancient Greece was central. Writers of the 5th and 6th centuries AD were well acquainted with the literature of antiquity and this familiarity informed their own work: Homer and Aristotle were particularly important exemplars, while Procopius in the early 6th century was influenced by Thucydides and Herodotus and wrote in the language of his Classical models. The problematic 7th and 8th centuries represented a hiatus in Byzantine literary enterprise, but from the late 8th century the focus of scholarly interest was the reaccumulation and re-editing of the ancient texts and fragments that

had been lost in the preceding period; the 9th and 10th centuries saw the production of the *Suda* and Photios's *Bibliotheca*. In the 7th–11th centuries Roman rather than Hellenic antiquity provided the literary model for Byzantine writers, although the copying of Classical texts and scholia continued. In the mid-11th century, however, there was a renaissance of interest in the culture of ancient Greece during the reign of Constantine IX Monomachos. Classical Greek texts were revered particularly, and the Classical revival was marked by a resumption of scholastic endeavour. Noted Classical scholars such as Michael Psellos and John Italos in the 11th century and John Tzetzes and Eustathios of Thessalonica in the 12th did not confine themselves to the copying and editing of ancient manuscripts but became the self-appointed exegetes of the Classical tradition, writing essays and commentaries in a broadly "Classical" style, albeit from a Byzantine perspective, and using ancient texts to reflect upon contemporary and often ecclesiastical issues. During the Palaiologan period (13th century on) there was a revival in Classical philology and many Greek texts owe their survival to the efforts of Planudes in the 13th century and Triklinios in the 14th. Yet antiquity did not have a monopoly of influence upon the Byzantine literati; the histories of Anna Komnene demonstrate a high Attic style but take the Second Sophistic and late antiquity as models as well as the Classical period, while in the Palaiologan period Byzantium was influenced too by the literature of the medieval West, and much of the religious literature of the empire – in particular the hagiographies and hymnographies – owed nothing to the ancient tradition.

There existed within the Church an equivocal attitude towards the culture of antiquity. From the time of Constantine the term Hellenic (*Hellenikos*) was equated with paganism and was construed as a rival to Christianity; the Church preferred the plainer koine to the "pagan" high Classical style of secular literature and repudiated the polytheism and "immoral" gods of ancient mythology. Indeed in the 10th and 11th centuries any involvement with the myth and philosophy of antiquity invited the charge of anti-Christian behaviour; long ago Justinian had tried to suppress the philosophical schools at Athens, and in the mid-11th century the Platonic and Neoplatonic researches of John Italos were denounced as heretical. Yet paganism proved difficult to eradicate: the cult of Dionysus in particular gathered strength in the period of late antiquity, as evidenced by Nonnus' epic *Dionysiaca* of the mid-5th century, while Christian converts used the mythical iconography of ancient Greece in their churches and incorporated elements of the outlawed pagan worship into the new religion. Furthermore, the literature, philosophy, and rhetoric of Greek antiquity were integral to Christian thought and education: the distinction between the repudiation of Hellenism as paganism and a reverence for the secular literature of Hellenic antiquity was an uneasy one.

The 19th century saw the coincidence of two factors that were highly significant with regard to the reception of the Classical tradition – the revival of Classical scholarship in Europe and the emergence of an independent Greece. The influence of European interest in Greece and the many important archaeological finds impressed upon the Greeks the value, artistic, historical, and commercial, of their past. A series of measures that aimed to preserve the Greek heritage were taken in the first half of the 19th century: in 1826 the provisional government issued a decree for the protection of antiquities, and three years later the fourth National Assembly at Argos prohibited their export, and the first archaeological museum in Greece was founded at Aegina. However, many important artefacts had been taken already, for example the friezes from the Parthenon and Bassae, still in London, and the sculptures from the temple of Aphaea on Aegina, now in Munich. The recovery of antiquities is still a political issue in Greece and a focus of national pride.

When the seat of the new government was moved to Athens the city was rebuilt in the Neoclassical style, and between 1834 and 1837 the Acropolis was "cleansed" in an attempt to restore the purity of the Classical past. Indeed, an emphasis on cultural continuity and "purity" became the keynote for a Greek nation that had survived Ottoman domination and its concomitant cultural and linguistic "contamination": Greek identity was to be reconstructed on the foundations of ancient Hellenism and the image of a new philhellenic Greece entering a new Periclean age. The literature of the period is indicative of this classicizing enterprise: Konstantinos Paparrigopoulos's *History of the Greek Nation* (1860–72) stressed the continuity of Greece from antiquity to the modern era; Adamantios Korais (1748–1833) edited a series of Classical texts, and Philippos Ioannou composed verse in Classical metres – the emphasis was on the perpetuation of the Classical tradition and an archaizing purity of language. Classical studies became the basis of education (as indeed was the case throughout Europe); the University of Athens, founded in 1837, emerged as a bastion of linguistic archaism while the syllabus laid down for the "demotic" schools in 1883 concentrated on the rote learning of Classical texts and the study of ancient Greek.

One primary educational and political concern was the question of a national language; the members of the new Greek state spoke a variety of dialects and languages, including Turkish, and the notion of the standardization of Greek and what form it might take occupied thinkers and politicians for much of the 19th and 20th centuries. One school of thought held that the national language should reflect the tradition of ancient Greece and Byzantium and that Greeks should speak the language of antiquity or at least a "corrected" form of contemporary Greek. In the view of such "archaizers" a knowledge of ancient Greek would give the people access to their cultural inheritance and the translation of ancient texts into the vernacular represented a degradation of the past. Contrarily, others argued that the national language should reflect contemporary Greek linguistic practice and culture. For these "demoticizers" ancient Greek was incomprehensible to ordinary people and its study was available only to the privileged few; thus the prioritization of the learned Greek of antiquity over the modern, demotic language was an elitist anachronism, a socially divisive programme that would separate the people from their heritage. The translation of ancient texts and the performance of ancient drama in demotic Greek was supported in particular by Kostis Palamas (1859–1943); however, feelings regarding the "bastardization" of ancient culture ran so high that a performance in 1903 of Aeschylus' *Oresteia* in a vernacular translation resulted in a riot. The "language question" has informed the political ideology of

both left and right and has persisted well into the 20th century; while the Venizelos government introduced the teaching in schools of demotic Greek in 1917, it was not until the Education Act of 1976 that it was decided that the language of education should be modern Greek.

Many modern writers have felt that an artificial "corrected" form of Attic Greek and a "fossilizing" approach to ancient culture are not only reactionary but also a bar to poetic creativity – Dionysios Solomos (1798–1857) in particular was a champion of demoticism, and the vernacular is now the literary as well as the spoken norm. However, much modern Greek poetry is informed and inspired by antiquity: Solomos, while imbued by the Italian tradition, was influenced by Platonism, as was Palamas. Angelos Sikelianos (1884–1951) too was interested in Plato and in ancient mystery religions, while the "historical" poems of Constantine Cavafy (1863–1933) are set in Hellenistic Alexandria and Byzantium. Yet perhaps the cultural genre of antiquity that appeals most to the contemporary cultural imagination is 5th-century BC drama. There have been many European productions of Greek tragedies from the 16th century on throughout Europe (see Burian, 1997), nearly all of them in languages other than Greek, but during the 20th century in particular there has been a revival of interest in the drama of antiquity in Greece itself and a reintroduction of the ancient notion of the dramatic festival: in the 1920s Sikelianos instituted a cultural festival at Delphi, staging Aeschylus' *Prometheus Bound* and *Suppliant Women*, and in the mid-1950s festivals of ancient drama were instituted at Epidaurus and at the Odeum of Herodes Atticus in Athens. Some modern productions have aimed at authenticity; Sikelianos derived the costumes and movements of the chorus from ancient vase paintings for his staging of Aeschylus, while the film maker Michalis Cacoyannis's *Trojan Trilogy* (1961–76) used ancient sites and costumes. However, tragic performances by Karolos Koun's Theatro Technis are informed by modern Greek rituals and there have been several modern treatments of ancient drama that not only use contemporary settings but also use the narratives of antiquity to explore contemporary issues. Jules Dassin's screen adaptation of Euripides' *Hippolytus* (1961) is a critique of Greek high society – Theseus is transformed into a shipping magnate; Hippolytus dies not in a chariot but in an Aston Martin; and Phaedra, played by Melina Mercouri, overdoses on sleeping pills. More recently the fratricide and divided loyalties of Sophocles' *Antigone* were staged by Nikos Koundouros in the no man's land between northern Greece and the former Republic of Yugoslavia.

Translations of ancient texts into modern Greek and new media such as film have engaged a wider audience. Poets, theatre directors, and film makers have taken antiquity out of the museum and classroom and into a wider public arena, reinstating ancient literature and thought as part of the living tradition of Greece and as an integral part of contemporary Hellenic culture. Yet while an engagement with antiquity may be a source of inspiration to its inheritors, the achievements of the past may also provoke what has been called the "anxiety of influence": in the Palaiologan period the scholar Theodore Metochites complained that there was nothing left to say – the ancients had said it all; in the 20th century George Seferis, for whom Greece's ancient ruins signified the sterility of the modern imagination, intimated that the sheer weight of a glorious cultural inheritance could be a burden as well as an inspiration: "I awoke with this marble head in my hands" (*Mythistorema*, 3).

Antisemitism

The modern-day equation of Greekness with Orthodox Christianity is one that is often assumed by Greeks and non-Greeks, by government and Church officials alike. We would be well advised, however, to bear in mind that long before there were Greek Christians, there were Greek Jews, for despite present constitutional guarantees regarding freedom of religion, and the legal separation of Church and state, in the modern era it has been very easy to assume that Orthodoxy is essential to Greekness, and Greekness somehow essential to Orthodoxy. Obviously, such an assumption is not tantamount to outright antisemitism, but the close relationship between Orthodoxy and Greekness has at many times in the modern period borne undertones of antisemitism, and has provided a potentially alienating and dangerous environment for Greek Jews.

Although this equation of Orthodoxy and Greekness is now pervasive and established, if one considers the historical sweep of the Hellenic tradition, it is also a relatively late development. Judaism first became a feature of the Greek world during the Hellenistic period. The relationship between Hellenism and Judaism was both consolidated by, and reflected in, the translation of the Jewish scriptures into Greek (270 BC). With the accession of the Seleucid king Antiochus Epiphanes in 176 BC an aggressive policy of Hellenization of Jerusalem and the surrounding regions furthered the development of a strongly Hellenized Jewish population. When revolt broke out in Judaea, Antiochus imposed a number of policies designed specifically to control and subdue the Jews. Circumcision was forbidden, worship of the Judaean God outlawed, and the Temple desecrated.

Thus there were already tensions early on in the history of Graeco-Jewish relations. To characterize them, however, as simply reflective of Greek antisemitism would be both anachronistic and lacking in interpretive subtlety. For although it is in the Hellenistic period that we find the first clash between Greekness and Jewishness, far more important is the fact that it is then that we also see the union, in many significant ways, of these two cultural concepts, and the expansion of both as a result of this union.

Thus it is that long before the advent of Christianity, Hellenism and Judaism came in contact with one another, became to some extent syncretized, and developed a familiar, if at times uneasy, coexistence. The rise of Christianity, a form of which has since come to be regarded as almost synonymous with "Greekness", long postdated this symbiosis between the two traditions, and had to negotiate its way between them.

In order to talk with any real accuracy of something specifically designated as "antisemitism in the Hellenic tradition", one needs to jump far ahead, to the Tourkokratia, if not modernity. For even during the Byzantine period, when the union among imperium, Orthodoxy, and the Hellenic linguistic and philosophical traditions was at its height, the fundamental assumption was nevertheless of a culture that was religiously and ethnically heterogeneous. It would still in this period be grossly anachronistic and heavy-handed to speak of antisemitism as a distinctly Greek phenomenon. The Jews of Byzantium, like those of western Europe in the period, were certainly subject to persecution, invasions, and various other hardships, but such events were a sad product of the general antisemitism so prevalent throughout the Christian world in the medieval period. In comparison to those in western Europe, the Jews of Byzantium fared relatively well.

While during the Byzantine era Greek Jews constituted a minority community within an empire that defined itself as Greek and Orthodox, during the Tourkokratia all Greeks, Jewish and Orthodox alike, were the minority subjects of a potentially hostile empire. It is therefore not surprising that it is during the Tourkokratia, when the Greek community had self-consciously to consolidate, preserve, and propagate its distinct cultural identity, that we find the first clear articulations of Greekness (as an ethnic category) and Orthodoxy as being somehow fused inseparably together. As the dominant Greek "minority" community (albeit a very sizeable and influential one), the Greek Orthodox polity came to bear sole responsibility, and ultimately establish hegemony, as the propagator of Hellenism. The period of Turkish rule gave rise, through the influential role granted to the Orthodox Church by the Ottoman regime, to a form of Greekness that was suffused with Orthodox Christianity. Thus it is that during the Tourkoratia we also first find the origins of what might with some accuracy be identified as a tradition of Greek antisemitism. The rise of an assumed cultural ideology whereby the Orthodox Church was the primary, indeed virtually the only, transmitter and repository of Hellenic tradition came to bear strongly antisemitic undertones.

Outside the most heavily Jewish Ottoman territories, such as Thessalonica, Greekness was articulated primarily through the vocabulary of Orthodoxy. The Greek language and the Greek educational, legal, and fiscal systems were all under the jurisdiction of the Orthodox Church. As a result of this fusion between religious and political and other secular functions, Judaism came to be regarded as inimical to true Greekness. The articulation of a form of Greekness that did not strive to accommodate or include Judaism is clearly a form of Greek antisemitism, one that was strengthened with the establishment of the Greek nation state, and furthered during the modern period.

With the creation of the kingdom of Greece in 1834, following the protracted battle for Greek independence, Jews in Greek lands found themselves in an environment potentially far more alienating than the Ottoman empire had been. The new Greek state articulated itself as strongly Orthodox in character, despite the fact that the Orthodox Church itself was placed under a significant degree of governmental control. The result was that Jews were regarded as not being truly Greek. This contributed significantly to the increasing isolation of Greek Jews from broader Greek society, an isolation both cultural and geographic that made them all-too-easy targets when the Holocaust spread to Greece. Paradoxically, however, in the decades immediately prior to the Holocaust, the overall status of Greek Jews had been gradually improving.

When in October 1940 Greece was brought into World War II, a new and hideous set of tensions was brought to bear on the Greek Jewish communities. On the eve of the war it is estimated that there were some 75,000 Jews living in Greece; at the end of the war, following repatriation, there were fewer than 10,000. The role played by antisemitism in this process is all too evident. It is far more difficult to address the question

of the possible role of a distinctly Greek antisemitism in the eradication of Greek Jewry. As is well known, the Greek chief of police Angelos Evert provided Greek Jews with false identification papers in an effort to protect them from the Holocaust, and archbishop Damaskinos made repeated interventions with both the Greek government and the German authorities on their behalf.

The official Church position regarding Judaism has always condemned antisemitism, and Judaism's vital contribution to Christianity is respected and recognized. Nevertheless, over the years many Church officials have published or publicly spoken on strongly antisemitic themes. Such antisemitism often takes the form of a conflation of Zionism with Judaism, and in fact what in many instances is referred to as Greek antisemitism is much more appropriately referred to as Greek anti-Zionism. Much Greek antisemitic rhetoric assumes Zionism and Judaism to be one and the same thing, and accuses Jews of being anti-Greek or dangerous to the Greek state because of the supposed support of all Jews for the Zionist cause. In its most hysterical and hyperbolic form, such rhetoric argues that all Jews have loyalty only to a "world Zionist state" (that is, Israel), and is based on the belief that Israel has world domination as its goal. Such formulations are dangerous in the extreme, for they both discredit legitimate political positions (by making them seem specifically anti-Jewish) and syllogistically and inaccurately convert all Jews into Zionists. That Greece's stance on the Palestinian problem has been distinctly anti-Israeli is certainly not evidence that Greece is in some fundamental way antisemitic. Nor is the fact that some Greeks are Jews any sort of evidence whatsoever that they consider themselves to be anything other than Greek, or that their "true" loyalty is to the state of Israel.

Not surprisingly, the routine equation of Zionism and Judaism has led to outbreaks of anti-Jewish propaganda and activity that correspond to political events in the Middle East. Following the Israeli invasion of Lebanon in 1982, for example, articles in the mainstream Greek press referred to Israelis as "Nazis", and the "descendants of Hitler". The reception of such statements in Greece, where little care has been taken to distinguish between Israel, Judaism, and Zionism, has been one that has helped to sustain and perpetuate various forms of antisemitism. The recent strengthening of diplomatic and military ties between Turkey and Israel has contributed to the lack of subtlety in distinguishing between the various issues, although the situation has improved somewhat since prime minister Mitsotakis recognized Israel in 1990.

Perhaps most troublingly, such sweepingly inaccurate rhetoric distracts attention from the other, far less overt forms of antisemitism that are still present in a society that has for hundreds of years in many ways equated Greekness with Orthodox Christianity. The Greek educational system still places a heavy emphasis on Christian education, little effort is made to explore and teach the history of Greek Jews, and Greece's numerous if small extreme right-wing organizations, publications, and political parties have for the most part been dealt with leniently by the Greek legal system. Some acts of antisemitic violence have been reported, although in comparison to other European nations they are relatively few. In 1987 a Volos synagogue and several Jewish-owned stores were vandalized; two years later a Jewish memorial at the Lianokladi railway station in Thessaly commemorating victims of the Holocaust was smashed; routinely at international sporting events Israeli teams are jeered at in neo-Nazi rhetoric.

A survey of 1988 reported, depressingly, that fully 71 per cent of Greeks report holding a "somewhat or strongly unfavourable" view of Jews. This fact notwithstanding, the Greek government for the most part is exceedingly hesitant to acknowledge antisemitism as a real problem in Greek society. To some extent this is the intentional turning of a blind eye, but to a large degree it can been seen as the response of a society that is dramatically homogeneous in its ethnic makeup and thus unskilled at dealing with the pressing issues of pluralism and tolerance. The very things that have historically given rise to Greek antisemitism – the linkage between Hellenism and Orthodoxy, and the ethnic homogeneity of Greek society – have, alas, also been the very things that have made Greece ill-equipped to deal with it.

Apelles

Painter of the 4th/3rd century BC

Apelles was the most celebrated and the most written-about painter in antiquity, yet we know neither his date of birth nor his date of death. However, his likeable and colourful personality, his rivalries with others, and his special relationships with the most powerful men of his day have generated many anecdotes about the man, the artist, and his works. He attained remarkably high social and economic status, and wrote treatises about his painting. Unfortunately, neither his writings nor his famous creations survive. All we have are anecdotes, the mention of more than 30 titles of his works, perhaps a few very vague and suspect reminiscences in Roman paintings, and a few elaborate literary descriptions, the last of which formed

the basis for attempted recreations of his works by Renaissance artists.

Born sometime around 370 BC, in either Cos or Colophon, Apelles first trained in the Ionic school under Ephorus of Ephesus. He then moved to the Greek mainland, paying a large sum for the privilege of becoming the student of Pamphilus, the master of the Sicyonian school. Combining the grace of the Ionic style with the thoroughness of the Sicyonian school, Apelles attained a reputation that by *c.*340 BC was sufficiently prominent to gain him entry to the court of Philip II in Macedonia, where he painted portraits of the ruler and his court. During the reign of Alexander the Great, Apelles' affable nature and abilities as a painter advanced him to the point where the ruler made him his official portraitist. Apelles joined the ranks of the sculptor Lysippus and the engraver Pyrgoteles as the only artists officially allowed to depict Alexander. The latter was attempting, it seems, to develop his official portraiture, and to control the quality, and messages conveyed by, his images.

Apelles' easy relationship with Alexander and his associations with other powerful rulers and commanders made the artist's reputation. His works fetched extraordinary prices and were avidly collected. His portrait of *Alexander as Zeus Keraunophoros* [the Thunder-Bearer] for the temple of Artemis at Ephesus fetched 20 talents; his *Aphrodite Anadyomene* [Rising from the Sea], intended for the temple of Asclepius at Cos, was eventually taken by the emperor Augustus in exchange for remission of a 100-talent debt.

Apelles' works included a variety of subjects: historical portraits of Philip, Alexander, Menander (satrap of Caria), and Antigonus Monophthalmus; such figures as philosophers, men of letters, actors, and priests; elaborate allegories; personifications; and naturalistic renditions of animals. He even painted a self-portrait, perhaps the first of antiquity. The most famous portraits were those of Alexander. Whereas it was Lysippus who appears to have been chiefly responsible for the development of a heroic image of Alexander, Apelles (and perhaps also Pyrgoteles) created a superhuman image and divine personality which were more suited to the needs of an Alexander who was the ruler of a great and unified empire. *Alexander as Zeus Keraunophoros* had obvious religious and political overtones for the new empire. Some details of the painting are recorded (see below) though even the subject's basic pose is not described: perhaps Alexander was seated on a throne following Phidias' *Olympian Zeus*. The painting of Alexander in the house of the Vettii at Pompeii may reflect some of Apelles' influence.

Of Apelles' numerous portraits of Alexander, two others are notable for conveying the elevated status of the ruler: *Alexander in the company of Nike and the Dioscuri*, and *Alexander in a Triumphal Chariot* with the personification of War (Polemos) with bound hands. Such overt imagery was useful to later rulers, accounting for the prominent display of both paintings in the Forum of Augustus in Rome. Associations with that ruler were made even more directly when Claudius had Alexander's features replaced by those of Augustus. By creating such portraits of Alexander, Apelles breached the divide separating the human from the divine, making the deification of mortals much easier for later artists and rulers.

Of Apelles' allegorical paintings, his *Calumny*, created after he had been slandered and subsequently cleared at Ptolemy's court in Alexandria, is the most famous. Lucian (*Calumny*, 4) provides both the context and description for the work, which has been cited as the only known example of painted satire in antiquity. Several Renaissance artists (among them Dürer and Botticelli) attempted to capture the essence of the lost work using only Lucian's words.

The *Aphrodite Anadyomene*, Apelles' most famous painting, also inspired Renaissance artists. According to one tradition, Apelles had fallen in love with Alexander's mistress while painting her portrait. When he realized what had happened, the king gave her to Apelles, who then used her as the model for the *Anadyomene*. The story fits well with other information about his relationship with Alexander and with his reputation as a naturalistic painter of great talent. The painting was eventually displayed by Augustus in the temple of Julius Caesar, where it would remind viewers of Caesar's claim of descent from Venus-Aphrodite.

Some of Apelles' more elaborate concepts of abstract personifications included depictions of *Thunder* (*Bronte*), *Lightning* (*Astrape*), and the *Thunderbolt* (*Keraunobolia*). All probably were examples of his experimentation with lighting effects, which are recorded or surmised for other paintings. Lucian states that studied gradations in colours were used in the faces of the *Calumny* to distinguish its personifications. Lighting technique may also account for the three-dimensional effect of the fingers holding the sparkling bolt of lightning in the *Keraunophoros*. The suggestion that Apelles increased the brightness of the bolt to make it stand forth by darkening the figure of Alexander provides a hint of what his experimentation might have accomplished.

He is praised continually for the amazing realism of his works. His portraits were said to be so perfect that a physiognomist was able to determine the subject's age and how much longer he had to live. As with earlier painters, stories developed in which animals became judges of paintings, and were unable to distinguish between painted images and reality. When Apelles, entered in a contest to paint horses, realized that a conspiracy had already decided the outcome, he had real horses brought in to prove his skill by their neighing only at his work. As a general attribute of great artists, such comments about naturalistic renditions tell us little about the painters, but often allow other deductions.

The stories about Apelles seem to indicate that he concentrated on human and animal subjects rather than scenery and incidental detail. Nor does he seem to have been much concerned with elaborate perspective, although some of his works imply an interest in foreshortening. He painted an oblique portrait of Antigonus Monophthalmus, so that only his good eye would be visible, and a Heracles seen from behind.

Anecdotes about his friendly rivalry with Protogenes, another important painter, reveal some of Apelles' other techniques and interests. The two painters probably refined the skiagraphic technique (shadow painting), raising it to a new level. The contest in which they vied with one another in drawing a finer, steadier line reveals the importance of manual dexterity and control, which, in conjunction with the daily drawing practice of Apelles, serves to emphasize his probable

belief that these skills were the foundations of his success. Naturalistic illusion through fineness of line seems to have been the key to Apelles' approach to painting.

His skill also was reflected by his use of only four colours. The technique had been in use for some time, but was probably brought to its acme by Apelles, whose fame inspired Renaissance artists to attempt to emulate his success with the restricted palette. The use of few colours and his eschewing of elaborate perspective and scenery made his simplicity of design, his beauty of line, and his charm of expression his chief merits.

In addition to his advances in artistic style and technique, Apelles also developed some sort of transparent varnish, a dark glaze (*atramentum*) that preserved the paintings and softened the colours, perhaps adding to the naturalism of the subject. Attempts to rediscover this substance have failed.

Unlike most other artists, Apelles was unusually receptive to criticism from all quarters, though he was also quick to counter undeserved criticism, whether from a ruler of Alexander's stature or a common cobbler. The story of him hiding to hear criticisms of his works from people in the street, and then altering his paintings accordingly, fits well with his acknowledgements of other painters' abilities: Melanthius spaced his figures better, Asclepiodorus had better symmetry and proportions. Apelles believed himself the painter who excelled all in grace or charm (*charis*). His peers, his clients, and Roman emperors and nobles not only agreed, but regarded him as the best painter of antiquity. Scholars and artists since the Renaissance, intrigued by his reputation and descriptions of his paintings and techniques, have tried in vain to recover his genius.

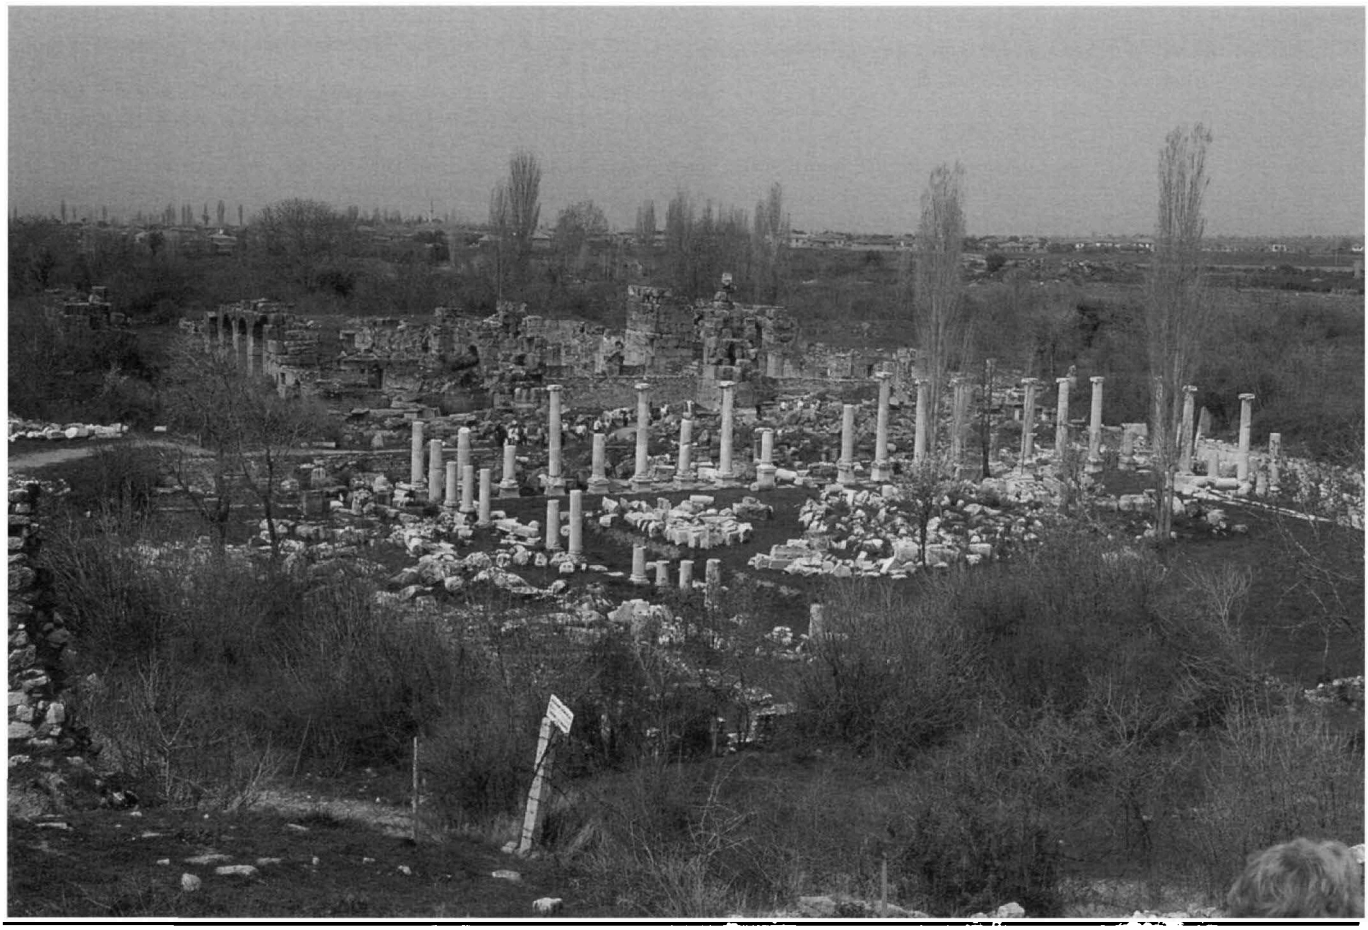
Aphrodisias

City in Asia Minor

Aphrodisias, an ancient city of Caria in Asia Minor (now Geyre in Turkey), is located about 240 km southeast of Izmir (formerly Smyrna) in a fertile plain with a good supply of spring water. The site was inhabited by the late Neolithic period; in the 4th millennium BC a prominent settlement was established and continued to exist there throughout the Bronze Age. Already in prehistoric times a fertility goddess was venerated at the site. As the fame of the local goddess, called Ninoe, gradually spread, a settlement with a sanctuary and a surrounding area under its protection was founded in the 1st millennium BC. Although a vigorous community developed during the Archaic period, one cannot speak of the existence of a city at this time.

Until the Hellenistic period Aphrodisias remained a sacred site with a sanctuary, associated, perhaps from the 3rd century BC, with the Greek goddess Aphrodite, after whom it was named, as indicated by coin inscriptions of the late 2nd and early 1st centuries BC. Its transformation into a city seems to be connected with the establishment of Roman power in western Asia. Although excavations on the site were undertaken at the beginning of the 20th century, it was not until 1961 that Aphrodisias began to be systematically excavated. The site is notable for its extensive and well-preserved monuments.

With the arrival of the Romans in Anatolia Aphrodisias flourished, largely because of its close relationship with Rome



Aphrodisias: an ancient city in western Asia Minor recently brought to life by the excavations of Kenan Erim

and especially with the family of Caesar. Thus Aphrodisias resisted Mithridates VI in 88 BC and the "Liberators" – Brutus and Cassius – after Caesar's death. In 40 BC Labienus, one of their supporters, attacked Aphrodisias and both the city and the sanctuary were plundered before Antony defeated him (39 BC). Thereafter Aphrodisias lay in Antony's sphere of influence. At this time the name of Aphrodisias appeared on coins together with that of the neighbouring city of Plarasa. In 39 and 35 BC Antony sent a senatorial decree to Aphrodisias, in which the Plarasians and Aphrodisians were addressed as citizens of the city, which presumably resulted in the unification of the two cities. The decree guaranteed Aphrodisias its freedom as well as certain special privileges, such as a non-taxable status and asylum rights to the sanctuary of Aphrodite. During the Roman empire the population reached 50,000, and the city enjoyed a long period of prosperity and was transformed into an important cultural, religious, and artistic centre.

The city was laid out according to the Hippodamian town planning system and in the second half of the 3rd century AD a fortification wall, *c.*3.5 km long, was built around it against the threat of Gothic invasions. Elaborate buildings, such as the theatre, the tetrastoon, the agora, the baths of Hadrian, the Sebasteion, the odeum, the temple of Aphrodite, and the stadium (which could seat almost 30,000 spectators) were erected in Aphrodisias during Roman times. Traces of a gymnasium complex and a sculptor's workshop have also been recovered.

The theatre of Aphrodisias, one of the best preserved in Turkey, was built in the second half of the 1st century BC. It remained in use during the early Byzantine period and could hold around 8000 spectators. The wall of the north parodos was discovered to be lined with inscriptions and was thereafter referred to as the "archive wall". These documents – mostly letters – form a unique record for the history of Aphrodisias and of Roman Asia Minor.

To the southwest of the temple of Aphrodite stood a residential complex of the 3rd century AD. The building consisted of several rooms and halls and a peristyle court decorated with blue marble columns. Originally this may have been a private dwelling of a high Roman official, but in the Byzantine period it was the bishop's palace. A similar building, constructed in the 3rd century AD to the north of the temple of Aphrodite, is identified as a school of philosophy, which in the 6th century AD was used as a residence.

Aphrodisias became famous as a centre for medicine and philosophy. Xenocrates composed his medical treatises here, while the philosophers Alexander (one of the best commentators on Aristotle) and Adrastus originated from Aphrodisias. Statues, reliefs, and sarcophagi were produced in the sculpture workshops of Aphrodisias for local use and export. Local sculptors gained fame, and their signatures are found in many regions of the Mediterranean; their craftsmanship was appreciated even in Rome, and a school of sculpture was founded which lasted to the end of the 5th century AD. The sculptors

managed to give new meanings to Classical models and did not limit themselves to mere reproduction of well-known works of Classical art. The marble quarries in the vicinity of Aphrodisias were a source of white and dark marbles. Sculpture competitions were also held in the city.

In the 3rd century AD changes in the administration of the Roman empire affected the privileged status of Aphrodisias, which was considered part of the province of Asia. After the formation of a new province of Caria and Phrygia in the 250s, Aphrodisias probably became its administrative centre. Under Diocletian (284–305), it was the capital of the separate province of Caria.

With the spread of Christianity Aphrodisias became the seat of an archbishop in the 4th century and the temple of Aphrodite was transformed into a triple-naved basilica. The earliest known Aphrodisian bishop is Ammonius, who participated in the Council of Nicaea in 325. Palaces with audience halls flanked the church. The agora to the south was abandoned after an earthquake in the 4th century, and many public buildings were rebuilt at that time.

In the course of the 5th and 6th centuries several bishops of Aphrodisias became involved in the theological disputes concerning the nature of Christ. Paganism was vigorous in the city throughout the 5th century, but there was also an important Monophysite church. Both pagans and Christians made generous benefactions to the city. The city's name was changed to Stavroupolis [City of the Cross] in the 7th century, but by the 12th century it was commonly known by the name of the province, Caria. An earthquake in the reign of Herakleios (610–41) destroyed many buildings in the city, such as the theatre, the odeum, and the agora gate, which were never repaired. The mound of the theatre was then surrounded by walls and transformed into a citadel, where the population could take refuge in times of danger. The city was sacked by Theodore Mankapas in 1188 and by the Seljuks in 1197. It became Turkish in the late 13th century. Gradually the size of the city decreased until it was no more than a village, called Geyre, a name deriving from Caria and mentioned by 17th-century travellers.

ELENI ZIMI

Summary

City in Asia Minor, known as Geyre today. The site was inhabited in prehistoric times and was the centre of a local cult, perhaps associated with Aphrodite. But Aphrodisias did not flourish as a city until Roman times, when it was granted special privileges. A large number of well-preserved monuments survive and the city became an important cultural, religious, and artistic centre. In the 4th century it became the seat of an archibishop and the temple of Aphrodite was turned into a basilica.

Apollonius of Perge

Mathematician and astronomer of the 3rd century BC

The work of Apollonius of Perge, who was active in the late 3rd century BC, marks the end of the great creative period of Greek geometry. He was the author of a number of mathematical works, including *On the Cutting off of a Ratio* (which survives in an Arabic translation), and we are told by Ptolemy (who quotes one of his theorems) that he did important work on the mathematics of astronomy. His status as one of the great mathematicians of antiquity, however, rests on his *Conica*, a treatise in eight books on the geometry of the ellipse, the parabola, and the hyperbola. The first four books, the only ones to survive in Greek, are described by Apollonius in his preface as an "elementary introduction", and deal with the construction of the figures, their fundamental properties, and a series of theorems on a variety of mathematical relationships; they are modelled, both in their method of presentation and in their organization, on the *Elements* of Euclid. Of the remaining four books, three survive only in Arabic translation, and the fourth is completely lost. They deal with a number of separate additional problems, with little attempt to bring them together into a single system of argument; the quality of mathematical thought in these books (and especially book 5) is very high.

Apollonius himself makes little claim to originality, and it is certainly true that when he wrote his treatise Greek geometers had already been working on conic sections for some time. The

first to do so was probably Menaechmus, in the 4th century BC, as part of his attempt at a solution to the problem of duplicating the cube. Later Euclid wrote a work on conics (now lost), and Archimedes also deals with them, particularly the parabola. Apollonius, however, in suggesting that he is simply compiling and systematizing the work of his predecessors, seriously understates his achievement. Earlier Greek geometers had treated these curves as sections of different kinds of cone, cut by a line perpendicular to one of the sides of the cone. Cutting an acute-angled cone produces an ellipse, a right-angled cone a parabola, and an obtuse-angled cone a hyperbola. What Apollonius did was to show how all of these curves could be generated from sections of a single type of cone, the double oblique cone, thus achieving a much greater degree of generality. He deals with most of the features of conics familiar to modern mathematicians, and where he omits some (as, for example, the focus of the parabola) it is more likely that the reason is that he was trying to write an elementary treatise, rather than that he was unaware of them.

The *Conica* established itself as a sort of supplement to Euclid, and one of the basic texts of Greek mathematics, at a very early date. It was still being studied in the 4th and 5th centuries AD, when it was the subject of commentaries by, among others, Serenus, Hypatia, and Eutocius. The oldest surviving manuscripts date from the 9th century, a period when interest in mathematics was being revived in the Byzantine empire, which perhaps indicates that the *Conica* was still being regarded at that period as a fundamental text.

The 3rd-century AD mathematician Pappus gives brief descriptions of five other works by Apollonius which are now completely lost: *On the Cutting off of an Area*, *On Determinate Sections*, *On Tangencies*, *Plane Loci*, and *Vergings*. Pappus also preserves an extract of a description of a method of expressing and manipulating very large numbers, using 10,000 as base. Other works that are credited to Apollonius are a *Comparison of the Dodecahedron with the* Eicosahedron, a *General Treatise* (on the fundamental principles of geometry), *On the Cylindrical Helix*, a work on unordered irrationals, and the *Quick Delivery*, in which he calculated the value of π to a high degree of accuracy.

Biography

Active in the late 3rd century BC, Apollonius of Perge is best known for his work on *Conics* (of its eight books, four survive in Greek, three in Arabic, and one is lost). His only other surviving work is *On the Cutting off of a Ratio* which is preserved in an Arabic translation. Ptolemy says he also worked on the mathematics of astronomy.

Apollonius Rhodius *c.*295–215 BC

Epic poet and scholar

Apollonius was born at Alexandria (cf. Strabo, 14. 655) or, less probably, at Naucratis (Athenaeus, 7 p. 283; Aelian, *De Natura Animalium*, 15. 23). However, he is generally called the Rhodian on account of his retirement in Rhodes, where he is said to have revised his epic after its supposed initial failure to impress the Alexandrian audience, and, through his poem and his work as a rhetorician, to have won the recognition of the Rhodians and even the citizenship of Rhodes. There is probably an element of fiction in this account, which may have been suggested by the existence of some variants quoted in the scholia, which seem to point to an earlier text. According to his two anonymous biographies (contained in the Laurentian manuscript of the *Argonautica* and probably incorporating material derived from the late 1st century BC) and the *Suda*, he was a pupil of Callimachus, with whom he is said to have quarelled over the merits of long traditional epics over short and highly finished poems. The supposed existence of such an enmity — a supposition based on rather flimsy evidence — is, however, rendered improbable by the many striking parallels in the work of the two poets. According to Oxyrhynchus papyrus no. 1241 (late 2nd century AD), Apollonius followed Zenodotus as director of the library in Alexandria (270–247 BC) and was succeeded by Eratosthenes. The *Suda* puts him after Eratosthenes, no doubt due to a confusion with Apollonius the Eidograph, who is mentioned in the papyrus as the successor to Eratosthenes.

Apollonius' lost works include prose tracts on Hesiod (in which he apparently rejected the *Ornithomanteia* but accepted the *Shield of Heracles* as genuine), Archilochus, Antimachus, and a monograph on Homer entitled *Against Zenodotus* (cf. the Venetian scholia on Homer, *Iliad*, 13. 657), a choliambic poem on Egyptian legends entitled *Canobus*, and *ktiseis* or poems on the origin or foundation of cities (a genre fashionable at the time and reflecting Alexandrian enthusiasm for local history and cult) such as Alexandria, Naucratis, Caunus, Cnidus, Rhodes, and possibly Lesbos. The only surviving example of his epigrams (if the attribution is reliable) is an attack on Callimachus (*Anthologia Palatina*, 11. 275).

He was the first ancient writer to divide his own work into books, and in their number as well as in their length, the four books of his epic follow Aristotle's advice in the *Poetics* (chapter 23) that ideally an epic should be as long as the series of three tragedies and one satyr play presented by each poet at a dramatic competition. The *Argonautica* (which runs to 5,835 lines) narrates how Jason and his followers sailed to Colchis by the Propontis and Black Sea (books 1–2), how he won the Golden Fleece with Medea's help (book 3), and how the ship returned home (book 4).

Among the poet's major literary antecedents may be mentioned the fourth Pythian Ode of Pindar, with its account of the Argonautic expedition, and the *Medea* of Euripides. However, Apollonius' main inspiration is Homer, and this influence permeates almost every aspect of his creation, and is most evident in set scenes. Thus the catalogue of the Argonauts (1. 23–233) corresponds to Homer's catalogue of ships in *Iliad* 2, while the description of Jason's cloak (1. 721–67) has been

suggested by the shield of Achilles in *Iliad* 18. These scenes serve to bring out by contrast the significant differences in Apollonius' poem. The same is also true of individual characters in relation to their Homeric prototypes: compare Jason with Odysseus or Medea with Nausicaa and Circe.

The Hellenistic period was an age of scientific and scholarly achievement, and the Hellenistic poets considered this knowledge as part of their artistic material. In keeping with contemporary trends, therefore, Apollonius brings his scholarship to bear on his composition by explaining the causes (*aitia*) of names, cults, relics, customs, and natural phenomena. The scholia record many of the sources that he so diligently consulted. His learning stresses the significance of the Argonautic expedition as a voyage of acculturation, establishing Greek tradition. It has been suggested that the repeatedly positive evaluation of Greek culture (including cult and mythology) should be connected with the Ptolemaic context of the work, since the Ptolemies promoted themselves as the true heirs and champions of Classical Greek culture (Hunter, 1993, chapter 6).

Apollonius was also the first Greek poet to place love in the foreground of the action in an epic and to study its psychology, thereby creating a new trend in western literature. Although he is dealing with a heroic legend, its central theme is not war but love. The capacity he shows for sympathetic analysis in his account of Medea's love for Jason is something not found in earlier Greek literature, with the possible exception of Sappho, whose work, however, has survived only in fragments. His descriptive power is revealed in the many charming *ekphraseis* (descriptions) with which he adorns his poem, once more in keeping with Hellenistic tradition. He also introduces a number of striking and suggestive similes. These descriptions and similes, as well as his fresh treatment of old episodes, serve to attract the reader.

The principal defect of the poem, according to some modern critics, is its lack of structural unity. In their view, Apollonius fails to organize into a whole his abundant array of erudite material, and too often the narrative breaks into long, disjointed passages. It has been pointed out, however, that discontinuity is Apollonius' principle of composition, and that this principle operates in the organization of the narrative both within the book and between books. Although constructed with great care, especially in its versification, its uniform mediocrity often makes the poem positively tedious. He has also been criticized for weak characterization. His Jason lacks the energy expected of a heroic leader, and lacks sufficient development to attract the reader's interest. In each of the two last books where she appears, Medea, as impressionable virgin and dangerous sorceress respectively, is inconsistent (when seen against Aristotle's requirement of consistency for the dramatic character), though she is beautifully drawn and the gradual growth of her love for Jason is described with a truly artistic moderation.

His hexameters generally follow the Homeric pattern, and so does his vocabulary. However, in keeping with the usage of Alexandrian authors, he continually varies and "interprets" the Homeric words and phrases. His greatest stylistic achievement is in fact the subtle adaptation of the Homeric language to express the romantic sentiments of his own age, but its brevity and conciseness are in marked contrast to the natural and easy flow of the Homeric poems.

The *Argonautica* appears to have enjoyed considerable popularity even during Apollonius' own lifetime, for we hear that contemporaries, such as Charon, wrote commentaries on it. Our present scholia are abridged from the commentaries of Lucillus of Tarrha, Sophocles, and Theon, all of whom apparently belong to the pre-Christian era. There are 52 known manuscripts, and numerous papyri testify to the poem's popularity in later antiquity. There are two sets of scholia: the Florentine and the Parisian. The former were published in the edition by J. Lascaris (Florence, 1496), and the latter were first published in Schaefer's edition (2 volumes, Leipzig, 1810–13) and consist mainly of verbal explanations and criticisms. The scholia also speak of one Eirenaius as the author of a critical and exegetical commentary. During the reign of the Byzantine emperor Anastasius I (AD 491–518), one Marianus paraphrased the *Argonautica* in 5608 iambics. In recent times the *Argonautica* has attracted the serious attention of scholars. Surprisingly, there were no English translations of the *Argonautica* until those of E.P. Coleridge (1889), R.C. Seaton (1912), and E.V. Rieu (1959). However, Between 1990 and 1997, three new translations appeared, by Barbara Hughes Fowler (1990), Richard L. Hunter (1993), and Peter Green (1997).

Biography

Born *c.*295 BC probably in Alexandria, Apollonius is called the Rhodian because he retired to Rhodes, apparently to revise his epic poem, the *Argonautica*, after its poor reception in Alexandria. A pupil of Callimachus, he was director of the Alexandria library after Zenodotus and before Eratosthenes. Lost works include prose tracts on other poets and poems on the foundation of cities. He died in 215 BC.

Apologists, Greek

The precise identification of the individuals who came to be known collectively as the Greek Apologists has been a matter of debate. An average list would contain as many as 12 names: Quadratus, Aristides of Athens, Aristo of Pella, St Justin Martyr, Tatian the Syrian, Miltiades, Apollinaris of Hierapolis, Athenagoras of Athens, Theophilus of Antioch, Melito of Sardis, the author of the *Epistle of Diognetus*, and Hermias. Of these, some are represented by little surviving text, while others may be read at fair length. The *Epistle of Diognetus*, it may be argued, is best treated separately.

As the name implies, these were Christian writers who wrote in defence of their faith, their apologetic directed in the first instance against what were seen as dangerous misunderstandings and calumnies that might affect the treatment of Christians within the empire at large and within local society. Some were supposedly addressed to emperors, though there is no evidence of response. It was seen as essential that Christian communities should be treated not as potentially dissident, but as loyal citizens of the empire, people whose form of worship, though distinctive, posed no threat to private morality or public order. The Christian Eucharist, with its reference to eating a body and drinking blood, was no crude cannibalism but a deeply spiritual expression of unity. Of more lasting significance are those parts of their work in which these writers attempt to face the intellectual criticism, often scorn, that they met or might expect to meet from their educated counterparts. Though they may not emerge as deeply original thinkers, they show some acquaintance with current thought patterns as they had been traditionally developed, and they are able to engage with ideas that might either be demonstrated to have affinities with Christian teachings or to be inimical to them. They saw their task as setting out as clearly as they could, in debate with Jews or pagans, lines of continuity, while preserving what they regarded as the inalienable uniqueness of their belief. The Apologists try to isolate fundamental points of monotheistic faith or philosophical tenets that tend in their direction, particularly where there is a Platonic angle to be examined. A writer such as Justin, who feels committed to fighting on two fronts, hoping to win acceptance in the philosophical schools through which he claims to have successively passed and equally among people of the Jewish faith from which Christianity had emerged, engaged in a formidable undertaking. While there are tedious and ill-considered tracts in, say, Tatian, there are also fascinating insights into skills of communication. Whatever success, or lack of it, we are to attribute to the Greek Apologists in their own time, we cannot doubt the influence they had on later Christian writers, setting a pattern of reasoned debate, rather than wilful isolation.

Of Quadratus only a fragment survives, quoted by Eusebius, dated around 124. If we accept the statement of that same historian, we would take Aristides to be the earliest whose *Apology* survives, and, indeed, the Syrian and Armenian texts on which our knowledge is based are prefaced by the statement that it is addressed to Hadrian (emperor 117–38). It is, however, more likely to be later, written during the reign of his successor, Antoninus Pius, perhaps *c.*140. If so, it would retain its place as the earliest surviving apology. Aristides attempts to preserve a cool tone. While maintaining the uniqueness of Christians, in that they alone have attained a true knowledge of God, he wishes to place them in the context of Greek philosophical speculation about the nature of deity, writing in terms that would be familiar to the Stoics and indeed to anyone who had done a little serious reading on the being of God (or god) and the nature of the created order. Biblical references are sparse and the Christological section, of interest as a summary of tradition, makes no attempt at exposition.

All this changes when we pass to Justin. He is the outstanding centre point of the group (as such, he is treated in a separate article). In summary, Justin tries to bring together his philosophical background and his biblical convictions, rooted in Hebrew prophecy, to enunciate distinctively Christian tenets in outline Trinitarian form. The *Logos* communicates God's truth to the world, all humanity sharing in affinity with the *Logos* through rational (*logikos*) creation.

Tatian, a pupil of Justin in Rome, resembles him in some ways. They both came from a pagan background, exploring philosophy on their way to conversion. Yet Tatian can take on an arrogant, dismissive tone, unlike Justin's, in referring to Greek philosophy; nor would he have had Justin's support in his lapses into extreme asceticism, though the question of his link with Gnosticism is best left open. Again, his emphasis on divine transcendence is not balanced by any whole-hearted exposition of the Incarnation and work of the *Logos* (never called "Christ"). On the other hand, he did bring out the *Diatessaron*, a setting out of the four gospels in continuous form that kept before generations of readers the central narratives that must be woven into any future Christology.

In Athenagoras we again meet a man with aspirations to be taken seriously in philosophy. (Indeed, his *Legatio* describes itself as "by Athenagoras the Athenian: Philosopher and Christian".) He shows his claim to the title by a more serious appreciation than Tatian's. His writing has more claim to elegance than anything seen so far and could well have impressed open-minded contemporaries. What Athenagoras conveyed in the *Legatio* or *Supplication* (Greek *Presbeia*) around 177 (the year of the martyrdoms, in the reign of Marcus Aurelius, in Gaul at Lyons and Vienne) was not the expected rebuttal of false reports on Christian behaviour but a balanced account of the nature of the faith. Beginning and remaining a strict monotheist, he goes on to assert the divine unity in the context of a Spirit who speaks through the prophets and is integral to the Godhead, fitting into a form of Trinitarian expression that points forward.

Towards the end of the 2nd century Theophilus exhibits similarities and individual features. Eusebius calls him the sixth bishop of Antioch. He had however grown up a pagan. By the time he came to write *Ad Autolycum*, probably *c.*180, he had taken up a strongly monotheistic position, opposed alike to polytheism and to Marcion with his two gods, the Demiurge and the good God, Father of Christ. Unlike Tatian, Theophilus

came to have some repute as an anti-heretical writer. He maintains a philosophical stance, drawing largely on Middle Platonism for concepts and terminology, and it is through the development of philosophical notions that he reaches a distinctive doctrine of *Logos*. He turns more to Stoicism, contrasting the "innate" (*endiathetos*) with the "external" or "expressed" (*prophorikos*) *Logos*. While looking for philosophical underpinning, Theophilus stays in close sympathy with Hellenistic Jewish monotheism, yet being the first Christian writer to use the term "Trinity" (*Trias*). Again, his Christian position is characterized by the breadth of his New Testament quotations.

A group of "mixed ability", the Greek Apologists have in common an awareness of the world outside the Church, Jewish and pagan, and the pressing need for communication with that world. At the same time, their concentration on undeveloped Christian beliefs begins to point a way forward to later thinkers as diverse in outlook and varying in quality as Irenaeus, Tertullian, Novatian, Methodius, Lactantius, and Eusebius.

D.A. SYKES

See also Justin Martyr

Summary

A group of perhaps 12 writers of the 2nd and 3rd centuries AD who wrote in defence of the Christian faith: Quadratus, Aristides of Athens, Aristo of Pella, St Justin Martyr, Tatian the Syrian, Miltiades, Apollinaris of Hierapolis, Athenagoras of Athens, Theophilus of Antioch, Melito of Sardis, the author of the *Epistle of Diognetus*, and Hermias. Their writings are important for the history of Christian dogma.

Apophthegmata Patrum

Religious compilation of the 5th and 6th centuries

The *Apophthegmata Patrum*, or *Sayings of the Desert Fathers*, represent the single most important source for the history and spiritual teachings of early Egyptian monasticism. The *Sayings* give us an invaluable picture of monastic life in all its complexity and richness from the pioneering days of St Antony the Great to the monastic diaspora of the 5th century. Dealing with every aspect of the ascetic life, from day-to-day concerns to the highest states of prayer, the *Sayings* have had an enormous influence on the Christian tradition, and continue to provide nourishment in our own age.

The *Sayings* are centred on the semi-eremitic form of monasticism that flourished in the descent of Scetis, with many pieces coming also from Nitria and Kellia. References to the fully developed coenobia of the Pachomian type are rare, and often gently critical. Elements deriving from the Palestinian diaspora forced by the barbarian incursions of the early 5th century refer back most especially to the Scetiote tradition.

The *Sayings* as we have them were compiled over the 5th and 6th centuries from the words of instruction spoken by the elders of Egypt, which had initially been preserved by oral transmission. The preface to the Greek alphabetical collection speaks of the redactor's desire to gather together the diffused words of the initiators and masters of the monastic way of life, and to order them alphabetically for the sake of clarity. The fact that the *logoi* of the Desert Fathers were so well known and remembered precluded any significant reworking of the texts. What we have is therefore very much the raw matter of the Desert Fathers' teachings. The main differences in the manuscript traditions are of arrangement, not so much of content. The most familiar arrangement is the alphabetical collection. The anonymous collection, grouped more or less haphazardly, originally, it seems, formed a sequel to the alphabetical collection. Lastly, we have the systematic collection, grouped according to subject matter. The complexities surrounding the genesis of these different arrangements are far from being unravelled.

There is no artificial unity to the *Sayings*. A great many different perspectives are represented. There is, however, a certain unity arising from the common goal and common struggle of the monks whose counsels are preserved. An ideal of monastic perfection is held up, but allowance is made for human frailty. As Amma Syncletica puts it: "lack of proportion always corrupts". We do get occasional glimpses into the highest reaches of mystical experience, as, for example, the vision of Abba Arsenius "entirely like a flame". These glimpses are, precisely, glimpses; the sayings witness to a certain reticence about delving too deeply into such advanced states. Miracles do occur, but are often treated with caution. The ecclesiastical hierarchy is regarded with enormous, but not automatic, respect. Relations within the monastic community form a kind of leitmotif. Laymen are occasionally held up as being of superior virtue to even the greatest of monks: a nice stimulus to monastic modesty. References to the decline in monastic virtue and prowess are frequent. These stem largely from the diaspora element to which we have referred. Most importantly, perhaps, the *Sayings* preserve a record of the living relationships between elder and disciple: they give us an insight into the means by which the wisdom of the desert was passed on from generation to generation.

The attitude of the *Apophthegmata* to outer learning is not unremittingly hostile. While the possession of books is often frowned upon, and philosopher-monks such as Evagrius of Pontus are gently but firmly chastised, the prevailing opinion is that secular learning is not wrong in itself, but rather inadequate for the intensely practical business of the ascetic life. This is wittily illustrated in two of the apophthegms of Abba Arsenius, formerly tutor in the household of the emperor

Theodosius I (379–95). Arsenius is asked by an anonymous interlocutor: "How is it that we get nowhere, while the Egyptian peasants acquire so many virtues?" Arsenius replies: "We indeed get nothing from our secular education, but the Egyptian peasants acquire the virtues by hard work." Again, speaking of an old Egyptian monk he had consulted, Arsenius comments: "I indeed have been taught Latin and Greek, but I do not even know the alphabet of this peasant."

The genre of the *Sayings* has certain precedents in Classical literature. Cato, for example, composed a collection of the apophthegms of Socrates. Peter Brown (1978, p. 82) has characterized the *Sayings* as "the last and one of the greatest products of the Wisdom Literature of the ancient Near East". The *Sayings*, in their various forms, rapidly became the staple diet of the monastic movement wherever it spread. The *Dialogismoi* of Abba Zosimus already quote, in early 6th-century Palestine, from the *Sayings*. They continued to be, and still are, essential reading for monastics of all traditions. They remain an extremely rich source of a form of spirituality that is both profound and intensely practical.

MARCUS PLESTED

Summary

The *Sayings of the Desert Fathers*, compiled in the 5th and 6th centuries from oral tradition passed down by the elders of early Egyptian monasticism. They deal with all aspects of the ascetic life and provide a valuable insight into monastic life from the time of St Antony the Great to the 5th-century monastic diaspora.

Apostasy

Apostasy, the abandonment of Christianity, was an offence under both canon and Byzantine secular law. Whether it is realized by accession to another religion, to atheism, or to non-religiosity is irrelevant. The acceptance of another Christian confession – according to the prevalent opinion – is not considered apostasy, but heresy. In order to commit apostasy, one must already be a regular member of the Church. The offence is committed either voluntarily or involuntarily, and it can be manifested either expressly or tacitly.

The Church had to deal with apostasy relatively early on, because of the persecutions, when a number of Christians grew fearful of remaining in the flock. An immediate consequence of the offence is that the apostate no longer belongs to the Christian community. The sources of canon law of the unified Church of the first centuries very often make special reference to apostasy in relation to the treatment of those who have repented and wish to revert to Christianity. Relevant canons were set forth by the First Ecumenical Council (11 and 12), the Synod in Ankara (1–9), St Basil the Great (73 and 81), St Gregory of Nyssa (2), and St Peter of Alexandria (1–14); there is also canon 62 by the Holy Apostles. Most of these canons are occasional; they dealt with apostates in the time of the persecutions. These canons obviously lack significance today, because they refer to an offence that was committed prior to their enactment. Similarly, there are canons of general validity, such as canon 62 of the Holy Apostles, which determines that any cleric who denies Christ out of fear of non-Christians should be expelled from the Church. But – it continues – if he simply rejects the role of cleric, then he should be unfrocked. If he repents, he may come back to the Church as a layman. In any case, the type of penalty depended on the time at which the offence was committed – that is, on whether it was committed in a time of persecution or in one of peace. Thus, canon 73 of Basil the Great and canon 2 of Gregory of Nyssa, which refer to a time of peace, establish that those who have voluntarily apostatized and have later repented should be subject to a life-long penalty. Only in the last moments of their lives may they be deemed worthy of receiving Holy Communion. By contrast, the treatment of those who committed apostasy during periods of persecution was more lenient. For those who became apostates involuntarily, the prescribed penalty was a nine-year deprivation of Holy Communion. Although clergymen would preserve their priesthood, they remained in suspension for the remainder of their lives: they were not allowed even to preach (canons 1 and 2 of the Synod of Ankara; 10 of Peter of Alexandria).

Byzantine secular law initially punished apostasy with fines (*Codex Theodosianus*, 16. 8. 7). Later the legislation of Justinian prescribed the death penalty (*Codex*, 1. 11. 10pr.). The *Ecloga* (17. 6) enacted particular measures for prisoners of war who were forced to deny their Christian faith. On their return to Byzantium, they were subjected only to ecclesiastical penalties. The same treatment was adopted by the *Zakon Soudnyj Ljudem*, the legal collection that the Thessalonian missionary Methodios drafted and introduced to Great Moravia. Evidently, the reason that the *Ecloga* introduced this lenient measure, was so that prisoners should not be hesitant about repatriating. As for the rest, all the other statutes of Byzantine legislation maintained their validity, as is demonstrated by the Appendix to the *Ecloga* (3. 12. 16–17). The statutes on captives in the *Ecloga* were repeated in the *Ecloga Privata Aucta* (17. 35–36) and in the *Eclogadium* (17. 27). By contrast, the *Procheiros Nomos* (39. 33) and the *Eisagoge* (= *Epanagoga*; 40. 35) do not contain this statute, but only a general one on the elimination of the death penalty, presumably because apostasy under conditions of coercion no longer interested the state, only the Church (according to Troianos, p.

47). The *Basilica* repeated the statutes of Justinian. By way of the *Basilica*, these were incorporated in the *Syntagma* of Matthaios Vlastaris, in the *Hexabiblos* of Constantinos Harmenopoulos, and in the *Nomokanon* of Manouil Malaxos. Furthermore, the secular law provided for concurrent penalties. The apostate was unable to bear witness, to make a will, or to inherit. Other penalties included confiscation of his property and exclusion from civil and military offices.

During the period of Ottoman rule, large numbers of Christians (and Jews) converted to Islam, voluntarily or involuntarily. Because of the restrictions imposed by the Ottomans, the Church was unable to take any of these measures against them. However, Islamic converts who reverted to Christianity received the death penalty from the Turkish authorities; this was the penalty prescribed by Muslim religious law (the *Sharia*) for apostates from Islam. The latter constituted the body of "neomartyrs" in the Orthodox Church.

In more recent and contemporary Greek secular law, apostasy no longer constitutes a criminal offence. On the basis of the principles and the constitutional statutes on religious freedom, accession to another religion is a matter of personal freedom. Its penal treatment is confined to canon law only: laymen may be excommunicated and clergymen unfrocked (and subsequently excommunicated). The excommunication is imposed under the Synod of the Hierarchy (article 4, §9 of Law 590/1977 = Charter of the Church of Greece). Although the consequences of excommunication are ecclesiastical in nature, excommunication undoubtedly also affects the social status of the person subjected to it.

Appian *c.*AD 95–160s

Historian

Appian was a Romanized Greek, who was born in the dynamic but turbulent city of Alexandria in Egypt. Josephus refers to the "constant strife between the natives and the Jewish colony" (*Jewish War*, 2. 487) that had existed ever since Alexander the Great had given the Jews permission to reside in the city with the same rights as the Greeks. One dramatic fragment of Appian's lost autobiography relates his narrow escape from an angry group of Jews during the Jewish revolt (AD 115–17). This personal experience of civil unrest may help to explain why Appian devotes such a large proportion of his historical narrative to the Roman civil wars of the 1st century BC. Subsequently, he left Alexandria and moved to the more secure environment of Rome, where he became an advocate and was eventually awarded a procuratorship. We have a letter from Fronto to Antoninus Pius (emperor AD 138–61) requesting this position for his friend.

Appian's most important achievement is his historical work, the *Romaica* (written between *c.*AD 148 and 161), which narrates the rise of Rome and its progressive conquests of different nations "in order to understand the weaknesses or endurance of peoples, as well as the virtues or good fortune of their conquerors, or any other factor which contributed to the result" (preface, 12). This focus recalls the pragmatic historiography of Polybius (*c.*200–*c.*118 BC), who in the *Histories* likewise seeks to explain the growth of Roman power. Yet where Polybius analyses a 53-year period in 40 books, Appian's chronological scope is broader, moving from the kings of Rome to Trajan's war in Arabia in 24 books. The *Romaica* are structured along geographical and ethnic lines, with each book usually devoted to a particular people, although book 8 (Hannibal) and book 12 (Mithridates VI) break the pattern by focusing on individual enemies of Rome.

We do not have Appian's whole work, but what survives is impressive and revealing. Appian was writing for a cultured Greek-speaking readership, who wanted to understand more about Roman history and institutions. Consequently, the narrative is punctuated with practical explanations, which frequently remind us that Appian is looking at Rome from the viewpoint of the provincial outsider. So, the military eagle is described as "the symbol held in the highest regard by the Romans" (*Civil War*, 2. 61. 256). Not only does Appian offer explanations of potentially unfamiliar terms, but his Greek prose is accessible and sometimes even includes transliterated Latin words. The 9th-century Byzantine scholar Photios approvingly characterized Appian's Greek as "plain and unadorned". The discovery of a papyrus at Dura Europos containing fragments from Appian and Herodotus suggests that the Alexandrian historian was indeed popular. Some modern critics suggest that Appian's main significance lies in his preservation of crucial material from lost historians such as Asinius Pollio, but this is to undervalue the *Romaica*. Appian in his own right made Roman history accessible to an inquisitive Greek-speaking audience, who were themselves increasingly involved in government and administration within the empire. That there was an appetite for historical texts about Rome among this mobile, Greek-speaking elite is suggested by Zenobius' translation of Sallust's works into Greek under Hadrian. Of course, Greek speakers could always turn to the universal histories of Nicolaus of Damascus or Diodorus Siculus, but these were almost too comprehensive (144 and 40 books respectively), and both narratives stopped in the 1st century BC. The expansion of the Roman empire between the reigns of Augustus and Trajan called for an updated history, which Appian provided.

Although the *Romaica* helped to orientate Greek-speaking readers in the Roman world, Appian could still criticize

Roman methods and shortcomings. So Appian narrates the proscriptions with particular disgust (*Civil War*, 4. 16), and outlines the sufferings of the people of Gomphi, including one incident where 20 distinguished elders, who had poisoned themselves, were discovered lying on the floor "as if they had succumbed to drunkenness" (*Civil War*, 2. 64. 268). Poignantly, Appian juxtaposes the genuine inebriation of Caesar's callous soldiers with the apparent drunkenness of these desperate citizens. It is at such moments that Appian's background as a provincial offers us some uncompromising perspectives of Rome.

Appian's *Romaica* survived, albeit in a fragmented state, largely thanks to the efforts of the excerptors who worked for the emperor Constantine VII Porphyrogennetos (913–59). The first printed edition (Venice, 1477) was a Latin translation by Pier Candido which had been commissioned by Pope Nicholas V. The popularity of this edition prompted first an Italian translation (Rome, 1502) by Alessandro Braccio on the foreign wars, and a French translation (Lyons, 1544) by Claude de Seysell dedicated to King Louis XII of France. Seysell's translation inspired several baroque dramatists, including Pierre Corneille, who took material from Appian for his tragedy *Rodogune* (Paris, 1647). Yet no printed text of Appian in Greek appeared until Carolus Stephanus' edition (Paris, 1551). The first English translation (London, 1578), by William Barker, was grandly entitled *An Auncient Historie and Exquisite Chronicle of the Roman Warres, with a Continuation from the Death of Sextus Pompeius till the Overthrow of Antonie and Cleopatra* and praised Appian as a "noble orator and historiographer". Since Appian's narrative of the civil wars ends with the death of Sextus Pompey, Barker decided to supplement the account with material from Plutarch. Subsequently, William Shakespeare used Barker's Appian when writing *Antony and Cleopatra* and especially *Julius Caesar*. Appian's work remained popular, although not everybody had to rely on translations. In a letter to Engels, Karl Marx wrote: "As a relaxation in the evenings I have been reading Appian on the Roman civil wars in the original Greek. A very valuable book. The chap is an Egyptian by birth. Schlosser says that he has 'no soul', probably because he goes to the roots of the material basis for these civil wars." So, from the late 15th century onwards, Appian has continued to appeal to notable dramatists and intellectuals seeking to gain access to the Roman world through a lucid and accessible historian, who originally wrote to inform a predominantly non-Roman audience.

RHIANNON ASH

Biography

Born in Alexandria *c.*AD 95, Appian experienced the Jewish revolt of 115–17 before moving to Rome where he became an advocate and later a procurator. He died in the 160s. He wrote a history of Rome in 24 books for a Greek-speaking readership. Beginning with the kings of Rome, it is organized on geographical and ethnic principles, and ends with Trajan's war in Arabia. Not all of it survives.

Apseudes, Theodore

Painter of the late 12th century

The signature of this master painter is to be found at the Enkleistra of St Neophytos near Paphos in Cyprus. The inscription, which is in a shallow cavity below the *Deesis* (Supplication) panel on the north wall, and below the prostrated figure of the donor, St Neophytos, reads: "The Enkleistra was painted by the hand of me, Theodore Apseudes, in the year 6691 [1183]". Another inscription in the adjoining church tells us that "The most venerable church of the life-giving Cross was hewn out, built and painted by the contribution and great toil of our holy and divinely inspired father, Neophytos, in the year 6704 [1196]". The problem is that between the two dates there are perhaps five periods of painting, most of which are very close in style, and it is not clear to which (if not to all) of the paintings Apseudes is referring. For the moment, therefore, it is best to regard Apseudes as an important master in a school of painting. The style of most of the work in the Enkleistra relates to the well-known late 12th-century development of elaborate linear patterning in Byzantine painting.

St Neophytos carved his tomb in the cell where he first lived, and on the ceiling of it are small paintings of the *Crucifixion* and the *Anastasis* (Resurrection). The Byzantine Anastasis combines the two scenes of the Descent into Hell and the Resurrection, and Apseudes' version is full of movement and powerful emotion, which are intensified by the linear patterns of the clothing. The *Crucifixion* depicts the relatively new type of Christ wearing only a loincloth, with his body hanging in a curving shape indicative of resignation and suffering. The figure of St John is in a style similar to the St John of a second *Crucifixion* scene painted on the partition between the cell and the bema. The linear elaboration of St John's garments is less marked than elsewhere in the Enkleistra. The most striking feature is the head, which is bowed in grief and

supported by the right arm and hand. The face is realistically cupped in the hand with the little finger just below the eye socket, as if wiping away a tear. The eyebrows and the lines below the eye are contorted as if in sorrow. The overwhelming effect of grief constitutes a new achievement in medieval painting. The depiction of a recognizable human emotion was to become a standard feature in Byzantine painting and it was later adopted by 13th-century Italian painters under Franciscan patronage. The other feature that these small paintings have in common is the sense of monumentality. Their size, as with any great work of art, is irrelevant and they are as effective if projected on to a large screen as they are in the original small scale of the Enkleistra. Among the larger paintings in the cell, the *Deesis* is notable for a technical innovation in the use of fresh plaster patches for the heads of the figures. In some of the cell and bema paintings this is combined with the practice of reworking the plaster to bring moisture to the surface before completing heads and hands at the finishing stages of a painting.

These technical innovations, together with the stylistic feature of wind-blown draperies, link the school of Apseudes with the important paintings at Lagoudera in Cyprus, dated to 1192. The church at Lagoudera is high in the Pitsillian region of the Troodos mountains and its remoteness has no doubt contributed to the fine state of preservation of its paintings. The church is small and the painter chose to depict only a few scenes from the life of Christ, and two from the life of the Mother of God, all on a grand, monumental scale. Similarities in small painterly details such as highlights and linear patterns between the two churches make it quite clear that the paintings come from the Apseudes school. They also share the rarely observed technical similarity of fresh plaster patching a century before this practice appears in Italy. Similar stylistic links appear in a single grand painting of *St George* in the south bay of the narthex of the church at Asinou, and in some of the paintings at the church of the Archangel at Kato Levkara. There are therefore enough stylistic and technical affinities between these paintings to link these four churches to the Apseudes school. There are also icons that can be linked to the same school.

The salient characteristic of the school is the windblown draperies which can be found in an icon of the Annunciation at the monastery of St Catherine on Mount Sinai and in churches at Nerezi and at Kurbinova in Macedonia. The influence of this style can be detected further afield in some of the mosaics of the Sicilian churches, and in St Mark's, Venice. The wider influence of the Hellenic tradition can be detected in the undoubted affinities of these windblown draperies to the Classical sculptures of ancient Greece. It is not necessary to suppose any direct observation of ancient sculpture on the part of painters, so much as to suggest that a long-standing cultural influence was at work here.

DAVID WINFIELD

See also Painting

Biography

Master painter active in Cyprus in the late 12th century. Nothing is known of his life. His paintings are notable for the introduction of human emotion and a sense of monumentality to Byzantine painting. The use of wind-blown draperies links his work with earlier examples in Sinai and Macedonia and with the Classical sculpture of ancient Greece.

Apulia

Region of southeast Italy

Apulia (modern Puglia) has been associated with Greek culture since antiquity. The region has Messapian or Greek foundation legends, mentioned already in the writings of Herodotus (7. 170). The name Iapygia is used by Greek writers to denote the same region, although it also refers to the region of Calabria. Many places in Apulia were colonized by Greek cities by the end of the 8th century BC, but that was just the climax of a long history of contacts between the Greeks and the autochthonous population of Italy. One of the most important cities of the area, Tarentum (ancient Greek Taras, modern Taranto), was supposed to have been founded around 706 BC by Spartans as their only colony. The gulf of Taranto had already been colonized by Achaeans from the Peloponnese, who first established Sybaris in 721 BC and then Croton and Metapontium. Taras, the only Dorian colony, was founded after the First Messenian War (traditionally in 706 BC), an example of the tensions in Greece that led to colonization. The founders came from Amyclae, an ancient sacred town of the Spartan state, and according to Strabo (6. 3. 2f.) were linked to Spartans by the maternal side only; they were thought to be illegitimate children of unmarried women, thus they had the name *partheniai* ("sons of concubines"). It is possible that they were of pre-Dorian origin. They were guided by an oracle to establish a colony in the west, and this is typical of the role of religion, and oracles in particular, in sanctioning new settlements. One of the first things that the colonists would do was to establish their religion.

The Greek colonies in Apulia flourished thanks to the craftsmanship and trade that soon developed. Taras, in particular, owed its prosperity to the textile and pottery industries that were soon supplying the rest of Italy. Taras was also famous for its jewellery, as the exquisite collection of the

modern archaeological museum bears witness today. Many of the most important archaeological finds were made only as a result of bombings in World War II. Sybaris was proverbial for its wealth and luxury (Herodotus, 6. 126) and had developed commercial relations with Miletus in Asia Minor. After the initial colonization, many of the cities were able to found further colonies; thus Sybaris founded Poseidonia (the Latin Paestum) on the west coast of Italy. Metapontium, Sybaris, Croton, Siris, and Paestum are known as the "Achaean" area, a term that refers not only to the origin of many of the colonists but also to the artistic styles that were developed there. The artistic currents of Magna Graecia combine many elements.

Sybaris was destroyed by Croton in 510 BC, and the city of Thurii was founded on its site, at the initiative of Pericles, in 444 BC. The famous city planner Hippodamus of Miletus designed the city and was himself one of the leading colonists. This was a part of the ambitious strategy of Pericles to make Athens the centre of a greater Greece. The geographical situation that gave all these cities immediate access to the sea and a fertile hinterland was a significant factor for their later development. This economic growth was soon to be followed by cultural development. Apulia, together with Calabria and Sicily, constituted the region of Magna Graecia. The region of Apulia drew the attention of Rome at the end of the 4th century BC and the Tarentines invited king Pyrrhus of Epirus to assist them in 280 BC. During the Hannibalic and Social Wars there were serious revolts against Rome, which were followed by the destruction of many Apulian cities. After it was annexed to the Roman empire, the region experienced troubled times. Under Diocletian Apulia and Calabria formed a single province. Christianity reshaped the cultural history of the region.

In Byzantine times Apulia suffered material damage in the wars of Justinian I against the Goths, and was later conquered by the Lombards. In the 8th century the Arabs, the Byzantines, and the Lombards laid claims to the area. Apulia was reconquered by the emperor Basil I (876–86) and it stayed under Byzantine rule until the 11th century when the Normans captured it. In 1480, having completed the conquest of continental Greece, Mehmet II managed to occupy the harbour city of Otranto, then considered the most important centre of Greek culture. Several Byzantine churches still survive in Apulia, one of the most famous being the 11th-century church of San Pietro at Otranto, which has several layers of painting. In the southern part of the peninsula the city of Callipoli was founded as a colony of Taras. The Spartan Leucippus soon made it a free city; it was an important commercial settlement in Byzantine times, and there were many monasteries in the area. It was occupied by the Normans in 1071 and later by the Turks in 1481. A minority Greek population survived until the 20th century, consisting mainly of merchants and sailors.

A Greek dialect is still spoken today in the area of Salento, and particularly in the area of Lecce. The villages or towns that preserve some form of that dialect, referred to by the locals as *griko* or *grigo*, are Calimera, Sternatia, Soleto, Martignano, Castrignano, Melpignano, Galatina, and Zollino. There is debate among scholars as to the origin of the dialect, whether it originates from the ancient Greek of Magna Graecia, or is derived from later Byzantine dialects. There is a rich Hellenic tradition that has shrunk significantly in modern times. In some places, such as Calimera and Sternatia, an attempt has been made to preserve an otherwise dying culture and language.

Summary

The heel of Italy, Apulia has had Greek connections since antiquity. There were many Greek colonies by the end of the 8th century BC. Taras (modern Taranto) was founded by Sparta *c.*706 BC. Apulia prospered by trade and by developing textile and pottery industries. It formed a single province with Calabria under Diocletian. It was disputed between Arabs, Lombards, and Byzantines until the 11th century when it was taken by the Normans. A Greek dialect is still spoken in some villages.

Arabia

The geographic term "Arabia" is applied to the Arabian peninsula (*Shibh al-Jazirah al-'Arabiyah* in Arabic), which is located in the extreme southwestern corner of Asia and encompasses the modernday countries of Kuwait, Qatar, the United Arab Emirates, the Sultanate of Oman, Yemen, and the Kingdom of Saudi Arabia. The Arabian peninsula is bordered by the Red Sea on the west and the southwest, and the Gulf of Aden on the south, the Arabian Sea on the south and southeast, and the Gulf of Oman and the Persian Gulf (also called the Arabian Gulf) on the northeast. Geographically, the peninsula and the Syrian desert merge in the north. The peninsula's total area is about 2,590,000 sq km. The length bordering the Red Sea is approximately 1900 km and the maximum breadth is approximately 2000 km.

The ancient Greeks, who coined the term "Arabia", derived it from the name of a pastoral people, the Arabs, whose presence in the northern Arabian and Syrian desert is well attested to by Assyrian records dating from the 7th century BC which refer to them as *Aribu* or *Aribi*. When the Greeks first reached the shores of the Arabian peninsula, sometime between the 6th and 5th centuries BC, they gave the name Arabia first to the

northern desert area, and then by extension to the whole peninsula to the south. In time there developed a distinction between a Desert Arabia (*Arabia Deserta* in Latin) in the northern part of the peninsula; a Rocky Arabia (*Arabia Petraea* in Latin) on the western fringes of the desert; and a Fertile Arabia (*Arabia Eudaimon* in Greek; *Arabia Felix* in Latin) in the south. None of these three regions was strictly defined, and they were for the most part unexplored.

In antiquity, and until the 7th century AD, trade was the main link between Arabia and the Greek-speaking world. Trade through Arabia also involved items from Ethiopia (Axum), India, and China. The importance of this region to the Byzantine world lay in its strategic proximity to Iran (Byzantium's imperial rival) and its control of the route to India. Most Arabian cities were founded along the caravan trade route that ran along the western edge of the desert, and it was in these cities that interactions between Arabs and Greeks took place.

Knowledge of the history of Arabia comes from records of early travellers and historians, such as Herodotus (*c.*430 BC), Strabo (*c.*AD 22), and Pliny (*c.*AD 23). Most of these accounts concentrate on south Arabia, whence the trade goods originated. In marked contrast with the arid wastes of northern and central Arabia, southern Arabia was a fertile, sedentary, and civilized region. South Arabia was famous for its wealth in spices, minerals, and fruits, as well as for its various kingdoms. In fact, the Greek writer Eratosthenes (writing in the 3rd century BC) described southern Arabia as inhabited by four major peoples, and it is on the basis of his nomenclature that scholars today speak of the south Arabian kingdoms of the Minaeans, the Sabaeans, the Qatabanians, and the Hadramites.

Between the 3rd and 6th centuries AD several Byzantine imperial and ecclesiastical missions were sent to the western and southern parts of the peninsula, and a few cities were converted to Christianity. However, Mecca, the pilgrimage centre of Arabia and the city where Muhammad (the Prophet of Islam) appeared in the first decade of the 7th century, was not converted. Muhammad's mission quickly and fundamentally altered the face of Arabia and its relationship to its Greek-speaking neighbour, the Byzantine world. Arabia became the base of operations against Byzantium. After the Prophet's death in 632, the Arabs wrested the Levant, Egypt, and the rest of North Africa from the Byzantines. By the advent of the Umayyad dynasty in 660, attacks against the Byzantines were conducted from the Umayyad capital, Damascus in Syria, and thus Arabia virtually lost its relevance to the Greek world.

LARA G. TOHME

Summary

Arabia was the Greek name for the peninsula between the Red Sea and the Persian Gulf. Greeks first visited Arabia in the 6th century BC and traded with it until the 7th century AD. Southern Arabia in particular was famous for its spices, minerals, and fruits. The rise of Islam put an end to relations between Arabia and the Greek world.

Arabs

According to modern usage, Arabs are any of the Arabic-speaking peoples living in the vast region extending from Mauritania on the Atlantic coast of Africa, to southwestern Iran, including the entire Maghrib of North Africa, Egypt and the Sudan, the Arabian peninsula, Syria, and Iraq. In antiquity this term usually referred to the largely nomadic and pastoral Semitic tribes and peoples who lived in and around the modern Arabian peninsula. However, Neo-Assyrian and biblical references dating back to the 9th–7th centuries BC do not relate Arabs particularly with the country of Arabia, but refer to tribes in the Sinai, in Jordan and Syria, and even along the banks of the Euphrates. The term is believed to be absent from inscriptions of Yemen prior to the 2nd century BC. In this article the term is used in a somewhat broad sense, denoting not solely people of Arab blood but including all those who were politically under Arab rule, who spoke the Arab language, and who, since the birth of Islam, have followed that religion. More important than political, racial, or religious unity is the Arabs' common cultural history and their participation in the scientific heritage derived from the Hellenistic world.

Arabic-speaking peoples are mostly Caucasoids of the Mediterranean physical type, although considerable regional variations exist, with admixtures of Negroids of Africa and Mongoloids of Asia. The early inhabitants of the Arabian peninsula reared sheep, goats, and camels in their harsh desert environment, while those settled in the oases cultivated dates and cereals. These oases also served as centres of the caravan trade. From around the 5th century BC Arab families or tribes began to found small states, often at centres of the overland caravan trade. Of these, Petra in present-day Jordan became the capital of the Nabataeans; in AD 106 it was conquered by the Romans, who allowed it to flourish well into the 3rd century. The Syrian desert town of Palmyra came under Roman domination around AD 160 and reached its height in the mid-3rd century.

Herodotus was familiar with the Arabs of southern Palestine and the Sinai as well as those of the frankincense-producing region. According to him the Arabs were among the nations that paid tribute to Darius I of Persia (Hderodotus, 7. 69, 3. 97). But it was the expeditions of Alexander the Great in the region of the Red Sea that brought greater knowledge of the Arabs to the Greeks, as reflected, for example, in the partially preserved work of Agatharchides, the source of Diodorus Siculus' description. According to Arrian (*Anabasis*, 7. 19. 5), Alexander's last plans included the conquest of the eastern Arabian coast, and in preparation for this he dispatched naval expeditions to both the Persian Gulf and the

Red Sea. The presence of Hellenistic Greeks in Bahrain and especially in Failaka, and Antiochus III's expedition to Gerrha in the Saudi interior, reflect early interest in Arabian and Indian trade on the part of the Seleucids. Ariston explored southwards as far as Babel-Mandeb for Ptolemy, who punished the hostile Nabataeans of Petra by tapping the incense route to the south of the city through a trade arrangement with the Lihyanites of Dedan. During Hellenistic times the northern territories as far as the Negev and Transjordan were inhabited by the Nabataean Arabs, who developed their land through skilful water conservation. The southern kingdoms were Minaea on the Red Sea, Katabania at the straits of Hormuz, and Sabaea, the Hadramaut, and Mhra along the south coast. Minaea had ceased to exist by the 2nd century BC and Yemen was dominated by a confederacy of Sabaeans and Homerites. Apart from these petty kingdoms of the south and the north, and to a large extent within them, the political organization of pre-Islamic Arabia was a primitive kinship structure united in clans and tribes which were named after a supposed common ancestor. As a political unit, pre-Islamic Arabia existed only in the careless nomenclature of the Greeks, who used the name Sarakenoi (apparently from the Arabic *Sharqinun*, "easterners") to denote all the population of the peninsula.

For his accounts of the Arabs of Mesopotamia (along the Euphrates), Egypt (Sinai and the Red Sea), southern Jordan (the Nabataeans), the steppe, and eastern Arabia (Gerrha), Strabo depended on Hellenistic sources as well as the Arabian campaign of Aelius Gallus under Augustus. Although this expedition ended in failure, Roman naval predominance in the Red Sea was secured, and the movement of Roman merchantmen between Egypt and India was facilitated by the reduction of Aden, whoever may have been responsible for it (*Peripl. M.E.* 26).

For the Greeks and the Macedonians, Arabia was important chiefly for its incense and spices as well as for gold and gems. They also depended on the Arabs as middlemen for their Indian trade. However, the importance of this role diminished after Hippalus discovered the use of the monsoons for annual direct voyages to India. It is sometimes claimed that this practice was already known to the Arabs for centuries and that the Greeks merely learned from them; but one has to question whether Arab ships of the time were capable of such voyages even if the Arabs knew the "secret" of the monsoons. For both Classical and biblical authors, the defining characteristics of the Arabs were nomadism, pastoralism, and the camel-based caravan trade. However, their military strength is already mentioned in early (Assyrian) sources, and becomes prominent in Roman times. The organization of the southern sector of the *limes* shows that the Romans of the empire took account of their historical role, their steady pressure on the settled lands of the north, and their infiltration into the Syrian end of the Arabian peninsula. The evolution of this military frontier-in-depth from the Euphrates to the Red Sea involved absorption of the client Nabataeans into the Roman provincial system. This was achieved by Trajan in AD 106 through the expedition of Cornelius Palma. The resulting province of Arabia expanded slightly to the north under Septimius, and was divided by Diocletian into Arabia and Palaestina Salutaris, the latter subsequently incorporated into Palestine around AD 358. During the 4th and 5th centuries the *limes* was strengthened in response to the Saracen threat; but by the 6th century it had fallen into decay, so that the Muslim Arab invasions of the early 7th century found it no obstacle. The Arab *foederati* who (with the Phylarch as their chief) shared with the *limes* the defence of the Roman east, included the Tanukhids of the 4th century, the Salihids of the 5th, and the Ghassanids of the 6th.

The birth and spread of Islam in the 7th century led to the unification of the Arab tribes, and during the centuries following the death of the prophet Muhammad in AD 632, the new religion spread throughout most of the present-day Arabic-speaking world and beyond into Central Asia, the Iberian peninsula, Sicily, sub-Saharan Africa, Madagascar, the Indian subcontinent, and the Malay peninsula. Consequent upon the rapid establishment of Islamic supremacy Arabic, the language of the Holy Qu'ran, was adopted throughout much of the Middle East and North Africa.

Although Arab relations with the Byzantine empire consisted largely of invasions and conquests, there were also significant economic and cultural exchanges. Arabs (and Syrians) came as merchants not only to Constantinople, but even as far as Athens, where an Arab colony appears to have existed during the 10th and 11th centuries according to archaeological evidence. Close contact with certain Byzantine circles is suggested by Abbasid attempts to support insurgents from Thomas the Slav to Andronikos Doukas. People of mixed Arab and Greek parentage were so common in the eastern provinces that one of them became the hero of the epic *Digenis Akritas*. There were Christian communities and monasteries within the Abbasid caliphate in which Greek literature flourished during the 8th century and probably later. The caliphs encouraged scholarly contact and tried to invite to Baghdad Byzantine scholars, such as Leo the Mathematician, while Photios went there on an embassy.

Byzantine art and architecture imbibed a considerable amount of Islamic influence. Emperor Theophilos's palace in Constantinople, with its wild animals, automata in the shape of birds or lions, and garden of artificial trees made of precious metals, is said to have been built on Arab models, being similar to Abbasid palaces in Baghdad. Ruins of a palace on the Asian side of the Bosporos with a domed audience hall are thought to relate to a series of earlier Islamic palaces. Early Islam may also have had some impact on the changes in coinage introduced by Justinian II and on iconoclasm. Objects with Islamic motifs appear more abundantly during the Macedonian and Komnenian periods, and in fact down to the Latin conquest of 1204. Roundels with animals or hunting scenes typical of Islamic and early Iranian designs appear on textiles, and silks in particular, while official or expensive costumes tend to adopt eastern cuts and motifs. Ceramic vessels and decorative tiles adopt several motifs and techniques developed in the Muslim world. The crown of Constantine IX and the Pala d'Oro in Venice incorporate enamels with dancers and hunters typical of Islamic art. Islamic features are also evident in what have been interpreted as Byzantine silver objects from central Russia. Imitation of the angular Kufic style of Arabic writing produced the "pseudo-Kufic" motifs which decorated Greek churches. The treasury of St Mark's church in Venice contains a glass cup with an imitation of an Arabic inscription so well executed as to seem legible, placed next to beautifully copied antique motifs. Traces of Islamic influence are evident in

Byzantium from the 9th century, yet Byzantine art was less consistently affected by Islam than the art of other Christian groups in western Asia who came under Islamic political domination, such as Armenians, Georgians, Syrians, and Copts. Religious art rarely reflects Islamic influences, and never in style and expression, the formal means by which Byzantine art differentiates itself from other medieval traditions. On the other hand, it is in the secular art of emperors and in many aspects of material culture that Islamic themes are most evident. This is not surprising since it was an emphasis on representations of pleasure (dancing, singing, music, and hunting) as an expression of power and wealth that Muslim princes introduced into the language of imperial art.

In science the Arabs preserved and developed Greek mathematics, physics, chemistry, astronomy, and medicine, and transmitted to Europe this Greek heritage, after enriching it considerably. Arabic scientific terms still lie embedded in European speech. Islam appeared at a time when the Greek mind, which had earlier attained such heights of learning and wisdom, had come to a point of virtual stagnation. Muslim scholars lost no time in picking up the threads of Greek science. They not only procured and translated Greek texts, but they critically analysed them, collating, correcting, and even substantially supplementing the Greek contributions to science and philosophy. In the field of science the Arabs did not merely transmit to posterity what they received from the Greeks, but gave it a new lease of life and a fresh development in the Arab environment. In mathematics and astronomy they coordinated the work of Greek and Indian scientists and thence made a very real advance. They developed both algebra and plane and spherical trigonometry. They diligently made and recorded astronomical observations which not only extended their Hellenistic inheritance, but also checked and corrected older records. The new astronomy of the 13th century was in a way a futile attempt to correct what the Arabs had perceived as defects in the Ptolemaic cosmology, something that was not achieved until Copernicus. Al-Khwarizmi (780–850) improved on Ptolemy's latitudes and longitudes and reduced his overstatements of size, e.g. of the Mediterranean. He also added many place names which had originated after the Islamic conquests, and were therefore unknown to Ptolemy. By the mid-9th century Arab scientists were able to consolidate what knowledge they had inherited from the Persians and Greeks, and to assimilate it to their own scientific knowledge. Through the Nestorians most of the Greek scientific and philosophical classics had been translated into Syriac and, through Syriac as well as independently, into Arabic. Most significant in this respect was the knowledge which they obtained concerning Hippocrates, Plato, and Galen. This last writer, in particular, came to be criticized by Arab anatomists: e.g. by Abd al-Latif al-Baghdadi (11th century) for asserting that the lower jaw is composed of one bone only; and by Ali Ibn Abbas for suggesting that there were three layers in the walls of blood vessels. Moreover, whereas Galen held that there were only seven bones in the human skull, Muslim anatomists believed that there were eight.

The survival of scientific medicine in the west during the dark ages was due chiefly to three factors: the activities of Jewish physicians who circulated Graeco-Arabic medical knowledge in Christendom; the Byzantine culture of southern Italy; the rendering into Latin of Greek and Arabic medical treatises. The school of Salerno was probably best situated and best prepared to take advantage of these influences. Those who taught and studied there included Greek, Latin, Muslim, and Jewish physicians, and until the 12th century Salerno remained the leading medical institution in Latin Europe.

It is interesting to note that although many Greek texts were translated into Arabic and thence into Latin, few Arabic texts are known to have been translated into Greek. These few are primarily scientific texts, especially on astronomy and, to a lesser extent, on medicine and pharmacology. Among the eastern texts that penetrated Greek literature in the 11th century were the *Stephanites* and *Ichnelates*, translated from Arabic by Symeon Seth. In other fields such as fables, stories, games, numbering system, and music, the Arab contribution is widely accepted as one of transmission from lands further east than one of origination.

D.P.M. WEERAKKODY

Summary

"Arabs" here includes all those of Arab blood and politically under Arab rule. The Arab world was first made manifest to the Greeks by Alexander the Great. Arabia was important as a source of incense and spices, gold and gems. Relations between Arabs and Byzantines were characterized not only by invasions and conquests but also by economic and cultural exchanges.

Aratus

Author of astronomical poetry of the 3rd century BC

Aratus, the author of *Phaenomena*, the most influential poem in ancient Greek after the Homeric epics, flourished in the first half of the 3rd century BC. Four ancient *Lives* and the entry in the *Suda* combined show that he was born in Soli in Cilicia, that he studied in Athens, where he associated with Callimachus and the philosophers Timon of Phlius and Menedemus of Eretria, and that he was taught Stoicism by Zeno. The only sure date in his biography is 277/76 BC, when king Antigonus Gonatas brought him into the royal Macedonian court at Pella. After a time in residence at the

court of the Syrian king Antiochus, Aratus returned to Pella, where he predeceased Antigonus (d. 240 BC).

Aratus composed many works, including a scholarly commentary on Homer's *Odyssey*, a hymn to Pan that celebrated Antigonus' defeat of the Celts in 277 BC, epigrams (two survive), other elegiac poems, funeral dirges, a hexameter poem called *Iatrica* ("Medical Healing"), a poem about the harmony of the spheres called the *Canon* ("Table"), and *Astrica* ("On Stars") in at least five books. This list may include a collection called *To Kata Lepton* ("Works Slenderly Composed", from which the collection in the *Appendix Vergiliana* derived its title), or that descriptive may apply to Aratus' poetic style generally. His only surviving work is the *Phaenomena*, a didactic epic poem in the style of Hesiod that deals with the astronomical constellations and with weather prognostication. The poem consists of 1154 hexameters: a Stoic proem to Zeus, whose influence pervades the poem (1–18); the constitution of individual constellations in the northern and southern skies (19–453); the planets (454–61); the measurement of time and how to mark nocturnal time by simultaneous risings and settings (462–757); weather signs (758–1141); and a conclusion (1142–54).

The first *Life* explains that Antigonus commissioned the *Phaenomena* by asking Aratus to versify the prose treatise on astronomy by Eudoxus of Cnidus (*fl.*340 BC). The extant commentary by Hipparchus details the relationship between Aratus' poem and Eudoxus' source material. Although Aratus' astronomical inaccuracies disturbed Hipparchus, the poem enjoyed immediate recognition and lasting success among readers who were taken by its poetic achievement. The *Phaenomena* masterfully proceeds in an epic style calculated to emulate Hesiod, whose reputation flourished in the early 3rd century BC, the golden age of Hellenistic poetry. Aratus' literary accomplishment was not lost on contemporaries. The great Hellenistic poets Callimachus (*Epigrammata*, 27) and Leonidas of Tarentum (*Anthologia Palatina*, 9. 25) praised Aratus' refinement – each using the adjective *leptos* (subtle) particularly – and Ptolemy Philadelphus stated in an epigram (*Supplementum Hellenisticum*, 712) that the *leptologos* (subtle-tongued) Aratus deserved to wield the sceptre among poets on astronomical topics. This terminology suggests that the poet's intended audience was an elite readership with interests in literary esoterica.

That some 20 subsequent authors wrote commentaries on Aratus or composed *Aratea* demonstrates the breadth of the poem's influence. It is among a handful of Greek poems to have been translated anciently into Arabic. And its influence on Roman poetry is of tremendous importance. The influence is manifest in the great didactic hexameter poems written by Lucretius and Virgil (*Georgics*) in the 1st century BC, both clearly having been influenced by Aratus' style. Latin poets exhibited a "strong urge to win Aratus for Latin" as part of a patriotic move to "absorb the three great poets [i.e. Callimachus, Theocritus, and Aratus] of the classic Hellenistic generation" (Courtney, 1993). This urge was made manifest among the new poets by Cinna, who brought a copy of Aratus back from Bithynia; by Varro of Atax, whose *Ephemeris* closely recalls Aratus in its extant fragments; and by a youthful Cicero himself, whose *Aratea* consists of 480 continuous lines and some 70 additional lines called the *Prognostica*. Virgil mines Aratus for material in a remarkable passage of the *Georgics* (1. 351–460). Although Ovid's *Phaenomena* survives in only two fragments, both bear strong resemblance to Aratus. Germanicus modernized Aratus, fitting the whole into 725 lines, of which 200 are not based on Aratus, and correcting some errors. Avienus (*fl.* mid-4th century AD) composed a version expanded by more than 700 lines over what Aratus himself had written: *Aratea Phaenomena* (1325 hexameters) and *Aratea Prognostica* (552 hexameters). This interest propelled Aratus into western literature with immense influence (Böker), which is still working today.

ROGER T. MACFARLANE

Biography

Born in the late 4th century BC in Soli in Cilicia, Aratus studied in Athens where he was taught Stoicism by Zeno and associated with Callimachus, Timon of Phlius, and Menedemus of Eretria. In 277/76 BC he was introduced to the Macedonian royal court at Pella by Antigonus Gonatas. He composed much poetry but only the *Phaenomena* survives, a didactic poem on astronomy. He died before 240 BC.

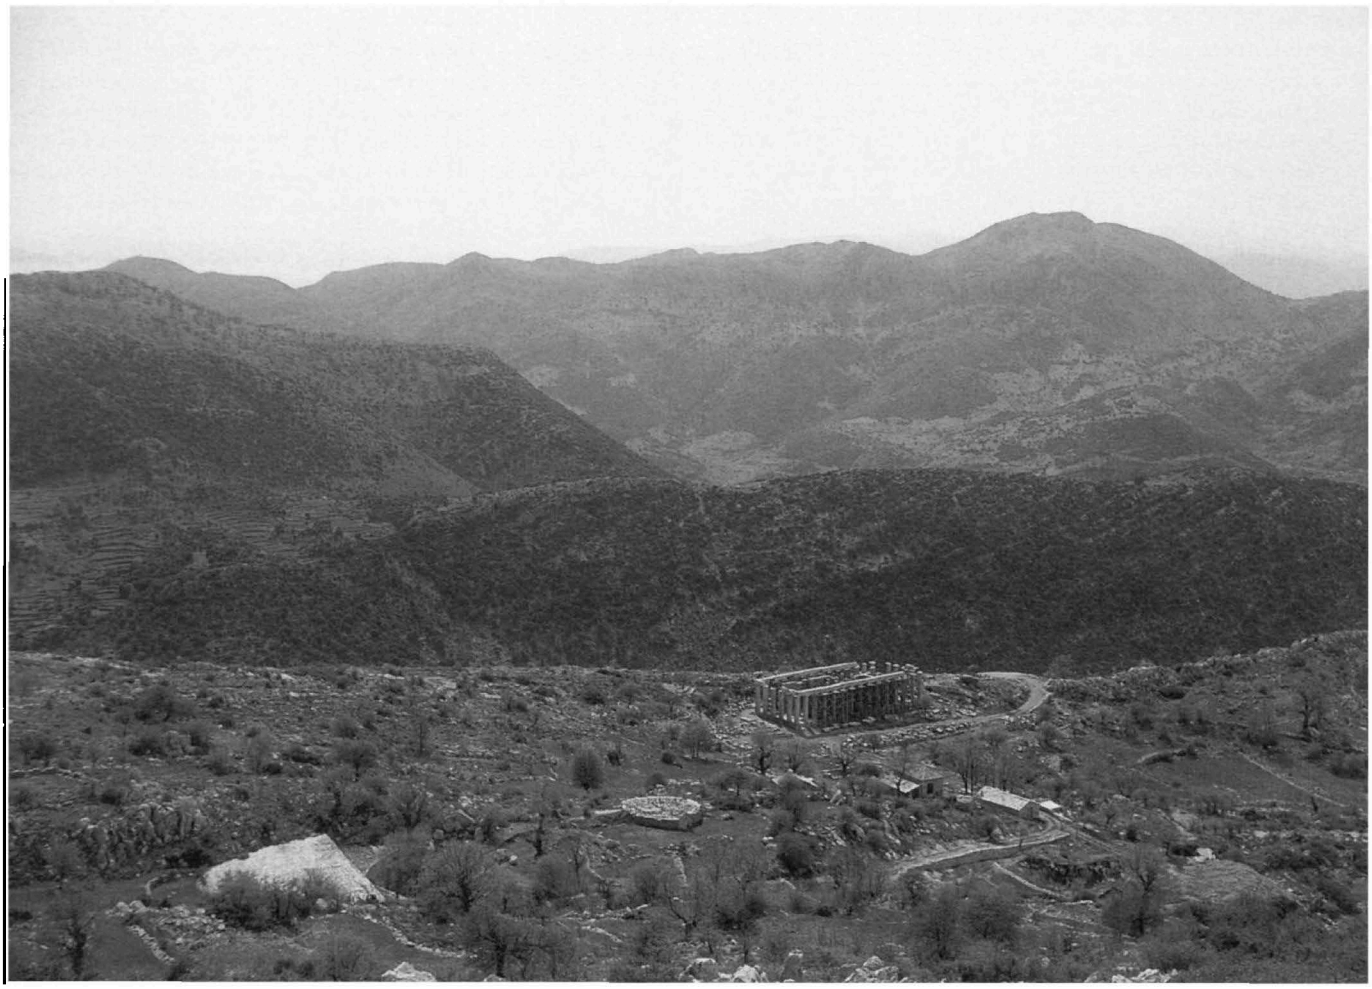
Arcadia

Region of the central Peloponnese

Arcadia is a mountainous region in the centre of the Peloponnese rising to heights of more than 2000 m. It did not gain political independence until late in the Classical period when in 366 BC Megalopolis, the "great city", was founded. But in 234 the poleis of Arcadia joined the Achaean League which became subject to the Romans. After the defeat of the Macedonians at the Battle of Pydna in 168 BC, the Romans took 10,000 Arcadian nobles as hostages to Italy; among them was Polybius, who was later to become an admirer of Roman



Arcadia: the 5th-century BC temple of Apollo at Bassae, high in the mountains of southwest Arcadia

imperialism. The destruction of Corinth in 146 BC also resulted in the end of Arcadian liberty.

Arcadia was not only a physical landscape; it became also a mental landscape ("geistige Landschaft"; as described by Bruno Snell in *Die Entdeckung des Geistes*), representing a cultural idea on which certain ideals were based. Poets of the Hellenistic period made Arcadia the scene of a charming but unrealistic poetry of shepherds and other herdsmen, chief among whom was Pan, the lewd god of the herdsmen, with the legs of a billygoat, who was always playing the panpipes. The bucolic genre, however, did not arise in Arcadia, but in Sicily (Theocritus, the Greek representative of bucolic poetry, was born in Syracuse).

It was the Roman Virgil (70–19 BC) who combined Arcadia and bucolic poetry. He knew the historical work of Polybius with its warm description of the inhabitants of old Arcadia, and he wrote the *Bucolica*. Thus Virgil founded a special genre for all European literatures.

The Italian Renaissance marked a rebirth of Arcadism, beginning with the poetry of Francesco Petrarch (1304–75), the Italian patriot and forerunner of European humanism. Influenced by Virgil, Petrarch wrote poems of minor aesthetic value, which were published posthumously under the title *Bucolicum Carmen*. But the real originator of modern Arcadism was Jacopo Sannazaro (1458–1530) from Naples, with his romance *Arcadia* (*c.*1480). Sannazaro took motifs from Virgil and other Classical writers and imagined an Arcadian golden age, in which life was full of merriment and love, far removed from the realities of rural life and Christian asceticism.

The personality of Sannazaro and his achievement had an enormous effect. In 1590 in Italy Giovanni Battista Guarini (1538–1612), a nobleman, diplomat, and professor of literature, published his *Pastor Fido*, a tragicomic pastoral drama which includes a portrait of Arcadia with strict morals and little licence, and only in the final part do we find a description of the golden age. In the territories dominated by the Venetians, such as Crete and Zakynthos, the *Pastor Fido* was issued in modern Greek. In Spain, Guarini was followed by Garcilaso de la Vega (1503–36), a soldier and writer who cultivated the Italian style in his eclogues; by the great adventurous poet Felix Lope de Vega Carpio (1562–1635), who wrote a pastoral romance *Arcadia* (1598); and by the famous Miguel de Cervantes Saavedra (1547–1616), who in 1585 published – without much acclaim – the bucolic romance *Galatea*. In France, Rémy Belleau (1528–77), a younger member of the Pléiade, published his *Bergerie* (1565), a collection of occasional poems in which personalities from public life appeared in the guise of shepherds in order to hold allegorical conversations about problems of the court and of the state – a masterly

travesty of Arcadism. In the Netherlands, Johan van Heemskerck (1597–1656), a member of the High Council of Amsterdam, wrote his often imitated *Batavische Arcadia* (1637) in order to entertain his political friends with historical and folkloric episodes. In England, Sir Philip Sidney (1554–86), a favourite of the royal court, an Oxford scholar, and a diplomat who was wounded as an officer fighting against the Spanish, wrote his romance *Arcadia* (published posthumously in 1590). He was said to be a successor of Sannazaro and included in his work (in which poetical intermezzi were introduced) the political and moral opinions of the Renaissance ruling class. In Silesia, Valentinus Theokritus translated Sidney's *Arcadia* into German (1629), and Martin Opitz (1597–1639), the famous German critic of language and literature, revised this translation which was printed posthumously in 1642.

In 17th-century Germany a form of Arcadism developed which was fed by both the Classical and the humanistic traditions. The striving for harmony, balance, peace, and quietness was an understandable reaction to the unnatural culture of feudalism. Friedrich Spee (von Langenfeld) (1591–1635) SJ was a follower of this kind of Arcadism; in his collection of poems called *Trutznachtigall*, published posthumously in 1639, he combined spiritual content with bucolic forms. The middle-class intellectuals of the town of Nuremberg made different use of the Arcadian idea. They founded a literary society named Pegnitzorden (the community of the river Pegnitz) which sought to inculcate social graces by distancing themselves from the mastersingers surrounding Hans Sachs. Their protagonist was the lawyer Georg Philipp Harsdörffer (1607–43).

Apart from literary Arcadism, which flourished in most European countries, forms of Arcadism are also found in the figurative arts. This development began in the Renaissance and was at first connected with Rome. The new feeling for nature stimulated artistic production in two ways. The first way can be described as heroic; its roots were the mythology and the architecture of antiquity. The second way was determined by literary Arcadism in all its manifestations. Landscape painting corresponded with this idea and was an ideal medium in which to display gods and nymphs, herds and herdsmen, singing and playing. A forerunner of this style was Giovanni Bellini (*c.*1430–1516) from Venice. For preference he painted biblical scenes with detailed treatment of flora and fauna. The Arcadian style was continued by Giorgio Giorgione (*c.*1477–1510) with his *Tempesta* in the Accademia of Venice and his *Slumbering Venus* in the Dresden Gallery. The acme of this artistic Arcadism was represented by the Frenchman Nicolas Poussin (1594–1665) who from 1624 lived permanently in Rome. He painted a landscape showing a tombstone with the inscription "Et in Arcadia ego" (*Les Bergers d'Arcadie*, Louvre). This motif, which demonstrates that even in Utopian Arcadia death is always present, was first treated by Bartolommeo Schedoni (*c.*1570–1614); the inscription was used in a different sense by Friedrich Schiller (1759–1805) ("I too was born in Arcadia") and Johann Wolfgang Goethe (1749–1832). The Arcadian style of painting was continued, occasionally with a Christian context, by Claude Lorrain (1615–75), Poussin's brother-in-law, and by others. But all these paintings rendered an ideal Arcadia without the benefit of the artists' inspection. Only at the beginning of the 19th century did travel to the Peloponnese become possible and regular.

It was not only writers and artists who were fascinated by the Arcadian idea. The queen of Sweden, Christina (1626–89), assembled writers, poets, and scholars at her palace in Rome in order to discuss their new works. After the death of the queen this circle became the Accademia degli Arcadi, and Canon Giovanni Mario Crescimbeni (1663–1728) its spokesman. The main purpose of the academy was to revive Italian poetry which had been subjected to barbarism in the past; its declared enemy was baroque Marinism, the form of poetry invented by Giambattista Marini (1569–1625). The members of the academy belonged to the upper classes, but women also were admitted. They had to read their poems, but "mala carmina et famosa, obscoena, superstitiosa, impia" (poems that were "evil, scandalous, obscene, superstitious, or impious") were excluded. In 1711 the academy had 1195 members and was supported by Pope Clement XI. In 1795 King John V of Portugal built the academy on the Janiculum. The academy published valuable collections of poems which influenced the aesthetics of an epoch and propagated a formal classicism. In the second half of the 18th century the academy lost much of its prestige, but it survived and still exists today as the Accademia Letteraria Italiana dell'Arcadia.

In Greece the Arcadian ideal has been cultivated for some decades by local societies and the (private) Arcadian Academy in Athens. The old ideals of combining nature and art are being revisited by the modern movement for the protection of nature and the environment.

JOHANNES IRMSCHER

Summary

The central region of the Peloponnese, Arcadia played little part in political history. Its chief city, Megalopolis, was founded in 366 BC. It succumbed to Roman rule after the destruction of Corinth in 146 BC. Its bucolic landscape however has inspired poets from Virgil to Goethe with an ideal of idyllic life, of love, and of peace.

Archaeological Service

The centuries preceding the creation of the modern Hellenic state in 1830 witnessed the destruction and removal from Greek soil of many ancient monuments and artefacts. Many antiquities suffered severe damage in times of battle, as foreign powers fought each other for the ownership of Greece, and in the more peaceful interludes, particularly during the 18th and early 19th centuries, foreign antiquarians and travellers carried home with them many prized and admired pieces of ancient

Greek sculpture and architecture. By the early 19th century, however, Hellenism and the longing to be free of the ruling hand of the Ottoman Turk were gathering momentum, and these growing feelings of national identity came to express themselves in part in a new-found pride and respect for the monuments of Hellas's great and Classical past. In 1813 the Philomousoi, a society of Greek and foreign lovers of arts and letters, was founded in Athens and when in 1821 the Greeks rose against the Ottoman Turks in the War of Independence, the Philomousoi attempted to protect antiquities from suffering any further damage and destruction.

The speed with which matters now progressed is indicative of the important place that the ancient Greek past occupied in the consciousness of the proud, new, and independent state of Hellas. By 1829 the statesman Ioannis Kapodistria had founded on the island of Aegina the first national museum, under the direction of Andreas Moustoxydis. In 1833 the Ministry of Education was established by royal decree and was charged, among other things, with the excavation, preservation, and protection of antiquities. A year later the first archaeological law entered the statute books: its aim was to maintain the Greek national heritage by preventing the illegal excavation and export of antiquities. By this law was created the nucleus of the Greek Archaeological Service, the body that has acted until the present day as guardian of antiquities. Its first general director was the German A. Weissenburg, and under him were three regional directors (L. Ross, K. Pittakis, and I. Kokkonis) who were, respectively, allocated responsibility for the Peloponnese, central Greece, and the islands. By the end of 1834 the newly formed Archaeological Service had already started work on the Athenian Acropolis to clear the site of modern houses and to raise the fallen columns of the Parthenon.

In 1837, furthermore, three years after the creation of the state Archaeological Service, the Athenian Archaeological Society was founded, a private body that also still exists. Since that time, the society has published the results of its archaeological excavations and research in its annual *Praktika* (or *Proceedings*) and *Ephimeris* (*Journal*) publications, and also since 1954 in the annual *Ergon* (or *Work*) of the society. Also by 1837 conditions were sufficiently settled to move the contents of the Aegina museum to Athens; at first they were housed in temporary quarters, including the ancient Theseum or temple of Athena and Hephaestus above the Athenian Agora. Plans, meanwhile, were made to erect a great National Archaeological Museum in the capital. The designs were drawn up shortly after the middle of the 19th century by the German architect Ludwig Lange, and its construction followed shortly thereafter, making it one of the great early European museum foundations.

As the years passed, the work of the Archaeological Service increased dramatically as the Greek national borders expanded: gradually the Ionian islands (1864), Thessaly (1880–81), and Chios, Crete, Epirus, Lesbos, Macedonia, Samos, and Thrace (1912–13) were all absorbed into Greek territory. Finally, in 1948 the Dodecanese too came under Greek sovereignty. Reflecting this expansion of geographical responsibility, an archaeological law was passed in 1910 to reorganize and expand the Archaeological Service: the service was now recognized as a department of the Ministry of Education and was to be headed by a Director of Antiquities, to whom an increased number of regional officers were to report. An Archaeological Council was also created to discuss and decide matters of particular importance. For the first time, too, the significance of Greece's Byzantine heritage was officially acclaimed by the appointment of an inspector of Christian and medieval antiquities: this was quickly followed in 1914 by the foundation in Athens of a national Byzantine museum. The archaeological law of 1910, and another of 1932, still serve to protect and preserve antiquities in Greece.

Throughout both the Graeco-Turkish war of 1920–22 and World War II, the Archaeological Service continued to fulfil its role as the guardian of Hellenic cultural heritage. During the hostilities in Asia Minor it oversaw the transfer of antiquities to Smyrna for safe keeping from abandoned archaeological sites in the surrounding region, and also conducted the excavation of sites such as Nysa on the Maeander and of the Byzantine church of St John at Ephesus. At the time of the German occupation of Greece, the contents of Greek museums were saved from damage and looting by the passionate dedication of the archaeologists, who emptied their exhibition galleries and hid the antiquities with great ingenuity. Following World War II, much was done to reorganize the national and, by now, numerous regional museums, and from 1950 the archaeological laws were extended to protect monuments and works of art post-dating 1830.

As it exists today, the Archaeological Service forms a major department of the Greek Ministry of Culture. The investigation, care, and presentation of sites and areas of archaeological and historical importance, and of the antiquities and works of art housed in the Greek museums, are divided between three main divisions of the service: Prehistoric and Classical Antiquities, Byzantine and Postbyzantine Antiquities, and Modern (post-1830) Monuments. These three main departments are subdivided into regional units, responsible for archaeology and museums in their particular locale. The Central Archaeological Council in Athens, nevertheless, has ultimate control. A special branch of the service also deals with conservation and restoration matters, and additional departments oversee underwater archaeology, caves and palaeoanthropology, private collections, and the archaeological fieldwork activities of Greek universities and of the foreign archaeological schools and institutes based in Athens. One of the main tasks that falls to the regional units of the Archaeological Service is the oversight of all development and construction work in their districts, which may either uncover ancient remains or affect listed buildings: areas found to be of archaeological importance during, for example, the course of digging new building foundations must, by law, be subjected to rescue excavation by the Archaeological Service. If the antiquities are found to be of particular significance, the modern development work may be completely and permanently halted, the area declared an "archaeological zone", and the land expropriated for state ownership.

Greece is richly strewn with the debris of its past, a factor that today is both a source of great national pride and a valued asset in its development of cultural tourism. However, the demands of antiquity on the present are considerable: the conservation and partial restoration of the major standing

monuments, such as those of the Athenian Acropolis, and the development and construction of new museums for the ever-expanding treasury of excavated antiquities require longterm planning and the commitment of national finances. Furthermore, the sheer weight of archaeological finds and discoveries loads the archaeologists with a heavy burden and backlog of material to be studied and published: the Archaeological Service's annual publications, *Archaiologikon Deltion* (*Archaeological Bulletin*) and *Archaiologika Analekta ex Athinon* (*Athens Annals of Archaeology*), therefore announce recently discovered material in summary form until it can be published in full. But, for all the difficulties of management that Greece's past poses for its present, the soul of modernday Hellas is, nevertheless, entwined inextricably with its past: incidences of the repatriation to Greece of antiquities removed at some earlier date are, for example, often occasions for national rejoicing. As this article is written, a new, comprehensive, and updated archaeological law is in preparation. Its provisions aim to ensure that, as Greece moves forward into the new millennium, the nation's rich cultural heritage will be well protected, investigated, and managed on behalf of present and future generations.

Archaeology

Our knowledge of Greek culture was originally derived from written documents, historical texts, and other literature, transmitted through the Middle Ages and the schools of Constantinople. It was largely the dispersal of Byzantine manuscripts to the west that led to the revival of interest in ancient Greece and its achievements, and the development of Classical Greek studies as a fundamental part of western education. At the same time, the conquest of Greece by the Ottoman Turks made Greece difficult of access, and Greek remained essentially a matter of book learning. Travellers such as Cyriac of Ancona, who visited and recorded surviving monuments in the mid-15th century, were most exceptional.

During the 18th century there was a considerable development of interest in the physical remains of antiquity, particularly in Italy. Antiquities were collected by wealthy aristocrats making the Grand Tour, and excavation was carried out at ancient sites, above all Pompeii. The Greek remains in southern Italy, especially the temples at Paestum, came to be known, appreciated, and even copied (e.g. the columns in Joseph Bonomi's church of St James at Great Packington in Warwickshire, of 1789–90). More crucially, in 1751 the aristocratic Society of Dilettanti sent James Stuart and Nicholas Revett to Greece itself, to produce accurate measured drawings of the ancient Greek buildings in Athens and elsewhere, as exemplars for Greek Revival architecture. This was a real stimulus to antiquarian interest in the material remains of ancient Greece, even if there was in all this much of the approach that can be summarized as "Fair Greece, sad relic". From this time there was a steady stream of artists and architects visiting Greece to record the monuments.

All this was transformed, if slowly, by the War of Independence and the freeing of at least part of Greece. The recovery of the material evidence for ancient Greek culture now became a fundamental aspect of the national heritage, and even as Karl Friedrich Schinkel was producing plans for his "dream palace" to house the Bavarian king Otho on the Acropolis of Athens, Kyriakos Pittakis (the brother-in-law of Theresa Makri, Byron's Maid of Athens) was struggling to recover and preserve the fallen and scattered fragments of Classical buildings and sculpture as the Turkish structures there were demolished. The new Greek state passed its law of 10/22 May 1834 that concerned the uncovering and conservation of antiquities. Already, in 1829, Kapodistria had established the Archaeological Service, and in 1833 Adolf Weissenberg had been put in charge of "the conservation, discovery and collection of the archaeological treasures of the Kingdom", with Pittakis responsible for northern Greece, J. Kokkonis for the islands of the Aegean, and Ludwig Ross for the Peloponnese. In 1837 came the foundation of the Archaeological Society of Athens.

Their work was undoubtedly hampered by the poverty of the newly independent state. At first there were very few purpose-built museums (that on Aegina was one of them). At Athens antiquities were stored in the Theseum (temple of Hephaestus), in the Propylaea, in a Turkish cistern in front of the west end of the Parthenon, and in a Turkish house behind the Erechtheum. Conservation work was often crude; although the temple of Nike was resurrected from the Turkish gun bastion into which it had been incorporated, the patching of the Erechtheum was elementary, while the north wall of the Parthenon was supported by a rough and intrusive structure of brickwork.

Into this context came the foundation of the foreign schools, beginning with the French in 1847, which brought much greater resources to the development of Greek archaeology, whether state-supported or funded by wealthy individuals. There was increasingly a new approach, the transformation from collection and antiquarianism to scientific archaeology. Already in the 1850s Charles Newton was emphasizing, in his proposals to excavate the Mausoleum at Halicarnassus, the need for a proper archaeological approach (which he achieved with the recording of his work, including the use of photogra-

phy), even though, by digging in what was still the Ottoman empire rather than Greece, his main purpose was to acquire material for the collections at the British Museum. At the same time, significantly, he was stressing the need for archaeology to be recognized as an essential element in the study of Greek civilization.

From this time, archaeology has transformed our knowledge of Greek culture. In many ways, the most significant single development has been the discovery and ongoing interpretation of Greek prehistory. Excavations at the major prehistoric sites, on the mainland at Mycenae, Tiryns, Pylos, and a whole host of other places, together with those on the island of Crete, have revealed a complete new world of Greece before the Classical Greeks. The discovery at Knossos, Pylos, and elsewhere (most recently, under the streets of modern Thebes) of the Linear B tablets, and their brilliant decipherment in the 1950s by Michael Ventris, has brought us knowledge of the Greek language at a stage more than 500 years earlier than Homer, and with this an understanding of Greek society in a different form, centuries before the evolution of the Classical city states. It has shown us, too, the pre-Greek world of Crete, on top of which the prehistoric Greeks developed, and has enabled us to trace its formative elements from Egypt, the Near East, and Asia Minor. None of this was known before the excavations of Heinrich Schliemann, Arthur Evans, Carl Blegen, and many others.

Turning to the Classical period, archaeology has broadened immensely our knowledge of the Greek world at that time. In Athens we can now see the Agora, not just read about its involvement in the affairs of the city. We no longer have to rely on Thucydides' assurances to understand the physical contrast between the cities of Athens and Sparta. Even things of little significance in themselves make our understanding of the Classical world more real and vivid: we can now actually see the gash made in the forehead of Philip of Macedon by the arrow that removed the sight of one of his eyes at his siege of Methone; but more significantly, in the material that was buried with him in his vaulted tomb at Aegae/Vergina we can see something of the luxurious wealth that characterized his royal existence in the palace at Pella (whose plan itself has been revealed in recent excavations). Beyond the Classical period, archaeology traces (more clearly than the broken written record) the essential continuity of the Greek world; more attention than previously is paid to post-Classical remains, for example, in the excavations at Corinth.

The contribution of archaeology to our understanding of Greek culture can be divided into two broad categories: first, the recovery of actual material from the earth, and secondly its interpretation. Recovery is not confined to excavation. Surveys of extended areas, the study of the distribution of artefacts over the ground, give information about settlement patterns outside the obvious city sites, and their variation at different periods of Greek history, down to the present day. The study of surface evidence, as well as that from excavation, has given us the street plans of innumerable Greek cities. We can now see not only the great temples of the major religious sanctuaries, but also places of lesser, or even completely minor cults, and thereby understand more of the place that these cults had in the lives of the ancient Greeks. It is possible to see more of the workings of the cults, the objects deposited as offerings, the buildings associated with religious practice, often specialized such as those provided – for a select minority – for the ritual feasting that was an essential element of Greek religion. Archaeology has extended our documentary evidence for Greek civilization, above all the discovery and recording, already started by Cyriac of Ancona in the 15th century, of inscriptions. The range of these is immense: they include major historical events, such as the evacuation of Athens at the onset of Xerxes' invasion (though this inscription is later than the event, and raises problems of interpretation). From inscriptions we have the oath sworn by the founders of Thera's colony at Cyrene, records for building the temples at Athens, and of the development of the sanctuary of Asclepius (and thus the Asclepius cult) at Epidaurus. We can assess the tribute paid by the dependent states of Athens' empire, and read the lists of property confiscated from those who mutilated the hermae on the departure of Athens' doomed expedition to Syracuse. Excavation in Egypt, whether organized or, to use a euphemism, commercial, has produced the texts of literary works that did not survive the rigorous exclusions of Byzantine copying, but also more personal documents, bills, receipts, even the private letters of the Greeks in Hellenistic and Roman Egypt. The list is never-ending.

In short, archaeology has shown the complete context in which Greek civilization developed and flourished, as well as its periods of decline. It has given us a first-hand knowledge, not easily recoverable from other sources of information, of Greek art and architecture (which is Classical archaeology in its original meaning). Though much has been lost, discoveries are still accumulating. Without archaeology we would have no visual knowledge of the sculptures that decorated the temple of Zeus at Olympia, or of the marble masterpieces dedicated on the Acropolis of Athens in the 6th century BC and buried after their desecration at the hands of Xerxes' soldiers in 480 BC. Even if chance finds have given us the powerful bronze god (surely Zeus) fished up off Cape Artemisium, or the Riace warriors, plausibly if not with certainty attributed to Phidias himself, it is the techniques developed for the conservation of antiquities that have restored and stabilized them. The literary sources – such as Pausanias – tell us of important paintings, and tantalize us with their descriptions of lost masterpieces; archaeology has restored to us at least the masterpieces painted on the walls of the royal tombs at Vergina, revealed in the late 1970s by Manolis Andronikos, their colours as fresh as the day they were painted, their style compared by their discoverer with that of the old masters. These same graves, and others elsewhere, both in and beyond the Greek world, have produced for us splendid examples of Greek metalworking, in gold and silver as well as bronze, of which there are otherwise only the dimmest echoes in the ancient written sources.

Archaeology has also recovered much of the everyday aspects of Greek civilization. We now have examples of the houses in which the Greeks lived, generally reduced to foundations and footings, but with some better preserved, and certainly with more evidence to show what they were like when they were intact, ranging in date from the prehistoric to the present day, and from all levels of society. Archaeology has uncovered much of the paraphernalia of everyday life, or at least that which was not made of perishable materials (in rare circumstances, even this has survived). The painted vases, too,

illustrate not only legends and mythology, but also scenes from everyday life – in the house, at school, at the workplace, at the bottom of the mines, in the exercise grounds of the gymnasia. They show us the drinking parties, as well as the fun and games that went on there. But they also help to fill out our knowledge of contemporary houses, for they illustrate the furniture – couches, chairs, chests – and the way that objects were hung on the walls of the feasting rooms.

More specialized aspects of archaeology give us further information. Underwater research has been particularly rewarding, starting with the finds dredged up, like the Artemisium *Zeus*, by fishing nets, but more recently developing, thanks to advances in diving technology, into a branch of scientific research that not only locates wrecks but investigates and records them in every detail. The identification of such wrecks, and their cargoes, of all periods, has produced much information on patterns of trade in Greek waters, and wider afield in the Mediterranean. It has even led to the recovery of the remains of ancient ships, particularly the 4th-century BC Kyrenia wreck, which has given us information about the relative longevity of ordinary small trading vessels, and, most invaluably, about the technique of ship construction.

With archaeology go the scientific techniques developed to assist in interpretation. Analysis of pollen, seeds and other vegetable remains in soils and in rubbish pits tells us about crops and diet. Analysis of pottery fabrics tells us where they were made, including the plain wares that were, with their contents, an important part of the export trade of Greece. If our understanding of the Greek world, from the beginning to the present day, is so much wider now than it was a century ago, or compared with the time when the texts were our only source of information, it is archaeology that has made the difference.

Archaic Period *c.*700–479 BC

The Archaic period of Greece, which follows the Geometric and precedes the Classical period, is traditionally dated *c.*700–479 BC, for the Geometric style of pottery decoration ends and Orientalizing styles appear around 700 BC, while the end of the Persian Wars in 479 BC marks a significant turning point in Greek history. Some, however, especially archaeologists, like to distinguish the first 100 years of this span (*c.*700–600 BC) as the Orientalizing period, and others prefer to start the Archaic as early as *c.*750 BC so that its beginning coincides with the Greek renaissance. Some recent scholars would also like to end the Archaic period *c.*500 BC, somewhat earlier than the traditional date of 479.

The Archaic period is marked by some of the greatest achievements of the Greeks, visible in such diverse areas as pottery and sculpture, the architecture of the great temples and sanctuaries, lyric poetry, philosophical speculation, and the shift to new forms of political organization. In most respects these achievements were the direct result of developments begun at the time of the Greek renaissance from *c.*750 BC on. The great colonization movement that had begun then continued during this period. Most of the Greek colonies had been established in the west by 650 BC and in southern Italy and Sicily later became known as Magna Graecia because of the large number of newly established Greek settlements there. The Greeks, however, also went further afield, into France and Spain, North Africa and the Near East, and, in fact, the colonization movement did not end until about the middle of the 6th century BC.

This was an era of great thinkers and writers. In Ionia Greek philosophy was born. Thales, Anaximander, and Anaximenes, all from Miletus, sought answers to profound philosophical questions, but elsewhere other schools evolved, each with its own ideas and followers, and significant advances were made in science and mathematics. In literature lyric poetry replaced epic poetry; instead of sweeping accounts of gods and heroes as in Homer's *Iliad* and *Odyssey*, this was personal, often very poignant poetry, filled with the range of human emotions. Archilochus, Alcman, Mimnermus, and Sappho all wrote at this time.

The shift in poetic style can be seen as a symptom of this new age, which was a time of political and social transformation. The poleis – the city states – were now consolidated, but the era was one of turmoil and revolution, as well as of greater individualism, as the work of the lyric poets demonstrates. At the beginning of the 7th century BC city states were typically ruled by aristocracies that were generally quite conservative in outlook and, in some respects, greedy and corrupt. Time had come for change, however, and in many city states this meant the adoption of tyranny. The first tyranny on the Greek mainland was in Corinth, where Cypselus took power from the noble Bacchiad family in the 650s BC, and most of the other major states followed suit, with the notable exceptions of Sparta, where two royal families continued to rule, and Athens, where tyranny came relatively late – in the mid-6th century BC.

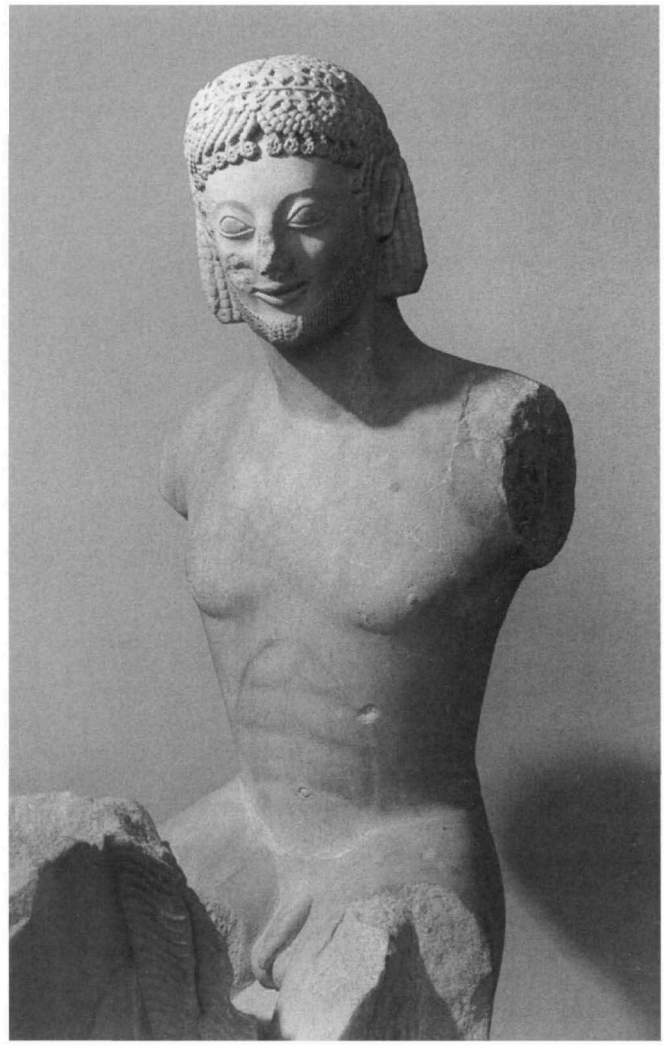
The 7th century BC also represents a time of significant change in artistic style. This was the so-called Orientalizing period, when Greece accepted much influence from its eastern

neighbours. It was the heyday of Corinth and it was there that the Geometric style first came to an end (*c.*720 BC) to be replaced by a new Orientalizing ware known as Protocorinthian. Both incision and polychromy were used to great effect and new motifs, generally inspired by the east, made their appearance on the pottery: floral motifs were employed, as were representations of real and imagined creatures such as lions, sphinxes, and griffins. Corinthian artists are especially known for their miniature pots; exquisitely decorated and filled with oils and perfumes, these were bound for export not only within Greece itself but also to the colonies, and they attest the pre-eminent economic position enjoyed by Corinth at this time. By the later part of the 7th century BC, however, Protocorinthian pottery became mass produced, a victim of its own success, and with this a noticeable change, not to say decline, set in. By the time that the so-called Corinthian ware (the successor of Protocorinthian) had established itself towards the end of the 7th century BC, Corinth's position of wealth and economic dominance was waning and would soon be eclipsed by Athens, whose fortunes were on the rise.

The Orientalizing period also saw the appearance of the type of sculpture known as Daedalic. The eastern, particularly Egyptian, characteristics of such sculpture are obvious in the very stiff frontal pose of the figures, depicted with arms at their sides and heads with triangular faces, low foreheads, and stylized hair. These statues were the forerunners of the famous *kouroi* (male) and *korai* (female) statues of the 6th century BC.

Sculptures are often associated with sanctuaries that themselves grew and prospered throughout the 7th and 6th centuries BC. An emphasis on public religion had begun in the geometric period, but it was in the 7th century BC that the temple became the religious focus of poleis all over the Greek world. Essentially a home for the deity, the temples, which had started life as wood or mud-brick constructions, some as early as the 8th century BC, were now built of stone and followed newly defined rules of architecture – the Doric and Ionic canons. The typical Greek temple comprised three rooms and had a colonnaded porch that surrounded the building. Besides the individual temples built in the poleis there were also the great Panhellenic sanctuaries that received worshippers from all over the Greek world and which were also venues for various types of competitions, particularly athletic and musical ones. The most famous of these sanctuaries were Delphi and Olympia, but others, such as Isthmia, Nemea, Delos, and Dodona, also enjoyed widespread renown. Delphi was known particularly for its oracle of Apollo and it acquired great prestige with visitors coming from all over Greece to receive advice and offer dedications there. Dedications, such as large bronze tripod cauldrons and figurines, demonstrate the popularity already enjoyed by Olympia in the later part of the Geometric period. As the home of the Olympic Games, the first celebration of which is traditionally dated to 776 BC, Olympia came to achieve a very prestigious position in the Archaic period. Treasuries as well as various other buildings, both religious and secular, were erected throughout the Archaic period at both sanctuaries.

In sculpture the 6th century BC was the time of the *kouroi* and *korai* which may, in general, be described as idealized portraits of young adults, the *kouroi* being nude males and the



Archaic Period: marble horseman from the Acropolis at Athens, possibly representing a victor in the Pythian Games.

korai clothed females. Normally the *kouroi* stand stiffly, one leg slightly forward and their arms held tightly at their sides and, on their faces, the famous Archaic smile. These stone statues, many of which acted as grave markers, are often life-size or larger, but their features are not sufficiently distinct to be intended as individual portraits of the deceased; these are men shown in the prime of life – an idealization of manhood. With the *korai* the situation is somewhat different: many appear in sanctuaries as dedications and, while identification remains problematic, it is felt that some may represent votaries. The *korai,* which also show the Archaic smile, are normally clothed, and various colours are used to highlight clothing, hair, jewellery, etc. While these statues are very stiff and block-like when they first appear, the sculptors gradually develop a softer approach in their work and, by the Classical period, have achieved a great degree of naturalism.

One of the major developments of the 6th century BC was the re-emergence of Athens as the leading state after having lost its pre-eminence to Corinth for about a century. This dominance is seen archaeologically in the appearance of Attic black-figure pottery which succeeded the proto-Attic style of the 7th century BC, itself characterized by Orientalizing motifs

and an abandonment of Geometric conventions. The Athenian black-figure ware of the 6th century BC managed to surpass the Corinthian ware of that period and became as popular and widely exported as the Protocorinthian had been in the 7th century BC. Incision was used with such exactness and delicacy that finely detailed paintings were possible. Quite apart from the technical excellence of the pottery, the scenes that the painters chose have been an enormous and valuable source of information about all aspects of life, for Athenians are shown engaged in various everyday pursuits. Grape and olive picking are depicted, for instance, as are pottery making, sculpting, feasting, taking part in the Panathenaic Games (horse racing, wrestling, javelin throwing, etc.), going to school, and so on. Moreover these scenes have afforded glimpses of clothing and furnishing styles, of architectural details, and much more. Mythological scenes were also very popular and feature exploits of a number of heroes and deities such as Achilles, Ajax, Heracles, Athena, Poseidon, Dionysus, and the like. Signatures on the pottery help to identify individual potters and/or painters; among the most famous are Exekias and Amasis, both of whom were active in the 6th century BC.

Politically, too, Athens underwent great changes in the 6th century BC as the aristocrats were challenged, and although attempts at reform were undertaken, most notably by Solon in 594 BC, tyranny was established by Pisistratus in the late 560s BC. After twice being expelled, Pisistratus was able to take over power and command Athens until his death in 528/27 BC. Under his rule Athens flourished and, like his earlier Corinthian counterparts, he also patronized the arts and literature and did much to foster Athenian trade, commerce, and industry. The Acropolis became the centrepiece of Athens as the temple of Athena, the predecessor of the Parthenon, was begun. In general Pisistratus' reign was thus a time of peace and prosperity, but when his two sons took over power in 527 BC the character of the tyranny changed and became oppressive after one of them was murdered. The tyranny was finally overthrown in 510 BC and, two years later, in 508 BC, the Athenians developed a new type of political system, democracy, under the leadership of Cleisthenes. This gave the Athenian citizen a direct say in running the state. It should be noted, however, that women were excluded from this process. The polis system, and in Athens democracy itself, was male-dominated and women were segregated and confined to specific gender-related and socially acceptable roles. The rules governing the role of women varied, however, according to class and status as well as from place to place; in Sparta, for instance, women enjoyed a much freer lifestyle as a result of Sparta's particular social system.

The end of the Archaic period is marked by the onset of the Persian Wars (490–479 BC), caused by the expansionist policies of the Persians. In these wars the two great Persian kings, Darius and then Xerxes, were defeated by a coalition of Greeks, although the brunt of the offensive was borne by Athens and Sparta. After the extraordinary naval victory of the Athenians at Salamis in 480 BC, the battles of Plataea and Mycale the following year mark the end of the Persian threat in Greece.

Summary

Dated *c.*700–479 BC, the Archaic period follows the Geometric and precedes the Classical. It is marked by developments in pottery and sculpture, the architecture of temples and sanctuaries, lyric poetry, philosophical speculation, and the shift to new forms of political organization. It ends with the final defeat of Persia at the naval Battle of Mycale in 479 BC.

Archilochus

Lyric poet of the 7th century BC

Archilochus was born to an aristocratic family on Paros in the early 7th century BC, and his career and poetry exemplify trends in the Greek world during a period of great change in traditional social structures and attitudes. This was the era of Greek colonization and exploration in the Mediterranean and beyond, and Archilochus was a soldier and a wanderer, politically active, and involved in the later stages of the colonization of Thasos begun under his father, *c.*680 BC. Like Hesiod and the early lyric poets, his poetry moves away from the impersonal tone of Homer to one in which the individual is more prominent. The poetic persona that emerges from surviving fragments is consistently passionate, tough, practical, and impatient with pretension and traditional values: he appears as a devotee of war, poetry, women, drink, and, above all, survival.

Much of Archilochus' style and language is Homeric: no early poet could escape the influence of Homeric formulaic language, although Archilochus himself probably composed in writing rather than orally. Different from Homer is much of its subject matter and tone. The world of proud heroes and elevated expression gives way to one where the humbler details of subsistence in a harsh environment, quite absent from Homer, are given as much attention as loftier themes. One notorious poem records the loss of the poet's shield in combat with barbarians: the poem seems unbothered by what should have been a shameful loss – "let it go, I'll get another one just as good." Later sources allege that Archilochus' works were banned from Sparta because of such unsuitable content. Far away is the Iliadic view of death as a worthy end in itself: Archilochus' view is more that of an adventurer who fights for survival, not for glory and death. While such poems strike a new and un-Iliadic note, their atmosphere is not utterly dissimilar to that of the *Odyssey*, and Archilochus' persona resembles Thersites' in some respects. Very Odyssean is one poem in which he encourages his heart "neither to rejoice too much in delights nor be too vexed in troubles, knowing what sort of rhythm possesses man". His attacks on grandiosity and pretension are sometimes thought to reflect a newer, more egalitarian spirit in the newly founded city states of the Archaic age.

Ancient critics consistently link Archilochus with two great predecessors, Homer and Hesiod. His literary power is said to resemble Homer's; his attitudes and subjects are closer to Hesiod's, though he takes his individualism to a greater extreme. He is also the earliest Greek poet to write specifically about sexuality, sometimes using obscenities that are entirely missing from Homer or Hesiod. He was especially famous in antiquity for an abusive iambic poetry whose forerunner was the apotropaic ritual abuse associated with the rites of Demeter, with whom iambic verse itself seems to have had a particular connection. Paros had an old Demeter cult with which Archilochus' family may have been connected. Such traditions also influenced mock-epics such as the *Margites*, and Aristotle makes iambic verse the antecedent of comedy. The obscenities in Archilochus can be remarkably mingled with tender romanticism, and this uniquely dual tone has made him very popular with moderns. In none of his poems is this duality more noticeable than in an unusually long fragment (Page, *Supplementum Lyricis Graecis*, 5478) in which an unidentifiable speaker tries gently to persuade a young woman to make love with him – when she suggests that her sister Neobule is more suitable for him, he abuses Neobule, calling her oversexed and past her prime.

The poem was a particularly important discovery, because of the most famous tradition about Archilochus. According to later sources, he was engaged to be married to Neobule, but when her father Lycambes broke the engagement off, he assailed the family with verses so vicious that they eventually hanged themselves. Nothing specific about the betrothal is found before Horace, but evidence from fragmentary comedy (Cratinus) suggests that the story was well known in 5th-century BC Athens. While some suspect that the story is fictional and derives from misunderstood ritual abuse, the names Lycambes and Neobule do appear in the fragments, and archaeological evidence has proved the reality of some others of Archilochus' addressees. Parian inscriptions indicate that both Archilochus and Lycambes were from leading families, and thus a proposed alliance between the two is plausible. Some of the Lycambes poems were expressed as beast fables, a form derived from Asia Minor that first appears in Greek literature in Hesiod, and later in Aesop. In these, Archilochus could give full rein to his anger while appearing detached and sardonic.

Archilochus' reputation abroad was that of a dangerous, angry man, but within Paros he posthumously acquired an almost heroic status. An inscription of the 3rd century BC describes an Apolline command to honour Archilochus along with the Muses, Apollo, Dionysus, and others, in a place dedicated to his memory. While it admits that the Parians banished him for his abuse, it also mentions the mass attack of impotence sent on them by Dionysus as a punishment for the banishment, and portrays Archilochus as a poet under divine patronage, whose immortality was prophesied to his father by the Delphic oracle. A later inscription, a biography of Archilochus by Demeas (a Parian historian of the 4th century BC), records his death in battle against the Naxians. Such inscriptional evidence tells of participation in embassies and battles, and the Parians apparently remembered him as more community-minded than his fiercely individualistic reputation would suggest: only a few fragments of songs with a community emphasis now remain.

The brilliant violence of his verses brought him admiration for his talent and condemnation for his subject matter in equal measure. Pindar condemns Archilochus' anger as unattractive and unproductive, but he was popular in 5th-century BC Athenian comedy: his apparent rejection of establishment values and pretension made him attractive to the democracy. Plato mentions him in the company of Homer and Hesiod, but does not recommend his writing as edifying. He was the subject of treatises by Heraclides of Pontus and Aristotle, and the Alexandrians included him in their canon of iambic poets along with Semonides and Hipponax. Apollonius Rhodius wrote a book about him, and while Callimachus mentions his ferocity with apparent disapproval, his own iambics were a kind of Archilochean revival. Aristophanes of Byzantium and Aristarchus of Samothrace wrote commentaries on the poems, but unsurprisingly they were omitted from the educational

syllabus of later antiquity because of their tone and subjects. Archilochean papyri date from the mid-3rd century BC to the 3rd century AD. The early Church Fathers preserve some references and quotations: for them, Archilochus was undeniably great but a thoroughly bad character, all too typical of pagan behaviour. The emperor Julian forbade priests to read his work. It is probable that his poetry survived plentifully at least to the 5th century AD, but after Eusebius little is heard of him for the next few centuries. It is hard to know how much survived as far as Byzantium: such quotations as we have may well derive only from anthologies. The first Renaissance edition of his poems is Henri Estienne's *Carmina Poetarum Novem Fragmenta* (Paris, 1560).

SOPHIE MILLS

Biography

Born on Paros in the early 7th century BC to an aristocratic family, Archilochus left in disgrace for Thasos where he became a mercenary, eventually dying in battle against the Naxians. Probably the first major literate poet of the Greek world, he was ranked with Homer and Hesiod by ancient critics; but there is far more passion in his verses than in those of his predecessors.

Archimedes *c.*287–212/11 BC

Mathematician and inventor

Archimedes was killed in the Roman sack of Syracuse in 212 or 211 BC, which gives us one of the few firm dates in the history of ancient science; if, as a 12th-century Byzantine author reports, he was 75 years old at the time of his death, he would have been born around 287 BC. His father, Phidias, was an astronomer, so that for Archimedes science was the family trade. He came from Syracuse, and did most of his work there, at the court of king Hieron II (and at least some of his writings were originally composed in the Doric dialect spoken in Syracuse); he also seems to have spent some time in Alexandria, and corresponded with the mathematicians Conon, Eratosthenes, and Dositheus, who were based there.

Both in antiquity and in the modern world Archimedes has principally been famous for two reasons: because of the ingenious mechanical devices he is alleged to have discovered; and through anecdotes representing him as the archetype of the scientist so absorbed in his work that he forgets about ordinary life. So it is reported that he would forget to bathe, and when his friends persuaded him to do so he would draw geometrical diagrams in the oil on his body; his death in the sack of Syracuse is said to have been brought about because he was so preoccupied with a geometrical problem that he spoke rudely to the soldier who came to capture him; most famously, while in the bath he reached a solution to the problem of how to find out whether gold that had been given to a craftsman to make a crown had been adulterated with silver, and was so excited that he forgot himself and ran naked through the street shouting "I have found it!" He is credited with the invention of a number of ingenious engineering devices. He is said to have supervised the construction of a massive 4,200-ton ship for Hieron II, and, when it was finished and no one knew how to launch such a large vessel, he supposedly devised a system of pulleys by means of which he was able to move it single-handed; this is of course impossible, because real pulleys (as opposed to mathematical concepts) waste energy through friction, and the whole story is perhaps a fiction designed to illustrate his work on mechanics, and particularly his saying "Give me somewhere to stand and I will move the world." Better attested is his construction of a number of moving models of the celestial sphere. He was also reputed to have invented the Archimedean screw (a device for raising water) and a hydraulic organ. The difficulty that the Romans had in capturing Syracuse was explained by the formidable defence put up by the war-engines devised by Archimedes. In itself this is quite plausible, since in the Hellenistic and Roman periods mathematicians were involved in the construction and use of such machines as catapults. The account was, however, embroidered as time went on, and by the 2nd century AD we are told (by Galen) that he used burning mirrors to set on fire the Roman ships. The story became a favourite one for Byzantine writers, and indeed we are told that in AD 514 the philosopher Proclus used exactly the same technique to drive the fleet of Vitalian away from Constantinople. Though the report is not plausible, and is surely based on inferences from Archimedes' work on the geometry of optics, repeated attempts have been made to show that the device could work (most recently by a Greek journalist, whose practical demonstration, though spectacular, failed to convince sceptical historians that a burning mirror could be made into a practical weapon of war).

Archimedes' interesting eccentricities, and his engineering achievements, tended to obscure the importance of his mathematical work. So when the Roman Cicero, as quaestor in Sicily in 75 BC, rediscovered the tomb of Archimedes overgrown with thickets outside Syracuse, he reported that it carried on it a representation of a sphere and a cylinder. He seems, however, to have had no idea that this represents Archimedes' discovery

of the ratio of the volume of a cylinder to that of a sphere inscribed within it (*On the Sphere and Cylinder*, 1. 34). Archimedes, in fact, was not only a great mathematician, he is also the only one of the truly creative mathematicians of antiquity whose work survives to any extent (since the surviving writings of Euclid and Apollonius of Perge are largely systematizations of the work of their predecessors). In pure mathematics, his greatest work is probably *On the Sphere and Cylinder*, on the volume and surface area of spheres and segments of spheres. Other works in the same field are: *On Conoids and Spheroids*, which deals with the solids created by the revolution of conic sections; *The Quadrature of the Parabola*, which is on the area of parabolas; *On Spirals*, dealing with the geometry of the so-called Archimedean spiral; and *The Measurement of the Circle*, which calculates upper and lower limits for the value of p. In these works Archimedes uses the methods of his predecessors, and especially Eudoxus' "method of exhaustion" with great ingenuity, and sets out his results in traditional Euclidean form. Another surviving treatise, *The Sand-Reckoner*, purports to be a calculation of how many grains of sand it would take to fill the universe, but is actually a demonstration of a method of writing very large numbers using base 100,000,000. He extended the scope of mathematical method by applying it to statics in *On the Equilibrium of Planes* (on centres of gravity and the theory of the lever) and to hydraulics (a subject he seems to have invented) in *On Floating Bodies* (known only in Latin translation until a Greek text was discovered in 1899).

Archimedes' account of his work in the prefaces to his treatises makes it clear that the discovery of a mathematical proposition, and the method by which it was discovered, was quite separate from the presentation and publication of the proof in Euclidean form. In 1906 a previously unknown work of Archimedes, *The Method*, was discovered in Constantinople on a parchment of the 10th century, which had been partially erased so that a Euchologium could be written over it. In this work Archimedes shows how he originally discovered a number of the propositions that are set out in Euclidean form in his other works. He treats figures as combinations of infinitely thin strips, to which the methods of mechanics can be applied, and to some extent anticipates the methods used by the discoverers of calculus in the 17th century. Archimedes himself regarded the method as insufficiently rigorous (and so published proofs in more traditional form). The discovery of this work gives us a rare opportunity to see one of the greatest creative minds of antiquity in action.

Some time in late antiquity (probably in the 6th century AD) the more elementary of Archimedes' works (and in particular *On the Sphere and Cylinder* and the *Measurement of the Circle*) were translated from Doric into Attic Greek, presumably to make them more accessible to readers. This development may be associated with the school of Isidore of Miletus (one of the architects of Hagia Sophia in Constantinople), and is evidence of the continued use of at least some works of Archimedes in education. It was, however, not until the 9th-century revival of the study of mathematics in Constantinople that a proper collection of his works was made, which is the basis of the texts we have today.

RICHARD WALLACE

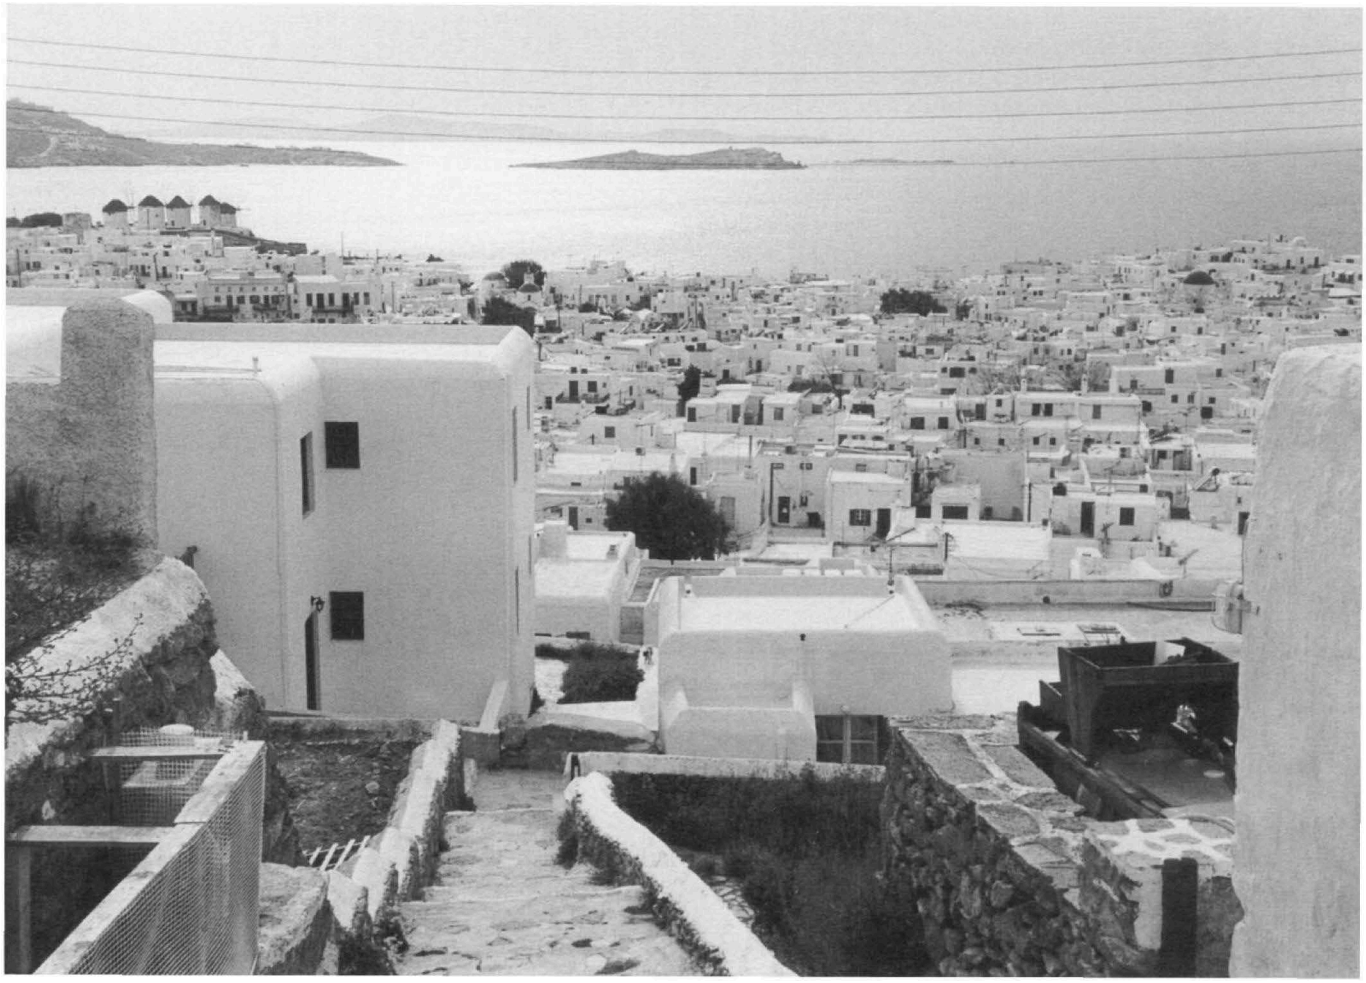
Architecture

Domestic

Domestic architecture describes the space in which people live as private individuals and, generally, as part of a nuclear or extended family. Houses, often the least documented buildings in history, are part of an organic architectural fabric that over time continuously changes and adapts to the inhabitants' ever-evolving needs and desires. Houses are also primarily the domain of women, since women usually decide the arrangement of domestic spaces, keep them in good order, and tend the animals and garden that might form part of a household. Furthermore, beyond providing shelter and a space for familial gathering, houses may also accommodate religious, commercial, manufacturing, or agricultural activities that involve the extended family. In some cases, groups of families and individuals live together in multi-family buildings, thus blurring the line between private and public spheres. A review of domestic architecture through time elucidates not only the conditions of daily and family life, but also the broader context of historical, technological, and economic change. The stylistic details of a house reveal cultural alliances and influences, both within the community and in a broader geographical context. At the same time, however, domestic architecture is markedly conservative and resistant to change. Building methods and the arrangement of space both exhibit a tenacious attachment to traditional materials, techniques, and practices, which are primarily dependent on local resources and climatic conditions. Dramatic changes in building practices are invariably the outcome of major economic, political, and demographic restructuring.

Our knowledge of Classical Greek houses is derived primarily from the 1930s excavations of Olynthus, a town in Chalcidice that was founded in 432 BC according to the Hippodamian manner. While the orthogonal street grid resulted in the erection of buildings in blocks of equal size, housing lots varied slightly in size, undoubtedly the result of individual agreements among landowners. The ground space of a typical residential block was roughly a square measuring 17.2 metres per side. Larger houses had five to seven rooms, smaller houses had one or two. All had a small, interior, south-



Architecture (Domestic): view over Mykonos town where the island house type prevails

facing courtyard, where many of the daily activities took place, notably cooking and often weaving. Several of the courtyards also had permanent altars, commonly dedicated to Zeus Herkeios. The houses were constructed of unbaked bricks, on a foundation of rubble. Pillars were mostly wooden, while the sloping roofs were covered with tiles. Water was supplied from the city cisterns or occasionally by a private cistern.

Athenian houses of the 5th and 4th centuries BC bore an affinity with those of Olynthus both in arrangement and in materials. Due to the irregular street pattern of Athens, however, both the houses and the rooms themselves were irregular in size and shape. The rooms of Athenian houses were arranged around a small, usually south-facing courtyard that could be reached either directly from the street, or through a narrow passage. In fact, the courtyard pattern is characteristic of most ancient Greek houses. Some courtyards had a porch supported by columns, on one or more sides. They were later paved with pebbles set in cement, while most floors were made of hard earth topped with clay. The walls of the principal rooms were covered with plaster and painted with a light colour wash. Literary sources frequently refer to the second storey of houses, though none has survived.

Despite the number of passing literary references to the different spaces, and their uses, within the ancient Athenian house, it is still impossible to match these descriptions to archaeological findings. For example, while texts make references to separate men's quarters (*andron* or *andronitis*) and women's quarters (*gynaikonitis*), archaeologists have been unable to identify such specific locations as little evidence exists of the character of individual rooms. This may also indicate a certain versatility of function among the rooms, depending on the season or on the special needs of the household. Another clear social distinction, that between free and slave inhabitants, is also absent from the physical remains of Athenian houses. Presumably, all men slept in the men's quarters and all women in the women's.

Women's work was confined to the house and included the care of children, the cleaning of the house and its contents, the preparation of meals and the processing of food for storage, as well as spinning and weaving to make clothing and bedding. Many professional men also used their house as a place of business. Marble cutting, pottery making, or metalworking often took place in the courtyard. Rooms that opened directly on to the street were used as offices, workshops, retail shops, taverns, or warehouses. Wealthier and poorer housing quarters were not necessarily mutually distinct. Finally, the majority of Greek towns, including, to an extent, Athens, were home to farmers who worked the surrounding countryside. Wealthier city dwellers maintained handsome residences in the countryside as well. These were not only more spacious than most of

the town houses, but also more regular in plan, as the space occupied by town dwellings was restricted by the irregular street pattern.

New socio-economic conditions during the Hellenistic period brought about the creation of a new urban class of merchants, manufacturers, retired soldiers, and civil servants who prospered in the unified Hellenistic world of the Mediterranean basin and who were able to afford larger and luxurious villas. Architects experimented with new building methods and artistic trends, creating impressive domestic complexes. The layout of Hellenistic houses is similar to that of the houses at Olynthus, but larger and more elaborate. The finest surviving examples of the period are found on the island of Delos, a major mercantile centre at the time. Rooms were arranged around an interior courtyard, usually a complete peristyle with elongated Doric columns. The courtyard and the floor of the principal room often featured mosaic decorations. In the Roman period many of the houses also had an atrium, in addition to the peristyle court. As the Greek and Roman cultures infiltrated each other, their domestic worlds also grew more similar.

In the cities of the late Roman empire the apartment house (*insula*) was a more common housing type than the individual dwelling (*domus*). Two *insula*-type buildings have been unearthed in Ephesus. Constructed in the 1st century AD, they underwent several remodellings until the 7th century. There were vaulted shops on the ground floor and modest rectangular rooms on the upper floor, while a two-storey mansion formed a component of one of the *insulae*. Literary sources also confirm the existence of *insulae* in Constantinople. In fact, residents of a five-storey *insula* complained when some of their neighbours kept pigs in the upper storeys. The individual dwelling (*domus*) continued to be based on the central peristyle courtyard surrounded by rooms and other service areas. These included a bath, kitchen, latrines, plumbing and heating systems, and storage rooms.

Building laws regulated the construction of new houses or the remodelling of existing ones (*Codex Justinianus*, 8. 10. 12). A distance of at least 12 Greek feet had to be maintained between houses. Repairs to old houses were allowed, provided the original plan was not altered. New buildings had to respect neighbours' access to daylight and, especially in Constantinople, view of the sea. Balconies could only be built on streets that were over 12 feet wide, and exterior staircases from the street to the balcony were not permitted, as they could obstruct traffic and pose fire hazards.

Byzantine houses built after 1000 were of several building types. A common plan for a private residence, found in Corinth, Athens, Thebes, and Pergamum, consisted of a rectangular building with a central open space without a peristyle. Storerooms for agricultural produce, workshops, and stables were situated on the ground floor, while the living quarters were upstairs. The quality of the construction was usually poor, with rooms small and irregular and houses built on narrow alleys. New buildings were often raised against existing ancient structures, while architectural elements of demolished ancient buildings (*spolia*) were routinely incorporated into new ones. The private mansion of Attaleiates in Constantinople, described in his foundation charter of 1077, consisted of several two-storey buildings connected by a common courtyard. The mansion also included a separate three-storey dwelling with a donkey-driven mill on the ground floor and a family chapel. By the 12th century chapels and churches had become quite common in the residences of the wealthy. Adorned with paintings, marble, and lamps, these private chapels blurred the distinction between domestic and religious architecture. Similarly, the elaborate architecture of the private mansions is reflected in the middle Byzantine churches which shrank to almost domestic proportions.

In the Ottoman period travellers were often unable to distinguish between the houses of Christian and Muslim inhabitants. Stylistic differences in domestic architecture represented social rather than religious or ethnic distinctions. Travelling building groups (*bouloukia* or *tsourma*) were responsible for the most complicated structures, regardless of whether the patron was Greek or Muslim. As they travelled widely, they adapted their building vocabulary to regional practices. Some groups also disseminated the style of the major cities to the rest of the empire. Members of building groups usually came from the same village, and several groups developed secret dialects, which ensured them privacy while carrying out their work. These building groups were usually the architects of the imposing and elaborate mansions (*archontika*), which in turn provided architectural paradigms to local builders.

While, under Ottoman rule, the Greek population generally avoided the exhibition of wealth in order to escape heavy taxation, certain regions flourished as the result of foreign trade: they were notably some of the islands, and on the mainland around centres of local manufacturing. This new urban class was able to display its wealth by building impressive private mansions in Constantinople and Kastoria, in Ambelakia and Kozani, in Makrinistsa and Tyrnavos, and on the islands of Chios and Hydra, Spetsae and Psara, among other urban centres. The designs of these mansions reflect the unique architectural character of each region, and, by extension, the decentralized nature of political, economic, and cultural activity under the Ottomans.

Despite significant regional differences, there were also common characteristics that distinguished island from mainland architecture. The island house was based on a one-storey, single-space nucleus covered with a flat, stone roof. Its dimensions depended on the construction material, essentially the size of the wooden beams. The houses on the island of Santorini, with their barrel-vaulted roofs built in volcanic stone, constitute the notable exception to the general pattern. In some cases we also find two-storey houses, with storage rooms on the ground floor and living quarters upstairs. As in antiquity, most daily activities continued to take place in the courtyard. In the countryside there were also agricultural buildings for shepherds' quarters, the storage of produce, threshing, preparation of wine, and the keeping of animals. In some cases people and animals were housed in the same building (common practice in many parts of the world), the people sleeping on a higher platform. Finally, important influences in the domestic architecture of the islands between the 15th and 19th centuries came from the Venetian urban houses in Crete, the Genoese houses in Chios, and the Italianate mansions of Zakynthos and Corfu. By introducing elements of Classical and Renaissance architecture in the Greek lands, these

mansions prepared the stylistic ground for the subsequent introduction of Neoclassicism in the 19th century.

While island architecture displayed distinct western influences, mainland architecture remained closer to eastern models. The two-storey middle-class house that was common in the Peloponnese, western Roumeli, and northern Greece was built to an elongated plan, with an external wooden or stone staircase leading to the *hayiati*, the covered second-storey interior balcony. Animals were kept on the ground floor, which was also used for storage and sometimes for the loom. Living space was divided into three areas: the *gonia*, with the fireplace where cooking took place and where the inhabitants slept during the winter; a small room over the entrance; and the *sala*, a formal reception area. The *archontika*, rather than being aggregate of humbler farming units, were influenced by the architecture of other urban centres and, possibly, by the local defensive towers that preceded them. As in the islands, wealthy landowners and merchants who travelled abroad often brought back western furnishings, design ideas, and even craftsmen to work on their mansions. The Greek architectural landscape thus continued to reflect the confluence of both local and external political and economic forces. After the War of Independence (1821–32) the construction of the palace, the university, the academy, and other prominent public and private buildings in Athens helped anchor northern European Neoclassicism in Greece. The first Neoclassical houses were built by wealthy residents who had lived in Europe and who often employed foreign architects and builders. Their elements were quickly copied and adapted by local builders who followed the capital's political and cultural lead.

The most dramatic changes in domestic architecture began in the years between World Wars I and II and escalated after the 1960s. In that period Athens and all other major cities were transformed into giant worksites, as each one- and two-storey house was demolished and replaced by a multi-family apartment building (*polykatoikia*). At first glance, the ubiquitous apartment building may signal the modernization of the country, giving Greek cities that elusive "European" image. It is true that a few of these apartment buildings were designed by professional architects who sought innovative ways to cater for the needs of an urbanized nation without sacrificing aesthetic and cultural precepts. The vast majority of them, however, are the work of engineers and developers whose purpose was the purely practical maximizing of buildable area and, therefore, of private profits. While this little-regulated urban building made private ownership (of individual flats) affordable to the majority of the population, it came at considerable public cost. Public spaces, parks, sports facilities, community buildings, and protected nature areas are sorely absent from Greek cities today. Architects and planners are therefore confronted with the formidable tasks of accommodating a growing population, modifying ageing apartment buildings for contemporary needs, providing open spaces in cities, and creating new areas of affordable housing, while remaining sensitive to the inhabitants' needs and to the natural environment.

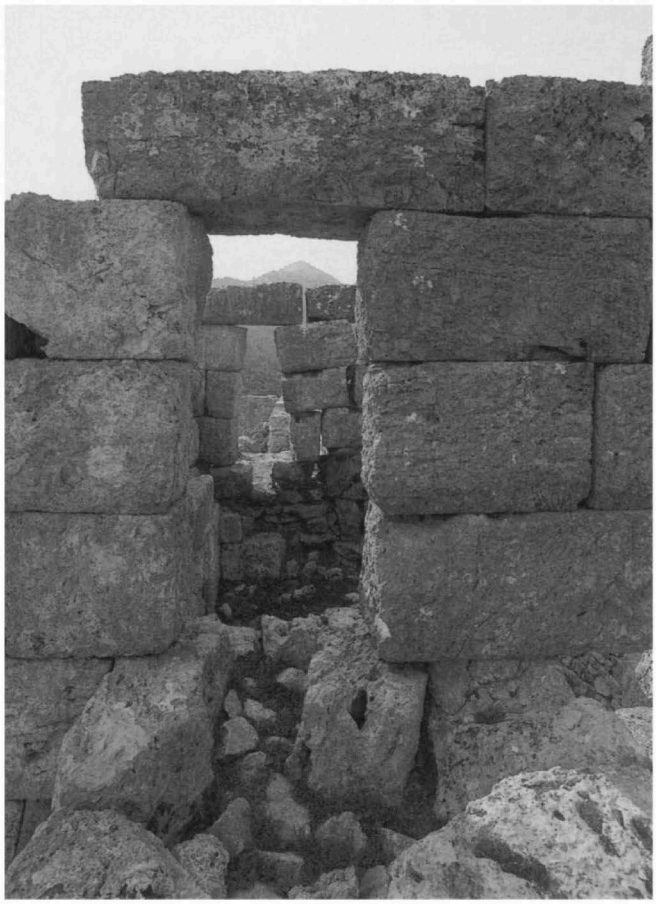
Fortifications

Over the centuries in the Greek world the art of fortification struggled to keep pace with methods of attack; in the long term the attacker prevailed. At times the consequent catastrophes were overwhelming, and the systems being defended collapsed, resulting in a complete regression before the process started again. Therefore no constant line of development and improvement can be traced. In addition, these aspects of warfare did not occur in isolation; external developments, new ideas brought from outside the Greek world, affected the systems employed in Greece.

The Minoan world appears to have eschewed the use of fortifications. There are no walls around the Cretan cities, implying a surprising degree of stability and peacefulness among the various communities on the island. By contrast, the mainland citadels of the Late Bronze Age were fortified, and with the passing of time these fortifications were steadily strengthened. The walls enhance the strength of places already chosen for their steep sides and difficulty of approach. Generally, they are built of massive, irregularly shaped blocks of stone that rely on their sheer weight to keep them in place and the walls intact; this may imply that attack using battering rams was anticipated, and in any case there is no doubt that the massiveness was designed to impress and so deter any would-be attacker. The systems grew up more or less fully fledged, indicating that their origin is to be sought elsewhere – without doubt the even more massive defences of the major Hittite sites, such as Boğazköy in central Anatolia. Gateways were strongly defended, projecting bastions being used to



Architecture (Fortifications): the 4th-century BC fort at Eleutherae, northwest of Athens

provide flanking protection to the actual gate, which, at Mycenae in particular, was given massive jambs and a lintel surmounted by the famous sculptured slab depicting heraldic lions facing a pillar.

Repaired where necessary (and invariably with less massive masonry), these walls served for centuries the communities that emerged from the collapse of Late Bronze Age civilization. New fortifications were rare during the early centuries of the 1st millennium BC. The best example is the walls of Smyrna, in which a high footing of carefully fitted stone surmounted by a thick superstructure of mud brick protected the city from landward attack. This dates from the late 9th or early 8th century BC, and was renewed and replaced until the end of the 7th century BC, when it had to defend the city against an attack by Alyattes, king of Lydia, who brought with him the techniques of siegecraft developed by the Assyrians, particularly overtopping the walls by constructing against them a huge siege mound. Against this the fortifications were helpless, and the same is true a little over a century later, when the Persians used a similar mound against the Cypriot Greek city of Paphos, despite strenuous attempts by the Paphians to undermine the mound by tunnelling.

Within Greece itself this siegecraft was not developed. During the 5th century BC city walls were sufficient to keep out attacks by other Greek forces. In particular, the heavily armoured infantry (hoplites) were too unwieldy, and the risk of losing citizen lives too great. Many cities therefore defended themselves with walls, using stone footings (generally with inner and outer faces only, and a rubble and clay fill) and a superstructure of mud brick. The only practical method of attacking such a wall was to surround it and starve the defenders into submission. This was circumvented by Athens, which linked the city walls with those of its harbour, Piraeus, by means of long walls running the full 7 km between the two places, and then using its command of the sea to import food, protecting the inhabitants from starvation.

Important developments took place in the 4th century BC. Techniques of siegecraft were improved, partly by the introduction of Near Eastern methods, partly by the increased use of specialized non-citizen troops. Siege engines began to be employed, and in consequence the fortification systems had to be strengthened. A crucial development resulted from the victory of the Boeotians over the Spartans in 371 BC. Messenia was liberated, and the Boeotian leader hurriedly created a new strongly defended city at Messene. A huge circuit of more than 6 km was completed within months, allotted section by section to a multitude of constructors. The wall is made throughout of stone, with outer faces of strong rusticated masonry and rubble fill. The most significant development is the addition of towers at regular intervals, to carry missile-throwing engines and archers who could prevent an enemy reaching the curtain wall itself. Gateways were particularly strong; a good example is the Arcadian gate, flanked by towers, an outer gateway giving access only to an inner circular forecourt in which an attacker would be surrounded before being able to reach a second inner gate. Such systems began to be found in other places. In Boeotia itself there is a smaller version at Siphae which is backed by a system of free-standing watchtowers of similar construction.

Some experimentation can be seen in the methods used to build the walls. With the likelihood of direct assault on the fabric of the walls, it was found that a rubble fill might contribute to total collapse if the outer face was dislodged. Different fills, such as packed mud brick, and dividing the interior of the wall into compartments by using through stones binding the inner and outer faces together at intervals, were tried. At the same time, siege engines improved. Philip of Macedon and, especially, Alexander the Great had formidable arsenals of such weapons. Alexander's engines were thwarted only by the walls of Phoenician Tyre, of extra large blocks and gypsum mortar, until he found a weak spot that he could attack by sea. By the end of the 4th century BC systems were extremely sophisticated, but even the walls of Rhodes, strengthened by internal arcaded buttressing, were breached by the elaborate siege engines of Demetrius, and only a desperate defence saved the city. Demetrius' siege engines included a massive mobile tower called the Helepolis, the Taker of Cities, which earned him the nickname of the Besieger; Rhodes was his only failure.

Thus the final phase of Hellenistic Greek fortification had to be designed to keep the siege engines at bay; once they reached the wall, it was virtually doomed to collapse. This was done by providing taller towers that held whole batteries of counter-siege engines, enfilading the wall as well as firing outwards, and by constructing outer systems (*proteichismata*) of secondary walls with deep ditches in front to prevent the heavy and cumbersome engines of the attacker getting close

enough to the walls. Parts of the *proteichisma* of Athens, recently excavated, have in front a sheer-sided ditch 6 m in depth. The strongest and most elaborate of these systems was built late in the 3rd century BC at Syracuse in Sicily, designed by the great scientist Archimedes, but even this failed, after a bloody siege by the Romans.

Despite this, most Hellenistic cities were surrounded by fortification systems so extensive that many of them are well preserved. There are excellent examples at the Greek or Hellenized cities of Asia Minor. Heracleia by Mount Latmos, close to Miletus, is a good example. Miletus itself must have had similar walls, and one of the largest circuits is that at Ephesus. Both Heracleia (a small city) and Ephesus have walls that, like those a century or so earlier at Messene, include a much vaster area than needed for developed habitation, either anticipating expansion or, more likely, leaving room to receive people evacuated from the surrounding countryside in time of war. The walls of Ephesus certainly, and probably also Heracleia, were built for the Successor king Lysimachus, who took over the region after the battle of Ipsus in 301 BC. The walls are of good ashlar, built on the compartment system. Where they run up hillsides, the rock is carefully trimmed in steps to receive the blocks. Towers are generally square, but there are some circular ones, including at Ephesus a massive tower towards the seaward end of the wall. Such walls serve a variety of functions, even if it must have been accepted that they were bound to succumb to a protracted siege vigorously mainrained. They certainly gave routine security against brigandage and small-scale attack, but, most important, they gave their possesors a sense of pride. At some places, such as Perge in Pamphylia, one gets the feeling that the walls, and especially the main gate, were intended as much to look impressive as to be militarily effective.

With the development of Roman authority, military needs changed. The Romans learned their siegecraft from the Hellenistic Greek specialists. The engineers who developed the siege engines worked in a Hellenistic context. Vitruvius, who was Julius Caesar's engineer, certainly knew the engines invented and described in treatises by his Hellenistic predecessors, to whom he refers in his own *De Architectura*. Methods of fortification were vastly improved by the development of concrete construction techniques, which at last made the fill so permanent and durable that any outer facing employed was for decorative purposes only. Moreover, the extension of the empire and the creation of the Pax Romana removed the need for fortifications from the cities of the Greek world. Where walls were retained they were obviously for secondary purposes only, local security, and local pride. The real defence was on the frontiers of the empire.

The incursion of invading peoples into the Aegean area in the 3rd century AD brought a sudden reversal of this situation. Many places were to all intents and purposes undefended. Athens was attacked and sacked by the Heruli in AD 267. A new system of defence was necessary. This had to take account of the fact that a Greek city like Athens no longer had a significant army of its own, or Roman troops to help. It would have to rely on its own limited resources, and this meant that it could no longer hope to defend a circuit as long as that which had surrounded the Classical city, and which, though ruined, survived in part. A new circuit was therefore created, considerably reducing the length of wall and the area defended. This can be seen most clearly in the Agora, most of which was now outside the wall – generally referred to as the "Valerian" wall, after the contemporary emperor at Rome – but this in no way implies that it was an official imperial creation. The wall itself is plainly makeshift. It was made from reused elements of demolished Classical buildings, forming a line of solid but unmortared masonry. At sections, it includes actual buildings; the stoa of Attalus, at the eastern edge of the Agora, survived relatively well preserved because its main structure was incorporated into the new defences. The Agora itself was razed almost completely, not by the Heruli but to create an open zone devoid of cover for an enemy in front of the wall. Beyond this area, the temple of Hephaestus remained intact. The wall ran up to the entrance of the Acropolis. No attempt was made to refortify the Classical Propylaea; instead, a new gate with a small opening and flanking bastions was created, again from reused material, a little below. Everything looks makeshift. It is not constructed according to the latest systems of military works, and, except in so far as it reuses material, it is not a revival of older Classical systems. The city soon redeveloped to include areas outside this wall, but sections of it, particularly on the Acropolis, remained to be incorporated into later medieval fortifications.

Athens in the 3rd century AD is an example of what a Greek city was able to achieve relying entirely on its own resources. Constantine's city of New Rome, Constantinople, represents the opposite extreme, fortified with the full resources of the imperial authorities. The main landward wall, the Theodosian, was laid out in the early part of the 5th century AD. It was built largely of mortared stonework, with regular stringcourses of brick, in the manner that had evolved for Roman concrete construction at the time of the early empire; the obvious comparison is the walls built in the 3rd century AD by Aurelian at Rome. It incorporates larger blocks of stone, for decorative effect rather then necessity, and where a special effect was felt appropriate, there are elements completely faced in good squared masonry; this was particularly so at the Porta Aurea, the great Golden Gate. Such masonry here was a direct revival of the appearance, at least, of the Classical and Hellenistic walls. The wall itself had a regular series of tall towers, placed at intervals of 50 or 60 m. Most were square, some were octagonal, mostly occasionally but near the Golden Gate alternating with the square examples. In front of the wall was a *proteichisma*, lower, but like the main wall, battlemented. It also had towers, but these were not much higher than the wall itself. In front of this was a deep ditch, vertical sided, the sides being supported where necessary by masonry. This was a strong system. Maintained, but not essentially altered in character, it survived as the main defences of the city, and sufficed for resistance to all attacks, perhaps the longest survival of a defensive system, until the Turks set about it with cannon and gunpowder in 1453. Yet, apart from the use of mortar in its construction, it was little modified from the Hellenistic walls of the 3rd and 2nd centuries BC. All the elements in its layout are found in the walls of Hellenistic Athens, and, particularly, in Archimedes' great defences at Syracuse. It is an important example of a continuing military tradition.

Other Byzantine walls may be less spectacular. Many of the cities in the Byzantine empire were already important in the

Hellenistic age. Here the fortifications are often merely the earlier walls repaired and altered as necessary with mortared rubble. Such walls are found on Acrocorinth, for instance, incorporating sections of the gateway of the fortress built by Demetrius the Besieger. Even with the coming of the Turks and gunpowder, such walls were frequently maintained and defended by garrisons as late as the War of Independence.

Military, and Masonry Developments

Military architecture from the ancient world survives in the form of city walls and citadels, and linear walls with towers. The main features of ancient fortification can best be seen in Greek wall building.

City fortification is probably as old as the formation of the city itself. Herodotus tells us that the seven walls of Ecbatana, built in the 9th century BC, were concentric, and towers can be seen on Assyrian reliefs depicting military sieges. A well-preserved early example of city walling is at the Hittite capital of Hattusas, Boğazköy in Asia Minor. It has an earth glacis or berm lined with stone at the base of the wall. On the top was either wooden palisading or mud-brick walling. The warring Greek city states improved on these examples, adding their own innovations.

The Lion Gate at Hattusas has a straight principal entry, like the Lion Gate at Mycenae, and both these gates were strengthened spiritually by the presence of the religious sculptural decoration. The idea of a spiritual aid to defence continues into the Byzantine period, when gates were dedicated to Christ or the Mother of God or to a saint. The gates or guardian towers often had a chapel incorporated in them, usually on the first floor.

The Lion Gate at Mycenae testifies to the importance attached to the defence of city gates. It was placed at an angle in the walls so that attackers approaching the gate on the road beneath were subject to flanking fire before they actually reached it and, in addition, it has a defensive bastion on the opposite side to the city wall. The obvious importance of the gate to any fortification is echoed by literary tradition which describes how each of the seven leaders in the Theban war was in command of the attack on one of the seven gates of the city, and that six of them were killed. At Troy a legend has it that Achilles was wounded by an arrow in the heel while attacking the Scaean Gate, which suggests defensive fire from a flanking bastion. By the 4th century BC the more developed form of a gate flanked by two defending towers can be seen at Messene. This type became the standard defence to the principal gate of many cities in the Greek, Roman, and Byzantine periods, since such towers offset the weakness of the gate itself. At the same time they provided protection for an orderly sortie of counter-attacking cavalry or infantry. In times of peace, such a gate was also used for important fêtes and processional purposes. Two other forms of gateway appear in Greece from the 5th century onwards. The bent gate forces an enemy to turn a corner between heavily defended walls before he reaches the gate. A development of the bent gate in Byzantine and crusader times provided for a second or even a third bend inside the principal gate so that, if the besiegers broke it down, they still lacked clear access to the town or citadel that they were attacking. The postern gate served the defenders as a secretive means of communication with the outside world and as a means for covert counter-attack. A postern gate appears at Hattusas, Boğazköy, and was not an invention of the Greeks, but it became a regular element in Greek, Roman, Byzantine, and Frankish fortification.

Walls and towers antedate ancient Greece, but from the Bronze Age onwards the Greeks made great developments in wall construction. Early Cyclopean masonry can be seen at Tiryns and Mycenae. It is typified by the use of huge blocks of irregular masonry shored up by smaller stones and backed by earth and rubble. From the 5th century BC onwards there was a rapid development of masonry types. For their strength these mainly rely on the masonry surfaces of the wall, which were backed up by a core of earth and rubble and could absorb the shock of a missile or the impact of a ram. The surface blocks were made of regular ashlars fitted closely together. The setting pattern for these blocks developed in the Classical period. Instead of regular blocks laid in horizontal courses with the long side outwards, a pattern of headers and stretchers was developed that greatly strengthened the wall. The headers went deep into the earth and rubble core and gave much greater stability. This type of walling, known as casemate walling, probably derives from timber bonding, which was used in mud and masonry walls from the time of the Old Testament onwards (1 Kings 6: 36). A second development was the use of embossed masonry, which can be seen in the 4th-century BC fortifications of Aegosthena and Messene. Whereas ashlar blocks had a smooth surface, the embossed block had smooth margins at the edges while the rest of the surface was rough hewn and irregular. It was designed to dull or deflect the impact of missiles. Its efficacy is reflected in its long history that ends only with the decorative use of it as rusticated masonry in the Baroque period in western Europe.

The early historical development of masonry that makes use of lime mortar as opposed to earth has yet to be charted. It is of vital importance not only to military building but to all architecture since lime mortar transformed the wall into a single strong structural component; earlier, it had consisted of the two elements of fitted surface blocks with an interior core of earth and rubble filler. Vitruvius names an early type of lime mortared walling – *opus incertum*. He remarks that this walling is much stronger than *opus reticulatum* and attributes it to the Greeks, and says that it is not to be made light of. Philo of Byzantium, writing in the 2nd century BC, refers to mortars and to the use of *gypsos*, which may be gypsum rather than lime. However that may be, his lack of emphasis on the use of lime suggests that he did not fully understand its poten-

tial. It was the Roman military engineers and builders who made the greatest advances in the use of lime mortars and lime concrete, and their technical advances were in turn made use of by the Greeks in the Byzantine period. The massive Slav invasions of Greece from the 5th century onwards and the Persian invasions of Asia Minor in the 5th and 6th centuries AD followed by the Arab invasions in the 7th to 9th centuries, saw the transformation, and often the virtual destruction, of the great Greek and Roman cities of the plains. There was a need for rapidly built and efficient defensive walling, and the type of masonry favoured by Byzantine military engineers was the Vitruvian *opus incertum* or mortared rubble wall, with a bonding system of either brick or timber. This could be constructed under the supervision of a military engineer with the use of unskilled labour, most probably the soldiers themselves with the help of forced levies of the local population to bring in stones. It did not require a large force of skilled masons to perform the slow task of shaping ashlars for the smooth surface of a wall. Nor did it require stone suitable for cutting and shaping, since any shape or size of stone could be firmly bedded into the wall mortar with its smoothest face to the outer surface. The outer surface of the wall was protected from water penetration by a shelter coat of lime plaster. In the Byzantine period from the 6th to the 15th century there are numerous examples of *opus incertum* military walling scattered throughout Greece, the Balkans, and Asia Minor. Unlike ashlar walling, *opus incertum* does not look elegant or impressive, and it is difficult to date unless it incorporates inscriptions, brick bonding courses, or decorative features. It has not attracted much attention from Classical scholars because it is not aesthetically pleasing, but its legacy was of fundamental importance not only in military architecture but in all workaday building in the medieval and modern world until Portland cement replaced lime mortar.

The two main categories of military architecture lie in the defence of cities and the defence of frontiers. In the siting and defence of cities the Greeks carried on an ancient tradition of using naturally defended sites: either around a hilltop as at Mycenae, or in the case of ports by using natural ravines. Such natural defences could be improved by rock clearance or ditching. The Greeks concentrated on the development of hilltop citadels such as Aegosthena or Acrocorinth to serve as a final stronghold if the walls of the city were to fall. A Greek city in the plains such as Mantinea was an exception that only became the rule after the Roman conquest; it was not until the 3rd century AD, with the Gothic invasions, that there was an enemy of consequence. In the Byzantine period cities often reverted to Hellenistic hilltop sites and it is not uncommon to find a city with the original Greek ashlar masonry at the base of the wall and Byzantine mortared rubble masonry in the higher courses.

Linear fortifications were used at Athens to link the city with its port and at Acrocorinth to link city and citadel, but they were more suited to frontiers or to the creation of walled mountain refuges that sheltered the whole population of an area with its livestock. Thus the walls of Messene enclose not just a city but a whole landscape. During the Peloponnesian War a defensive wall across the base of the peninsula was planned. Another example is the Byzantine long wall of Thrace.

In both city walls and linear fortifications towers were a regular feature. But once again it was the Greeks of the ancient world who seem to have made the most significant developments in the construction of towers. Early towers seem to have been an integral part of wall construction. They were conceived as vantage points, higher than the adjoining wall, and by projecting a little they acted as buttresses from which flanking fire could be directed upon the attackers. By 304 BC towers that were structurally independent of the walls had been developed. At Rhodes Demetrius Poliorcetes destroyed the curtain wall to either side of a tower, but he was unable to take the tower itself. The text of Philo of Byzantium on the subject of towers is ambiguous, but he does appear to suggest that some towers were structurally independent of the walls, and that they were heightened by the addition of a smaller turret on the top level. The archaeological evidence for the upper work of towers is lacking since none survives intact, but in the 6th century AD Procopius describes independent tower keeps that were forerunners of the medieval keep. No Byzantine examples survive, but their existence is suggested by 16th-century Ottoman examples, such as the White Tower at Thessalonica, and the three great towers of Rumeli Hisar outside Constantinople. In the individual forms of towers and in the traces of walls the ancient Greeks were also innovators. They built towers that were rectangular, round, and U-shaped. Philo of Byzantium seems to recommend the pentagonal, prow-shaped tower. Its pointed shape served well to deflect missiles, and it was a favourite choice in Byzantine fortifications. A version even survived to form a part of artillery fortifications from the 16th century onwards. Philo of Byzantium also describes a wall traced on the pattern of saw teeth. A good example is the 9th-century walls of the Byzantine city of Ankara.

The modern visitor to Greece will be struck by the many medieval castles that are labelled Frankish. Mistra is one example, said to have been built by Villehardouin. The fact that there is a Byzantine chapel in the citadel and that the wall construction is basically Byzantine suggests that Mistra and many other Greek medieval sites were of Byzantine construction but occupied and repaired by the Franks. Another prominent feature of the Greek landscape is the massive artillery fortifications built by the Venetians and the Turks in the 17th and 18th centuries. These fall outside the Hellenic tradition; they owe their radically new design to Italian military engineers, although the continuity of Hellenistic design may be detected in the modified shape of the prow tower.

The surviving evidence of military architecture thus shows that the ancient Greeks and the Byzantines were important developers in this field, and sometimes skilled innovators.

Palaces

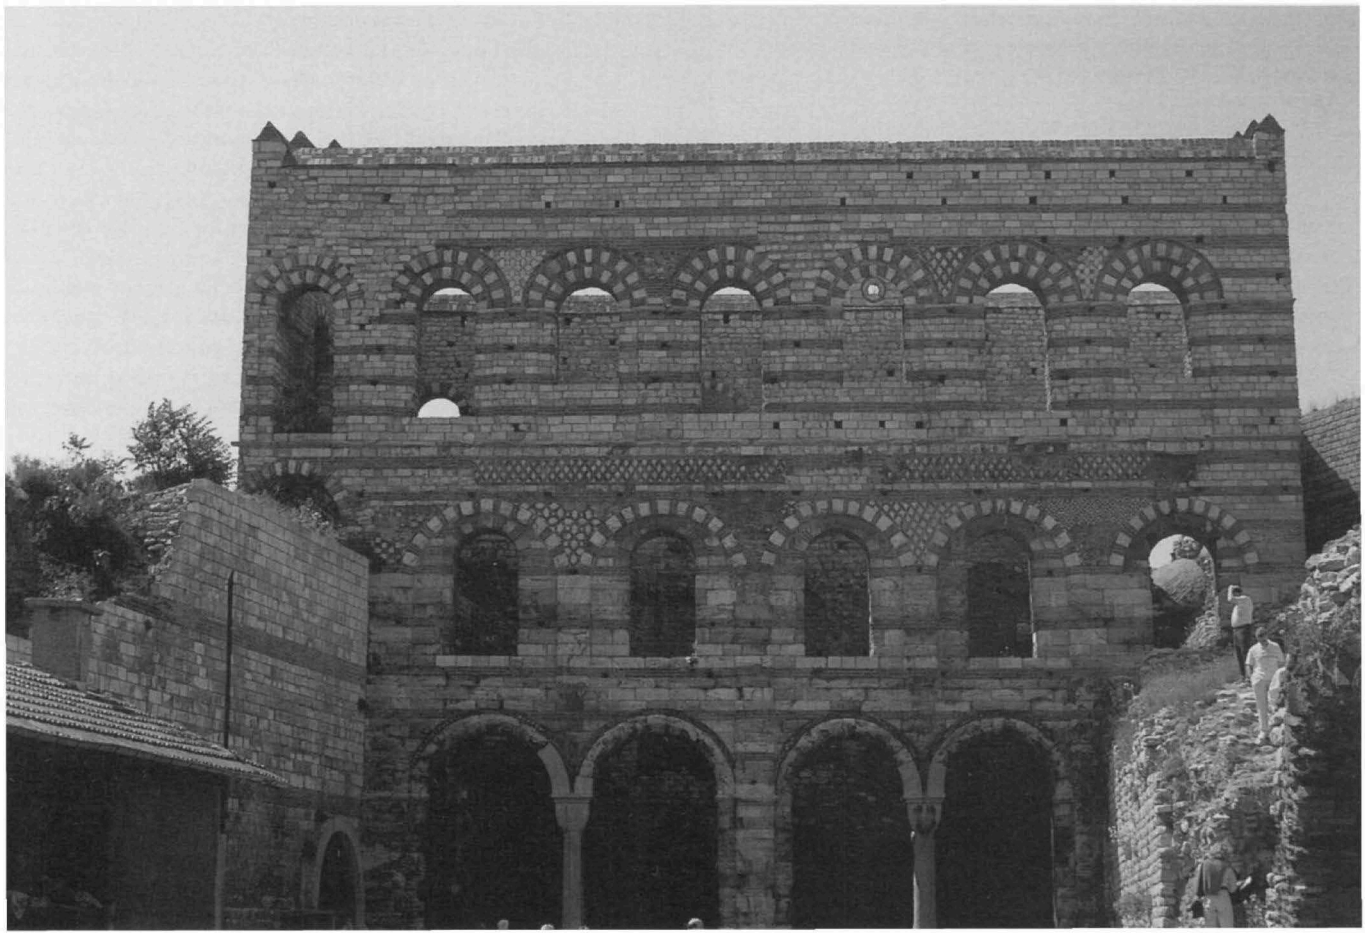
If palaces are defined as buildings that served as a residence and place for fulfilling the administrative duties of a ruler, it is obvious that they will not form a significant element in the architecture of Classical Greece, since at that time monarchy was not a normal political system. At other periods, before and after, the picture is different. The prehistoric societies of Greece, in their developed forms, depended on a complex, centralized administration which, presumably, was under the supreme control of individuals, though, apart from the palaces themselves, the only evidence for this is in later legend, with all the dangers of distortion that implies. There are two main types of palace found in the Bronze Age communities of Greece, the Cretan (Minoan, in the archaeological terminology invented by Sir Arthur Evans, who excavated the greatest of them, at Knossos) and the mainland (Mycenaean). Since we have no written record of how these presumably monarchical states functioned, other than references to authority in the Linear B tablets, interpretation of their palace architecture has to be based on the buildings themselves.

The palace at Knossos comprises areas that can be assigned with some certainty to residential purposes and others that functioned as storerooms, workshops, record office, and thus administrative functions; and others, less easily understood, that were probably designed to accommodate some, at least, of the religious functions of a monarch. The structure developed over a protracted period of time, punctuated by natural disruptions, particularly earthquake, before final destruction some time in the 14th century BC. The placing of the various elements round a central courtyard (a regular feature of the Minoan palaces) gives a superficial appearance of unity; in fact, it is clear from the archaeological evidence that the palace was rather the result of piecemeal development. There is no simple unity to the plan: the different sections have their own organization, and, generally, their own separate routes of access, a feature that is normal in Minoan architecture. The residential areas are on the eastern side of the courtyard. They presented two storeys to the court, though there were also basements taking advantage of the slope down from the courtyard and overlooking a river valley. Grand, wide staircases surrounding a light well led up and down. The individual rooms are spacious and well decorated. (Evans's attempt to assign occupiers to some of them, such as the "Queen's Megaron", are entirely fanciful.) A distinctive feature is the division of a room from a shaft by means of a set of folding doors set between piers. This must have been designed to control and modify the ventilation, to allow free circulation of air during the hot summers, to restrict it in the cooler winters. The religious function seems to have been served by at least one room on the opposite, western side of the court, one of the oldest parts of the palace: a lavishly decorated room, containing a solitary stone "throne", and with basins sunk in the floor, for water and possibly some purification ritual. The courtyard itself, it is suggested, may have been the location for the bull-jumping ritual depicted in Minoan art. The storage and workshop areas comprise long passages, with magazines and other rooms leading off. They are much vaster than would be required to meet the consumption of the residents in the palace: the materials stored and produced would be intended for trade, in a system of economy that would be managed and controlled by the centralized palace authority.

The Mycenaean palaces developed later, after the apparent collapse of Minoan Crete, and were obviously influenced by their Minoan predecessors, whose centralized political and economic systems they probably imitated. There is, however, a significant architectural difference. The central element is a rectangular hall building, divided into an open porch, with two columns, and a square room, sometimes separated from the porch by an antechamber. This was the formal area of the palace. It contained a large central hearth, too big and too magnificent to be merely for heating, and which presumably had some ritual significance. The room may have functioned as an audience chamber, or perhaps the place where the monarch consulted some form of council. It is generally assumed that it corresponds to the room where the kings of the Homeric poems carried out such functions, and the term given to it by Homer, the megaron, is normally applied to its Mycenaean predecessor. In addition, there were often subordinate rooms of similar plan, and, as on Crete, archive and storerooms for a similarly centralized administrative and economic system.

After the collapse of these complex systems, the divided Greek communities may still have been ruled by individuals; a monarchical system, dualized, survived at Sparta throughout its independence, and there were kings even in the Classical period in more backward areas, such as Epirus and Macedon. The houses of these kings may have been somewhat bigger than ordinary dwellings, or placed in particularly prominent locations – a good example is that at Emporio on Chios – but they were of no architectural pretensions, and it would be misleading to call them palaces. Under the non-monarchical regimes of the classical cities, such buildings would only exist under tyrant administrations, but there is no archaeological evidence for the form these took (the palace at Vouni in Cyprus of the 5th-century BC seems to be non-Greek in origin).

Palace architecture becomes important again with the rise of Macedon. Traditionally the Macedonian kings resided at Aegae, but the palace found there in the 19th century dates only from the end of the 4th century BC. Before then, at the end of the 5th century BC, king Archelaus transferred his administrative centre to Pella and built a palace there. This remained the palace of Philip II, and it was there that Alexander the Great was born. It was situated at the top of an acropolis hill, overlooking the city. It is currently being excavated by the Greek Archaeological Service, but it had been very thoroughly destroyed at the end of Macedonian independence and little more than its foundations survive. Its principal feature is that



Architecture (Palaces): the so-called Palace of Porphyrogennetos, now known as the Tekfur Saray, built in Constantinople in the 13th century

it incorporates five distinct courtyards, not all built at the same time, and certainly separating official from residential areas. The residential section probably dates back to the 4th century BC. We know that important artists, such as the painter Apelles, were recruited by Archelaus to decorate and embellish it, but, inevitably, nothing of this survives.

The palace at Aegae, probably built by the successor king Cassander, who wanted to revert to the older Macedonian tradition, is better preserved. It consists of two parts, a smaller courtyard structure at the back, added at a later date, and a large formal courtyard in front, overlooking the plain of the Haliacmon river. This measures 44.50 m square, and was surrounded by Doric columns, 16 on each side and made of local limestone. The entrance is at the centre of the east side, into which it is incorporated. It is marked by two marble piers, each fronted with engaged Ionic half columns, and gives a degree of formality and axiality that is not found in ordinary Greek houses. To the left of the entrance, and entered from the court, is a circular room containing a throne, probably religious in function, dedicated to Heracles Patroos. As far as can be seen from the remains (not all are well preserved), the other rooms that surround the court were all designed for formal feasting. Those on the south side were particularly splendid, two being entered from a vestibule with marble half columns recalling those of the porch. Their floors had magnificent mosaic decoration. Those on the west had space on the surrounding plinths for 30 dining couches. Despite their dimensions, 16.74 by 17.66 m, they were roofed and tiled, with the largest unsupported spans known in Greek architecture, an indication of the superior quality of Macedonian timberwork. The graduation of size and splendour (the floors of the largest rooms were paved with broken fragments of marble only) suggests the hierarchy of the Macedonian court. The whole concept, which was probably anticipated at Pella, was influenced by the Macedonian tradition of erecting large (100-couch) temporary dining pavilions or tents in sanctuaries for particular religious occasions. Such a pavilion was taken by Alexander on his campaign of conquest.

These Macedonian palaces must have influenced the palaces of the successor kings who established themselves in the different fragments of Alexander's empire, though little archaeological evidence survives for them. At the same time the Persian royal tradition was also influential. At Pergamum, which became the capital of an independent kingdom in the second half of the 3rd century BC, there survives on the top of the hill on which the city was built a group of houses that would have served the royal family. They have good-quality mosaic floors, but apart from their select position have nothing special about them to distinguish them from the better-quality Hellenistic houses.

More important was the palace of the Ptolemies at Alexandria. There are no surviving archaeological traces of

this, though evidence for its position has been confirmed by recent underwater research in the adjoining harbour area. Literary evidence gives us some idea of its arrangement and what it comprised. The city had been founded by Alexander as a place in which he could gather the existing Greek settlers in Egypt. He may have intended a palace, though whether he would have regarded it in any sense as his capital in Egypt is unclear. Rather, the palace was developed by his successor Ptolemy I Soter (305–282 BC) and his descendants. An area by the sea and in the northeast part of the city was designated as the royal area (Basileia). It had two main parts. The outer, which was accessible to the public, contained sanctuaries and buildings such as the Museum with its great library, and the theatre. It seems to have been an open space of parkland – it included a zoo – within the city, with the buildings spread out. There was still room in the 1st century BC for Cleopatra to build a shrine-sanctuary dedicated to her lover, Julius Caesar. The inner area, on the promontory Lochias that formed the eastern side of the Grand Harbour, was occupied by the private quarters of the royal family. Even here there seems to have been open space, and the building of which we have the fullest description was a typical Macedonian dining pavilion with 100 couches, lavishly decorated and carpeted. It was built by Ptolemy II Philadelphus (282–246 BC); we have no idea if it was anything more than a temporary structure, though the description we have, by the late author Athenaeus (*fl.* AD 200), derives from the near-contemporary Callixinus, and refers to a structure then long since disappeared.

Much more remote, and part of a very different tradition, was the palace at a Greek settlement known only by its modern name of Ai Khanum in Afghanistan. Here a large area to the west of the main road through the city was devoted to the palace. It dates from the foundation of the place in the early 3rd century BC, with a final phase of about 150 BC. It was vast, covering an area of 87,500 sq m. It was entered by way of a monumental propylaea building, and then a second propylon after the road turned through 90 degrees. This led to a large courtyard surrounded with Corinthian columns, at the back of which was an oriental-type open audience hall, with a wide room behind. Behind all this was the residential area. There are distinct Mesopotamian elements in this, though it undoubtedly belonged to a Greek ruler.

The word "palace" is itself derived from the name of the Palatine Hill in Rome, where the emperors lived. At first their residences were almost entirely in the non-Hellenic tradition of the Roman atrium house. The intention was to play down the concept of monarchy, now equated with the Hellenistic rulers, but as the imperial system came more and more to incorporate elements of the Hellenistic monarchies over whose territories it now ruled, aspects of Hellenistic palace architecture were adopted by the Romans, for example in Nero's Golden House and Domitian's palace on the Palatine.

As a result, later palaces in the Greek area echo rather the Roman type; this can be seen in the palace of Galerius at Thessalonica with its adjacent hippodrome. The same is true of the Great Palace at Constantinople, though this has suffered badly in successive destruction and rebuilding. As with the earlier imperial palaces it comprised an official, administrative area to the east, and a residential one to the west. The entrance to the official section was at the gate called Chalke, south of Hagia Sophia. Within were audience chambers, quarters for the imperial bodyguard, a church, and a 19-couch dining hall. Terraces faced southeast, overlooking the sea, while to the northwest was the Hippodrome, corresponding in its relationship to the palace with the Circus Maximus in Rome. Little of all this remains visible, though the monuments decorating the central line of the racecourse, including the serpent column taken from Delphi, survive. Written descriptions of the sumptuous decoration within give a general idea of its magnificence; excavation has revealed mosaic floors of the highest quality.

In form, this was in complete contrast to a much later building, probably of the 13th century AD, long after the Great Palace had been abandoned. This is the so-called Palace of Porphyrogennetos (Tekfur Saray), which seems much more Western in style except for the decoration of the façade. It comprises a simple rectangular plan with three floors, the first supported on vaults, the second on wooden beams. The ground floor is entered through open arcading, and there are rows of arched windows for the upper floors. Very similar, and of the same approximate date, is the palace of the Despots at Mistra. This too includes a rectangular hall on three floors, together with a more confused wing at right angles. It is now in the process of extensive restoration.

The next Greek palace follows the liberation of Greece from the Turks, and was built for the first king, Otho of Bavaria, between 1837 and 1841, to the designs of Friedrich von Gartner, when it was by far the largest building in the still small city of Athens. It is rather plain, but has good Classical detail to the windows, and a porch of ten Doric columns, as though to emphasize that it is a Greek building rather than a German *Residenz*. It now serves as the Boule, the parliament building.

Public Works

While domestic architecture provides shelter to individuals and families, public architecture exists primarily for the benefit of the health, safety, and wellbeing of the larger community. Public architecture caters, among other things, for the provi-

Architecture (Public): the ancient theatre at Palmyra, dating from the 2nd or 3rd century AD

sion of water, removal of waste, facilities for personal hygiene, street paving and other civic utilities, and defensive works. Public architecture, in the form of harbours and lighthouses, roads and bridges, markets, and, more recently, railways and telecommunication systems, also facilitates and encourages commerce and other exchange. Finally, public works, such as poorhouses and hospitals, schools and orphanages, police headquarters and prisons, are associated with social welfare and public order. Depending on the historical period and on the particular administration, responsibility for the undertaking and maintenance of these projects rested variously on private individuals, the city state, the Church, the local or central administration, and national or international commercial concerns. A review of representative public works provides an insight into the daily life of an average citizen, with its attendant inconveniences and occasional luxuries, and reveals the major preoccupations and priorities of various administrations.

In the cities of Classical, 5th-century BC Greece civic buildings and public works were commissioned and financed by the citizens themselves. They included roads and fortifications, temples and theatres, stoas and gymnasia, water fountains and reservoirs. In the pre-Classical period these were financed by kings and tyrants, while in the subsequent Hellenistic and Roman eras they were often commissioned by wealthy donors and, in some cases, by the emperors themselves. Provision of water and removal of waste formed the core of most public works projects.

Although there were elaborate bathing facilities in the palaces of Crete and Mycenae, and simpler ceramic bathtubs (similar in shape to our own) in Olynthus, most people in antiquity bathed in public baths. These had separate spaces for men and women and were often located at the entrance of cities for the convenience of travellers. Public baths gained widespread popularity in Roman times, becoming large and impressive social spaces that were adorned with marble, mosaics, and statues. Public latrines, built also by the city states, similarly provided for the needs of both travellers and residents, since most houses did not have private latrines. In the Roman Agora of Athens an elegant public latrine building accommodated up to 64 customers in a generous, roughly square room. Lavatory seats, carved out of marble, were arranged around the walls. Running water continuously flushed the latrines, while an opening in the centre of the roof allowed for ventilation.

Drinking water for people and animals was supplied by wells, fountains, aqueducts, and reservoirs. In the 6th century BC the tyrant Pisistratus erected the Enneakrounos (nine-

spouted) fountain in the Agora of Athens on the site of the simple spring called Kallirrhoe (fair-flowing). It became famous both for its architectural elegance and for its cool water, which was used in wedding ceremonies for the bathing of the bride. Several other fountains and wells in the Agora and the rest of the city provided water for residents and travellers, their animals and plants. In the Agora of Athens alone 400 wells were opened up throughout a 1000-year period, as indicated by pottery shards found in excavations. In Athens the supervisors of the fountains – *epimeletes krenon*, as Aristotle called them – were elected by the citizens to serve four-year terms, while less important municipal posts were assigned by lot. Care and maintenance of the water supply have always remained an upmost priority for each administration, as it directly affects the life and health of the whole population.

In the islands and other places with little rainfall, residents built private cisterns in their courtyards and occasionally public ones, like the large cistern on the island of Delos (measuring 15.5 × 6.3 m) that gathered rainwater falling in the theatre. A famous water reservoir, built in the island of Samos during the rule of tyrant Polycrates in the 6th century BC, remained in use for 1000 years. According to Herodotus, it was the work of the architect Eupalinus from Megara.

The swelling population of cities and the widespread institution of public baths increased the demand for additional water. New aqueducts transported water from the nearby mountains to central reservoirs in the cities. From there, a network of clay pipes directed the water to baths and fountains. The most elaborate fountains, called nymphaia, were monumental in size and shape, embellished with the statue of the emperor or donor and with numerous sculptures of water nymphs, satyrs, and river gods. Among the most celebrated fountain buildings in the Greek world were the nymphaeum of Herodes Atticus in Olympia and the three-storey nymphaeum of Miletus, both dating from the 2nd century AD. The Roman emperor Hadrian, who embellished Athens with several new structures, also addressed its water supply. He built an aqueduct system that collected water from the nearby mountains of Parnes and Penteli and brought it to a great reservoir in Athens, on the southeast slope of Lycabettus. The reservoir, which can still be seen today, was cleaned up and used again in 1857 and in 1925–26. Waste water along with the rainwater of the Athenian Agora was collected in a closed conduit that led to the Eridanos river. The sewer, which survives almost intact, is still in use today.

In Archaic and Classical cities roads were usually narrow and meandering. One of the most famous roads of antiquity was the Sacred Way that started from the Sacred Gate of Athens and ended 20 km away at the temple of Demeter in Eleusis. The road was 5 m wide, defined on either side by two courses of rough stones and paved with small stones and packed earth. The road was punctuated by stone markers denoting the distance from Athens. Unlike their predecessors, Hellenistic cities were laid out with generous and regular streets. Alexandria, in Egypt, featured an orthogonal street pattern with seven parallel avenues, the central one of which was 31 m wide. Each avenue was bisected by a tree-planted island 1 m wide. One side was paved and intended for people on horses, while the other side was covered with packed earth and pebbles for carriages and chariots.

The construction of harbours was also an important undertaking in ancient Greece, since most of the commercial and military activities relied on sea routes. Harbour entrances were usually wide enough for only one ship to pass through and could be closed with a chain in case of danger. Dock buildings (*neosoikoi*) housed the boats during the winter, while the boats' movable parts – sails, anchors, ropes, chains, etc. – were stored in separate buildings called tool chests (*skeuothekai*). *Neosoikoi* could be found in the Piraeus, Sunium, and other towns by the sea, while the most famous *skeuotheke*, that of Philon in Piraeus, took its name from the architect who designed it.

The Pharos of Alexandria, one of the seven wonders of the ancient world, was the most famous lighthouse in antiquity. It was built on a little island called Pharos for Ptolemy II of Egypt *c.*280 BC. It is said to have been more than 110 m high, with a light that could be seen from a distance of about 300 stadia (about 55 km) at night, while its smoke could be seen from even further away in the daytime. A broad spiral interior ramp allowed the mules to carry wood for the fire that burned at the top. The outside of the lighthouse was made of white stone and decorated with marble and bronze designs. An inscription recorded the name of the architect, who was also known for other works he completed: "Sostratos, the son of Dexiphanos, dedicates this to the gods, saviours of those who travel." Continuously repaired, the Pharos was still standing in the 12th century.

Defensive walls were often one of the most costly public works of a town. They usually enclosed all of a city's area and were expanded as a city grew. Athens, for instance, built first the Mycenaean walls (1240–1220 BC) and the Pelasgic walls, followed by the Themistoclean (479/78 BC) and the post-Herulian walls of the 3rd century AD. Ruined parts of earlier buildings including stones, unbaked bricks, and tiles were commonly incorporated into the walls, which were often built in haste. In case of danger, they provided refuge not only for a town's residents, but also for the inhabitants of the surrounding countryside.

The extensive public works established by the Romans continued to be used and maintained by the Byzantine emperors and administrators. Constantinople drew its main water supply from about 15 km northwest of the city, through an aqueduct built by Hadrian and later restored by Valens. The masonry arches which carried it a distance of 970 m still stand today. A new network of aqueducts was constructed in the late 4th century to accommodate the needs of the growing population. Additional water was supplied by large cisterns, which became the main source of water after the aqueducts fell into disuse around the 7th century. Cisterns supplied water to public baths, monasteries, and churches. The city of Constantinople, whose daily water consumption was about 10,000 cubic m, had a number of open cisterns, with approximate capacity of 900,000 cubic m, and more than 80 covered cisterns, with a capacity of 160,000 cu m. Most houses in the cities and the countryside had no plumbing. Even three-storey houses in Constantinople were often built without sewer drains. Residents obtained water from cisterns and wells and used latrines located outside the main buildings. The large public Roman latrines remained in use until about the 7th century, but apparently not beyond. Building codes regulated

the construction of new latrines and other plumbing installations, such as gutters, sewers, and water pipes.

Public baths continued to play an important social role in the late Roman and early Byzantine periods. There were as many as nine public and 153 private baths in 5th-century Constantinople, with elaborately decorated interiors, featuring statues and other marble decorations. Although clergy and monks also used public baths, the Church regarded baths as centres of immorality, prohibiting mixed bathing and condemning frequent visits there by the clergy. Population decline, coupled with their high maintenance cost and the Church's disapproval, caused the gradual abandonment of public baths after the 6th century. While few remained in use in the subsequent centuries, most buildings were converted to other uses. By the 11th and 12th centuries monastic guidelines prescribed bathing from twice a month to three times a year, with the norm being once a month. The Church promoted the healing nature of bathing and allowed patients in monastic hospitals frequent or even unlimited baths. Monastic baths continued to be built throughout the Byzantine era.

The Byzantine state supported a host of public welfare institutions that tended to the sick, the poor, and the orphans: the hospital (*xenon* or *nosokomeion*), the hospice (*xenodocheion*), the old-age home (*gerokomeion*), the poorhouse (*ptochotropheion*), the orphanage, and the ecclesiastical welfare centre (*diakonia*). Byzantine philanthropy had, of course, antecedents in the pre-Christian era. What made its character unique, however, was the emphasis on spiritual salvation both for the giver and for the beneficiary and the designation of all philanthropic institutions as ecclesiastical units. Although the Church played a prominent role in public charity, some of the welfare institutions were lay sponsored, while others were directly dependent on the emperor. After the 10th century all new charitable institutions were affiliated to monastic communities.

The Ottoman empire perpetuated the tradition of public welfare with the establishment of the *waqf*, a philanthropic, income-producing foundation that expended this income on charitable purposes. *Awqaf* supported mosques, colleges, hospices, fountains, bridges, dervish convents, etc. They generated income for the support of these institutions by building and managing stable establishments that secured a steady rent: Turkish baths, bazaars, shops, bakeries, oil presses, mills, slaughterhouses, tanneries, etc. While in principle *awqaf* were established to support charitable institutions pleasing to God, in practice they also benefited individuals and contributed to the economic life of cities. The few Ottoman structures that still survive in Greece today – baths, covered markets, inns, bridges, fountains – bespeak of an extensive and well-organized network of public works for the cities and the countryside that built upon the legacies of Rome and Byzantium.

After the War of Independence (1821–32) feverish building activity signalled the new state's extensive reconstruction efforts. Initiated by prime minister Charilaos Trikoupis, public works projects between 1882 and 1895 included the construction of a 2640 km road network, 894 km of railway lines, and 6,500 km of telegraph lines. Of the extensive works carried out in harbours, bridges, and lighthouses, two clearly stand out: the draining of Lake Copais, begun in 1882 by a French company, and the opening of the Corinth Canal in 1893, an 11-year project directed by a Hungarian engineer. The belief that technological and economic progress would help Greece gain entry into the family of western Europe began to shift the country's focus from the Classical culture of antiquity to the technological culture of the present and the future. Recent efforts have improved the transport infrastructure – harbours, highways, railways, and airports – in order to encourage both the import–export market and the growing demands of the travel industry. Finally, public works have also focused on environmental projects that include the treatment of waste water dumped in the sea, reforestation and fire protection, pollution control and recycling. Greece has to balance the often competing demands of a growing economy and raised standard of living with their attendant impact on the environment and the ecosystem.

Religious

In the prehistoric period the practices of religion were partly associated with the palaces, in which rooms or areas were set aside for cult purposes. In addition, there were shrines at localities that had some particular religious significance; on mountain peaks, for instance, in Minoan Crete, or in caves. There is an obvious shrine building below the citadel at Mycenae, but its religious character is attested by its contents – terracotta cult figures and frescos – rather than the architecture, which is nondescript.

Classical religious architecture begins with the revival of the Greek world following the collapse of the Bronze Age communities and its aftermath. There is undoubtedly some continuity of religious belief, though the movements of peoples may bring different cults with them, and there may have been some association of religious practice or beliefs with the ruins of abandoned structures surviving the collapse, but by and large religion was at first devoid of monumental structures, and cults might well be performed at nothing more than an open-air altar. Yet the gods were identified as persons, and inevitably could be represented, whether or not realistically, by images. References in late literary sources (especially Pausanias) to wooden cult images of great antiquity, similar to the one that survived at Athens, suggest that these were frequent, and needed to be protected from the weather. There are a number of early, simple, square buildings at Kommos, in Crete, of the early 1st millennium BC, which probably housed such images.

Architecture (Religious): Temple of Athena Nike, on the Acropolis at Athens, dating from 427–424 BC

From these simple origins there developed a regular system for the architectural requirements of Greek religion. The central act was the sacrifice, performed at an altar. Some altars were non-architectural (the altar of Zeus at Olympia was no more than a pile of ash), but normally they were built of stone, rectangular in shape, and decorated with the conventional architectural mouldings or other features (triglyph and metope systems, for example, in districts associated with Corinth). In the most elaborate examples, generally Hellenistic, the actual altar of sacrifice might be included in an elaborate architectural frame, as at the temple of Athena at Priene, or, most famously, the great altar of Zeus at Pergamum. The general rule, however, was simplicity.

The sacrifices would be attended, not only by human worshippers, but by the god, in the form of the cult image, and the greatest scope for architectural embellishment was the provision of housing for the image. This is the temple, which is literally the home of the god. Its basic form is the rectangular box, a room for the image, with a porch in front. In the simplest sanctuaries, even the porch may be lacking, but very often the temple was elaborated far beyond this. The starting point was the house as a hut. Very early temples, such as that of Apollo at Eretria, were little, if at all, distinguishable from contemporary hut houses. From this point, architectural development diverges. Houses become more complex in plan, with a multiplicity of rooms arranged round a courtyard. Temples retain the simple hut plan, but embellish it, particularly externally. The original forms use simple materials, timber, wattle, mud brick, thatch, and the only durable element is often a rough footing of field stones. During the 7th century BC the development of quarrying and stone-carving techniques led to the construction of temples built of local stone, generally a form of limestone. The decorative systems become more elaborate, with recognized standard regional forms, of the column, of the entablature the columns supported, and the embellishment of the roof. These constitute the "orders" of Greek architecture, Doric in the mainland and, generally, the west, Ionic in the islands of the Aegean and the east Greek areas. Marble is used where it is locally available (the Cyclades), while the temple of Artemis at Ephesus, supported by king Croesus of Lydia, took advantage of neighbouring quarries of marble to become the first colossal building in that material. Size was a matter of prestige and cost. Temples might increase the dimensions of their basic room, the cella, but this required internal supports (the temple of Artemis at Ephesus was unroofed). Size could also be made more impressive by the addition of external colonnades. The platforms on which these stood were stepped, but as size increased it is noticeable that often, particularly with Doric temples, it was essentially a matter of scaling up the smaller buildings: where these took three steps of reasonable dimensions to give access to the platform, the larger temples retained three steps as a convention, even though as a result they became too large to be of practical use, and special provision for access, a ramp or additional steps, would be needed at the front of the building. The 7th century BC was one of great innovation, but thereafter the forms of temple architecture were essentially static, development being restricted merely to the refinement of detail. Thus in basic appearance there is no real difference between the limestone temple of Artemis at Corcyra (Corfu), of the early 6th century BC, and the Parthenon at Athens, built between 447 and 436 BC. Both have eight-column Doric façades. The difference lies in the proportions of the columns and the Doric order in general, the proportions of the whole building, the refinement of its lines, and the quality and style of the carved decoration applied, as well as the difference of material that makes all this possible. Similarly, there would have been little significant difference between the temple of Artemis at Ephesus of the 6th century BC and its successor, built on the same foundations after the earlier building was destroyed by fire in 356 BC.

There are relatively few colossal buildings. The average important temple seems to have been about 30 m in length and less than 15 m in width. Within this width, the cella would be reduced to around 6 m wide, giving a reasonable room for the cult statue and the deposition of sacred objects, utensils, and valuable offerings, allowing individuals to admire the interior, but certainly not affording room for anything resembling a congregation. The worshippers gathered outside, and were not accommodated in buildings. Thus it was possible for many temples – probably the majority – to be much smaller, and certainly far less elaborate. The conventional view of a Greek temple as a peripteral building, that is, surrounded on its exterior with a colonnade, is misleading.

Other buildings in sanctuaries were ancillary, aimed at providing shelter for a variety of purposes. The most frequent takes the concept of the colonnade, with the orders invented for the temples, and applies them as façades for long, open-roofed porticoes, or stoas. They might provide shelter for worshippers, or for objects deposited in the sanctuary that could not go into the temple. They were useful for defining lines, and so, often, the boundaries of the sanctuary. They would not be so solidly built as temples, and thus are not so durable. Other buildings were more specialized. The core of the cult practices in most sanctuaries was the ritual consumption of the sacrificial victims, the meat being roasted and shared among the worshippers. Mostly it would be consumed alfresco – inevitably, given the thousands who would attend the major festivals – but in many sanctuaries buildings were provided to accommodate the couches on which a privileged few might recline. These often have a porch, with rooms accommodating 11 couches round their walls. Some provide more accommodation. The great banqueting building at Epidaurus had six 11-couch rooms, but also two large halls each holding more than 100. Such buildings were invariably arranged round a courtyard, and this principle, adapted from the now normal form of the Greek house, could serve a variety of other purposes, particularly the enclosed exercise ground. Other specialized buildings are found attached to sanctuaries, perhaps in an area away from the temple/altar complex, such as the open-air theatres and music buildings (odeia), and the stadium for athletic contests. Where a cult placed particular significance on performance, the theatre might well be architecturally dominant, with only an insignificant temple, as in the sanctuary of Dionysus at Athens. The entrance to the sanctuary on occasions (but not always) might be given an elaborate gateway building or propylon, two colonnaded porches placed in front and behind a wall with the actual door openings. The coherence of all these structures within the sanctuary would normally depend on the repetitive use of the architectural order; though use of the orders soon spread outside the

sanctuaries, they originated specifically in the religious context.

Some sanctuaries might require special buildings. Major sanctuaries, like Olympia or Delphi, which were international in character, were often given buildings as offerings by individual cities to the presiding deity; these "treasuries" generally took the form of miniature temples. Others had particular cult requirements, the most important being those cults where the ritual involved the performance of secret procedures seen only by people who had been initiated into the cult. Foremost was the cult of Demeter and Kore at Eleusis, where a large enclosed and roofed building was put up (following earlier and smaller structures) in the 5th century BC; eventually, this too was given a colonnaded porch.

Such sanctuaries continued to be built and used during the Roman period; the Roman form of temple was similar, but generally stood on an elevated podium, approached only from one end. There are surprisingly few specifically Roman-form (as opposed to chronologically Roman) temples in the Greek world, except at places such as Corinth, which had now become actual Roman colonies. Generally, Greek religion remained loyal to the Greek type of temple.

The acceptance by the Greek world of Christianity brought about a profound change. The new religion was both initiatory and congregational; it required closed buildings in which the ritual could be performed, but large enough to accommodate the congregation. The model for this therefore was not the pagan sanctuary with its outdoor altar and sacrifices, but the Roman basilica, a building form that had developed in the 2nd century BC, almost certainly from Hellenistic royal origins (hence its name), but used by the Romans essentially for secular purposes: legal actions, political gatherings, commercial transactions. It would normally be one of the buildings attached to the forum of a Roman city, and comprised a rectangular hall with a platform for a presiding magistrate or judge, usually at one end, and formed by an apse projecting from the main hall. To support the roof, it was divided along its length by two rows of columns supporting a clerestory, with the roof itself carried on wooden beams. Because of developments in Roman woodworking technique it was now possible for the central nave to be reasonably wide; together with the aisles to either side it could hold a congregation easily. In secular Roman architecture the form of the building remains conservative for most of its history. The columns bear a horizontal architrave, and the roof supports remain wooden.

Such a building required virtually no modification to serve as a church. The apsidal tribunal, filled with semicircular tiers of seats, accommodated the priests. Privacy was maintained during services by the construction of a closed porch across the front of the building, the narthex, to which the catechumens, those seeking to become members of the church, would be admitted and from which they could glimpse the proceedings. Outside this, and in major examples, an enclosed colonnaded court provided additional privacy. Such Christian basilicas were built at Rome (Old St Peter's, San Paolo fuori le Mura) and at Constantinople, as well as in the older Greek cities. There was a particularly large and splendid basilical church at Lechaion, the harbour town of Corinth.

An alternative form of church developed in the Greek areas. It seems to have originated with a special type of building devised to embellish burial places, particularly of people designated saints; a most important example was the church covering the Holy Sepulchre in Jerusalem. For this an alternative Roman form of construction, the dome, was adopted. In the first instance it came over circular buildings, and is obviously related to a whole range of Roman secular structures. At the same time, there were large roofed halls in other structures, where the roofs were not supported by wooden beams, but formed by concrete vaults, particularly the great cross-vaulted cold rooms, the frigidaria, of Roman imperial bath buildings. One secular basilica, that of Maxentius and Constantine at Rome, had already employed this system in a freestanding building. The new development was to combine the domed structure with the vaulted hall, using the device of pendentives to transfer the circle of the dome to a square of massive piers linked by arches. In front of this, the nave and aisles would be vaulted over piers linked by arcades; behind, the projecting apse, as in colonnaded basilicas, was covered with a semidome. Subsidiary domes might replace the vaults in the body of the church. Such construction culminates in the great churches of St John at Ephesus, and Hagia Sophia at Constantinople. Although there is no hard and fast rule, later churches in the Greek east tend to the domed form, those in the west the basilical. Thus it was the Orthodox domed church that influenced the Islamic architecture of the Ottoman empire, while in the west the basilica led to the medieval cathedral.

The subsequent influences of Greek religious architecture are varied. The form of the Classical temple, or rather of its colonnaded porch, can be adapted to a range of buildings, and this was done particularly when direct knowledge of ancient Greek architecture was reacquired in the 18th century; through Roman architecture, similar porches in the Corinthian order were already added to churches. Perhaps the oddest example of a revival of ancient Greek forms is the church of St Pancras in London, which incorporates, most incongruously, the decorative forms, including the porch of the Maidens, originally used at the Erechtheum at Athens. That this was unsuitable for church architecture was noted almost immediately.

Archives

Antiquity

Archives, in the modern sense of the term, were slow to appear in ancient Greece and even then never really corresponded to their modern counterparts in form or function. Oral tradition remained paramount at least until the 5th century BC. Written documents were not necessarily viewed as authoritative or considered important in and of themselves until relatively late in the Classical era. While the Mycenaeans certainly created written records, as witnessed by the many surviving tablets in Linear B, little can be said about their retention and organization. Record-keeping remained sporadic and unsystematic throughout the Archaic period. Cities often recorded important public documents, such as laws, lists of officials, and treaties, on stone. These inscriptions might be found in a variety of locations and in no way constituted a single collection of public records, although groupings of inscriptions are sometimes referred to as archives. Both individuals and cities often used temples as repositories for documents; Heraclitus, for example, allegedly deposited a copy of his writings in a temple of Artemis. Records not deemed worthy of stone were consigned to less durable media, such as wooden tablets (*pinakes*), whitened boards (*leukomata*), and papyrus.

Athens instituted a central archive, the Metroon, in the late 5th century BC (probably between 409 and 405 BC). This was placed in the old council house (Bouleuterion), when a new council house was built on an adjacent site. The building served as a shrine to Demeter as well as the archive, hence the name Metroon. The archives were under the jurisdiction of the Council (Boule) and were staffed by public slaves. It is likely that the contents originally consisted largely of council documents: decrees, correspondence, treaties, etc. As in the past, the keeping of administrative records usually remained in the hands of the individual officials. Many of these officials failed to keep records or treated them as temporary mnemonic devices to be destroyed once their purpose was served. Later in the 4th century BC other documents, such as laws, came to be placed in the central archives. Individuals began depositing personal documents in the public archives at some point in the late 4th century BC. Epicurus deposited his will (Diogenes Laertius, 10. 16) and probably copies of many of his writings in the Metroon.

By the later 4th century BC the use of written documents was increasing. Greek cities of the 4th century BC and Hellenistic period usually had an archive or record office. These served as depositories for the original copies of public records, usually on papyrus or parchment. Private documents, such as contracts and wills, were also frequently deposited in city archives (Aristotle, *Politics*, 1321b). Important public documents might be inscribed on stone in a public place as well; these have sometimes survived. The contents of these "stone archives" tended to be selective and focused on a particular theme. The documents often concerned the rights and privileges of the city. At Priene a small archive on stone preserved decrees and letters of Alexander the Great and Lysimachus that apparently granted various rights to the Prienians. Similarly at Aphrodisias a number of inscriptions document relations between the city and Rome from the late Republic to the time of Septimius Severus with the aim of establishing grants of autonomy and immunity to the city by Rome. Local cults and festivals also figure prominently in Hellenistic inscriptional archives. An example is an archive from the agora of Magnesia-on-Maeander, which concerns the Panhellenic festival of Artemis Leukophyrene.

The best-known and most developed Greek archives are those found in Ptolemaic and Roman Egypt. These tended to be more elaborate than those found elsewhere in the Greek world, reflecting the highly bureaucratic nature of Egyptian society. In addition to the central archive in Alexandria, each district (*nome*) had its own archive, which kept records of many private transactions as well as official ones. Many larger villages had their own record offices (*grapheia*) which kept local records and sent copies or summaries of these to the *nome* archives. The workings of the *grapheion* in the village of Tebtunis during the 1st century AD are particularly well understood thanks to the many surviving documents. In the Roman period the *nome* archives also sent summary records to the central archive in Alexandria. Many private archives of Graeco-Roman Egypt also survive in part. While some of these represent accidental groupings of related papers, others indeed represent conscious record keeping by individuals or families. Some of the better known archives of this type include those of Zenon (3rd century BC), Nemesion (1st century AD), Heroninus (3rd century AD), Aurelius Isidorus (4th century AD), Abinnaeus (4th century AD), and Dioscouros of Aphrodito (6th century AD).

Byzantium

There can be no doubt that documentary archives were compiled and carefully maintained in Byzantium. The survival of over 40,000 Byzantine lead seals is firm evidence for the production of large numbers of documents, which would have needed to be preserved, whether by secular or ecclesiastical officials, monasteries, cathedrals, or private individuals. The imperial archives in Constantinople appear to have been extensive and very well organized. According to the 6th-century writer John Lydos, the legal records of the Praetorian

Prefecture of the East were kept in vaults beneath the seating area of the hippodrome, and stretched for some 300 m. Byzantine historians often had access to the imperial archives and quoted relevant documents in their works (e.g. Anna Komnene, *Alexiad*, 3. 6. 156).

Sadly, the administrative archives maintained by the Byzantine government have now completely disappeared, those in Constantinople probably having been destroyed in 1204 or 1453. The only exception are the records of the exarchate of Ravenna, the capital of Byzantine Italy from about 568 until 751, which date from 445 onwards, and which are preserved in the State Archives and the Archiepiscopal Archives in Ravenna. The 6th- and 7th-century papyri are particularly informative about the Byzantine administration of the exarchate and the activities of soldiers and officials. Otherwise such Byzantine imperial documents that do survive have done so by chance and are preserved as isolated examples in libraries and archives all over the world. The British Library in London, for example, has a letter of the emperor Manuel II Palaiologos, dated 3 February 1401, with part of the seal still attached. Written in Latin, it thanks the king of England (Henry IV) for a gift of 3000 marks towards the defence of Constantinople (Nero, B. xi, f. 174). The work of Franz Dölger and others has done something to replace what has been lost, by compiling a chronological survey of imperial acts drawn from these isolated survivals and from references in literary works. A similar task has been carried out by B. Hendrickx for the period of Latin rule in Constantinople, 1204–61.

Much the same has to be said about ecclesiastical records as about imperial documents. The existence of the office of *chartophylax*, or Guardian of the Documents, in Hagia Sophia suggests the existence of a patriarchal archive in Constantinople, but again nothing has survived. The acts of the patriarchate of Constantinople which are recorded in literary sources have since been gathered and published by V. Grumel and others.

Yet, although the great imperial and ecclesiastical archives of Constantinople have not come down to us, some collections of documents compiled in the Byzantine period by monastic communities are still intact. Of these the most important are to be found in the monasteries of Mount Athos, which contain numerous charters of the Byzantine period, surviving either in their original form or as copies. The richest collection is that of the monastery of Vatopedi, which has about 250 Byzantine documents. The Great Lavra possesses 172 charters and acts from before 1453, the oldest being a deed of sale dated 897. The monastery of Iviron has some 150 Byzantine documents, including the will of Kale Pakouriane (1090), which gives a detailed description of the lands, icons, and liturgical vessels which she bequeathed. The Serbian monastery of Hilandar has over 300 Greek and Serbian documents from the medieval period.

Other monasteries on Mount Athos, notably Dionysiou, Docheiariou, Esphigmenou, Koutloumousiou, Pantokrator, St Panteleimon, Xenophontos, Xeropotamou, and Zographou, have smaller collections of Byzantine documents, concerned mainly with land transactions or property disputes. Karyes, the administrative centre of Athos, has 13 documents from the period 883–1406, which are primarily regulations concerning all the Athonite monasteries. They include the famous foundation charter of the emperor John I Tzimiskes, dating from between 970 and 972 and known as the *tragos*, or "goat", because it was written on a large piece of goatskin, and that of Constantine IX Monomachos (1045). These archives are of vital importance to the Byzantinist not only for the light which they throw on the practice of monasticism, but also for the information which they provide on agrarian conditions, ethnic composition, literacy, and economic development. Since 1937 a systematic survey and publication of the documents from Athos has been in progress in Paris.

Monasteries other than those on Athos have preserved collections of documents from the Byzantine period, and what follows is by no means an exhaustive list. St John the Theologian on Patmos has a rich archive containing imperial privileges, land surveys, and private acts, and the Theotokos Eleousa in Stroumitza in Macedonia has a chrysobull of Alexios I Komnenos dated July 1085, along with numerous other documents. The Nea Mone of Chios preserves chrysobulls and charters of a number of emperors from Constantine IX to Andronikos II Palaiologos which are informative about land ownership, the status of the peasantry, and taxation of the Jews. Several monasteries in southern Italy, an area which was part of the Byzantine empire from the mid-6th century until 1071, have preserved relevant documents. The monastery of St Elias and St Anastasius of Carbone in Calabria, for example, still has eight Greek documents, including a number of wills, from the period 1007–61, in spite of two damaging fires in 1174 and 1432. For the later period, the monastery of St John the Forerunner on Mount Menoikeion near Serres has important Byzantine, Serbian, and Ottoman documents from the 13th century onwards.

Finally, a number of archives in western Europe, although not Byzantine in origin, contain much information about the Greek world in the period 1204–1453. The archives of the Order of St John, held in the National Archive of Malta, throw light on the condition of the Greek population of Rhodes under the rule of the Knights Hospitallers up to 1522. The administrative records preserved by the Italian maritime republics, especially Venice and Genoa, contain a vast amount of documentary information about Byzantium in the later period. Of particular importance are the records of the deliberations of the Venetian senate on matters of policy towards Byzantium in the years 1293–1453, which often include a detailed discussion of events which are not mentioned in the literary sources. The deliberations have been summarized by F. Thiriet, while J. Chrysostomides has recently published a collection of documents from Venice and elsewhere which concern Latin-ruled Greece. However, the Venetian State Archives also contain a great deal of relevant material which has yet to be systematically explored.

Modern

For the greater part of its history, and until the War of Independence (1821–27), the official archive material relating to modern Greece originated chiefly from foreign administrations, notably Latin and Ottoman, which ruled the Greeks until they attained independence. With the fall of the Byzantine empire in the 15th century, the state bureaucratic record-keeping tradition of the Byzantines continued principally in the Venetian-ruled Greek lands. Venetians were renowned for their habit of meticulously maintaining extensive records in the places they administered; in fact, such importance did they place on records that they would negotiate with the Turks their safe return to Venice when they pulled out of a dominion. The Venetian archives, preserved nearly in their entirety to the present day, provide a valuable source for the history of Latin rule in the east (Crete, the Ionian islands, the Peloponnese, and Cyprus). In the Ottoman-ruled lands of Hellenism, sultanic bureaucracy and religious law favoured a regional archival policy, centred around the responsible *qadi* (Muslim religious judge), who was expected to enter every decree of the central government in his codices before it took effect in the province. In parallel, the decentralized administrative and taxation system, in cooperation with the Orthodox Church and local communities, allowed the preservation of records to be an activity largely shared with independent and private bodies. Accordingly, apart from the archives of the Turkish authorities and the old repositories of the monastic complexes at Meteora and on Mount Athos, archives were kept at the time by church authorities, communities, schools, notaries, guilds, and subconsulates. More specifically, given the lay jurisdiction with which the Church was vested during the Ottoman rule, church archives became depositories of collected material of broader interest pertinent to all walks of life of the Orthodox subjects. In addition, important and multifarious material was left by scholars, ecclesiastical figures, merchants, teachers, and other individuals in collections of private documents, letters, commercial registers, notes, etc. Lastly, on the fringe of and outside the empire, namely in the Danubian principalities and in Europe, Greek communities kept their own archives illuminating in detail the activities and the organization of the Hellenism of the diaspora (16th–19th centuries). By the end of War of Independence, a great deal of material from the archives of the Ottoman lands had been destroyed and continued to be destroyed in the Greek-inhabited lands of Turkey which were later incorporated into Greece. Still, enough of it survived the turmoils to reach the independent state, providing an invaluable source of historical knowledge.

It was from the outbreak of the Greek revolution onwards that the first Greek official documents were issued by the insurgent Greeks in their struggle to establish a rudimentary state structure. The rapid proliferation of these documents pointed to the need for their proper preservation, so that, at the time of Ioannis Kapodistria (1828–32), the first head of independent Greece, a public service was set up for this purpose. This was suppressed later on, at the time of the Bavarian regency (1833–35), and the preservation of historical state papers was entrusted to the Court of Audit (*Elenktiko Synedrio*). By the end of the 19th century, however, much of the material had been auctioned off, while further volumes of documents lay forgotten in public basements. In the 19th century Romanticism, in its quest for the national past, gave Greek historical studies and archive research a boost; but, despite the fresh preoccupation with the past, emphasizing the need for collecting and arranging primary historical material, the new intellectual trend failed to translate into a public record-keeping policy. Only diplomatic records attracted state protection from the beginning, for since 1832 King Otho had assigned their preservation to the newly established Secretariat of State of the Royal House and External Relations (the foreign ministry's predecessor). Provisionally, the Historical and Ethnological Society of Greece, since its foundation in 1882, made up for state inertia by saving much archival material, notably relating to the War of Independence.

To the complications in the formation of a structured record-keeping policy in Greece was added the piecemeal unification of the country; the state found itself provided with the well-organized archive services of the annexed regions (Ionian republic, 1864; Cretan republic and Samos principality, 1913) before it established a principal state record office. This was set up only in 1914, under the Venizelos government, with the foundation of the General State Archives (*Genika Archeia tou Kratous*). Their housing for decades in a wing of the Athens Academy building proved highly inappropriate for the preservation of the material.

Even nowadays the state of the historical archives in Greece is far from being a cause of national pride by modern standards. This situation reflects the chronic failure of the country to include research in its public priorities, and, culturally, is related to a national reluctance to address questions of historical self-awareness. Sadly, voluminous records of modern Greek history still moulder in public warehouses – a massive testimony to the need for a fully fledged state record office, the process of the completion of the new building for which has

been under way since 1976. In parallel, the principal old-established public archives make no secret of their difficulties. Poor in funds and in research facilities, understaffed, and the victims of official apathy, they can prove a test to the unsuspecting scholar's stamina. Moreover, it is only lately that the state archives are being staffed at last with graduate archivists. Lastly, relics of a lingering attitude of national secrecy over archival records may cause additional frustration, particularly to scholars exploring 20th-century issues touching on current national sensitivities (minorities, Macedonia, Thrace, matters relating to current Graeco-Turkish frictions, contemporary politics, etc.).

Nevertheless, the policy of numerous institutions, societies, and organizations, as a rule loosely associated with the state, has shown a fresh outlook. They have set up and enthusiastically arranged their archives, and encouraged access to records which had long remained unknown to the general researcher. This serves also as a verification that the national long-term project of compiling the definitive corpus of the Greek archival collections throughout the country has some prospect of one day attaining its objectives. As regards Greek historians, archival and research institutes and societies have to their credit popularized over the last 20 years a new pattern of openness and experrise in the management of historical records, breaking free from the "research-unfriendly" tradition. Moreover, the introduction of fresh matters within the scope of historical research, in parallel with the traditional ones of political and diplomatic history, has encouraged the creation of steadily growing archive units. There now follows a rough outline of the available archives of interest to the student of modern Greek history.

The General State Archives, ever since they were founded, have constituted the largest and principal archival repository for all aspects of modern Greece. They have authority over state historical records (excluding those of the foreign ministry), and de jure collect material from all the ministries and state directories (the 50-year rule applies). The main sources span the period from the War of Independence (or Greek revolution, 1821–27) onwards, but the material after 1863 remains unclassified. They are divided into four categories: Revolution archive (1821–27); Kapodistrian archive (1828–32); archive of Otho's reign (1833–62); and archive of George I's reign (1863–1913). Other records include the Yannis Vlachogiannis (first director of the archives) collection (mostly on the Greek revolution); the dossier of the Mixed Commission on Ottoman Estates (1829–77); and the Mavrokordatos papers (1833–80). Of the 20th-century archives, most significant are the Population Exchange Files on Asia Minor Hellenism; that of Kapetan T. Vardas (1905–30), fighter of the Macedonian struggle; and the papers of the premiers I. Metaxas and, in part, E. Tsouderos.

Regional records are preserved with the archive services organized on a prefecture basis under the aegis of the General State Archives. Apart from the fact that the irregular integration of Greek territories into the Greek state gave extra emphasis to the study of regional history as a field in its own right, some of these archive services (namely those of Crete, Samos, and especially the Ionian islands) amassed particularly valuable material from the structured archives kept under foreign administrations. Thus, Cretan history, for example, from 1669 onwards is traced through the Historical Archives of Crete in Chania and Heraklion (containing records ranging from the material of the Turkish archives and the archives of the Translation Offices and the ecclesiastical court, up to the 19th-century collections of the Cretan revolts and the Cretan principality). Similarly, the records from the Archives of Corfu and Levkas (Santa Maura) provide valuable sources for Ionian history during Venetian rule (16th–18th centuries); the Historical Archive of Samos contains a mass of material spanning the entire history of the island (1725–1950), especially as a principality (1834–1912). This is also illustrated by the preservation of the contemporaneous Italian occupation archive (1912–45) with the archive of the Dodecanese, on Rhodes, annexed only after World War II to Greece. Lastly, among regional archives, the Archive of Macedonia in Thessalonica merits a reference for its hundreds of manuscripts (18th–19th centuries).

The Historical Archive of the Greek Ministry of Foreign Affairs, where the country's diplomatic records are kept, is the other principal state archive. Dating from 1822, but chiefly from 1833 with the establishment of Greece as a modern kingdom, the records of the archive still reflect the 1833 classification (general correspondence, legations and consulates, official royal correspondence, treaty papers, treaties, and miscellaneous). The archives open to research today are divided into three sections: (1) General correspondence containing the ministry's drafts of dispatches to its envoys abroad, and their reports to foreign governments. This arrangement is increasingly interspersed with files on particular topics, such as the Cretan revolution (1866–69), the annexation of Thessaly (1881), and the peace conference (1919) (2) Embassy and consular records (from 1834), containing *inter alia* the Greek consuls' reports from the Ottoman empire, a multifarious source on various aspects of its Greek-inhabited provinces. (3) Miscellaneous papers including separate dossiers on such varied and significant subjects as brigandage, taxation, commerce, and landed property. Here, too, much of the material held in the archive awaits classification before it can be accessible to scholars (recently, as a result of a policy of openness to research, the 30-year rule was adopted). Post-World War II records referring to Greece's accession to the European institutions are in the possession not of the Historical Archive but of the General State Archives of the ministry.

The National Library (founded 1866) holds records relating to local history at the time of Ottoman rule, but sources mostly concern the War of Independence (fighters' archive). Later 19th-century collections held give information on various matters concerning the economy, justice, welfare, administration, and education. Here also is deposited the G. Georgiadis archive (1913–40) on the Italian occupation of the island of Rhodes.

The Library of Parliament (founded 1845) houses documents relating generally to the War of Independence (fighters' archive and correspondence of the revolutionary governing bodies), along with documents relating to parliamentary history (from 1844) and a few private collections of papers. *The Benaki Library* annexe (founded 1928) holds a collection of some 3600 newspaper titles (1789–1970), the second largest in the country after that of the National Library.

The Gennadius Library (founded 1926), named after its founder Ioannis Gennadius, a devoted bibliophile, is much used by scholars in Athens. Ottoman-ruled and modern Hellenism (especially the Greek Enlightenment, War of Independence, travellers' literature, and the Eastern Question) are very well represented in its comprehensive bibliographical and documentary holdings. Archival collections contain the documents of Ali Pasha of Ioannina; Ioannis Gennadius's personal archive; the correspondence of K. Mousouris (Turkish ambassador to Athens in the 1840s); the archives of the Dragoumis family, which achieved distinction in society and politics (1840 to present); A. Souliotis-Nikolaidis papers on the Macedonian struggle; part of E. Tsouderos' papers (World War II); and also manuscripts and papers of personalities such as the poets G. Seferis and O. Elytis and the conductor D. Mitropoulos.

The Benaki Museum (founded 1930) provides rich primary material for the study of the period 1814–1974. It holds 550 archival units, or about 500,000 unbound documents, partly sorted. More specifically, its records bear on the *Philiki Hetaireia* (Friendly Society); the Greek revolution; the Kapodistrian and Othonian periods (notably the D. Kallergis papers); the Cretan question 1866–1905 (*inter alia*, the archive of the provisional administration and the papers of Colonel T. Vassos and Prince George); the Macedonian struggle and the Balkan Wars. Greek politics (1900–25) is illuminated by the Benaki and Venizelos family archives and the papers of important Venizelists (N. Plastiras, G. Ventiris, I. Politis, P. Danglis). In addition, collections of outstanding literary figures (Angelos and Eva Sikelianos, C. Cavafy, P. Nirvanas, K. Palamas, and others); contemporaneous files on national resistance (1941–44); and the premier A. Korizis papers (d. 1941) are held. There is also a well-stocked archive of some 4000 photographs.

The Historical and Ethnological Society of Greece contains an archive relating to the period of the Greek revolution. The society is based at the National Historical Museum (formerly the old parliament building), and since its foundation in 1882 has collected important material on the entire Hellenism of the east. Records include particular dossiers on the Cretan revolution of 1866–69 and the Macedonian struggle.

The Greek Literary and Historical Archive (ELIA), a private archival society founded in the mid-1960s, is today a privileged source for research for the student of modern Greek history. Especially strong in family archives spanning periods from a few decades to 150 years, ELIA boasts a particularly broad variety of records to meet the wide-ranging interests of the scholar of political, social, economic, intellectual, and cultural history. Its historical archive consists of hundreds of collections of papers from the revolutionary period up to the time of the German occupation (1941–44) and the Greek civil war (1945–49). These include papers of fighters in the War of Independence; families eminent in public and intellectual life (Valaoritis, Gerulanos, Romas, Eftaxias, Streit, Bountouris, etc.); the papers of Trikoupis covering *inter alia* his correspondence with King George I on foreign policy; the papers of Venizelos (1910–20) and some of his associates; and collections of papers shedding light on contemporary history (Metaxas regime, occupation, and resistance). Also at ELIA are a specialized library of 14,000 titles of rare 19th-century printed books and pamphlets; a collection of 300,000 photographs (from 1860 onwards); a rich map collection of Greece (1830–1950); and the archive of the Greek colony in Egypt (*c.*1850–1950).

The Institute of Neohellenic Research of the National Hellenic Research Foundation, which deserves credit for the dissemination of a fresh attitude to archival research in public life, itself possesses a small number of collections: the A. Louriotis papers (1809–35); A. Pallis papers (1912–64); A. Karatheodoris papers (1816–1906); K. Schinas and P. Argyropoulos papers (1823–80); the Gerousis Trade House archive (1823–1925); and microfilm collections including that of modern Greek portraiture (7000 photographs of distinguished personalities, 15th–20th centuries).

The British School of Archaeology holds among its archives the historian George Finlay's collection of papers concerning the Greek revolution and the period of Otho's monarchy.

For the study of Asia Minor Hellenism until its exodus in 1922, *the Centre for Asia Minor Studies*, a private research centre, holds an oral history archive, unique of its kind, of 150,000 pages, arranged by communities and regions, along with manuscripts (1856–1924), a photographic archive (5000 items), and a specialized library. Other historical societies dealing with specific regions, such as *the Thracian, Epirot, Peloponnesian Studies Societies*, and others, keep significant archive material.

On the study of the Greek civil war and the communist movement (1918 to the present day) the *ASKI Archives* (Contemporary Social History Archives) accommodate part of the Greek Communist Party archives (1918–68), left-wing resistance organizations archives, archive collections and records of political refugees, far-left parties' and organizations' material, etc.

Among the plethora of scattered ecclesiastical archives, the Archives of the Catholic Bishoprics of Tinos and Naxos in the Cyclades deserve special mention for material relating to the early modern period of the area, as does the archive of the Thessalonica Metropolis, a significant source for Macedonian history from the mid-18th century onwards. As to monastic archives, the repositories of the monasteries of Mount Athos, along with the records at the monasteries of Patmos and Kalavryta (16th–18th centuries), are unparalleled.

Of numerous private historical archives in the possession of individuals, *the Pavlos A. Zannas archive* deserves mention as a rich source of documents, correspondence, and reminiscences from the late 19th century onwards. It consists of four archives covering themes from the Graeco-Turkish War (1897) and the Macedonian struggle to the Greek army's Asia Minor expedition (1919–22) and the Axis occupation (1941–44).

On military history, the archive of the *War Museum* holds collections of military papers and documents (1822–1949). The earlier ones include the D. Plapoutas–T. Kolokotronis correspondence (1822–24), General D. Deligiorgopoulos's documents (1828–41), and the Notaras–Petropoulakis archive (1832–67). The bulk of the material concerns archives of high-ranking officers in the wartime periods of 20th-century Greece (from World War I to the Greek Civil War). Likewise, the *Naval Museum* preserves material from naval operations, still in the process of arrangement. Also, the *Army History Directorate* keeps full records of Greek army operations

(Graeco-Turkish War, 1897; Balkan Wars, 1912–13; Asia Minor operations, 1919–22; Italian invasion, 1940–41; and the Korean War, 1950–53), including personal archives.

On the economic history of the country (19th–20th centuries), the *Historical Archive of the National Bank of Greece* provides a most valuable record of the economic development of modern Greece. Similarly, the *Agricultural Bank* has established its own historical archive illustrating the development of Greek agriculture; and other banks, too, have followed this line by arranging their archives for historical research.

Different aspects of modern Greek history and society can be traced through other archives held by various organizations, institutions, and societies. Thus, for example, the organization of higher education and the impact of the national university on Greek culture and ideology are illuminated by the archive of *Athens University* (founded 1837). Also, the course of archaeological excavations in Greece from 1837 to the present day is chronicled through the archive of the *Archaeological Society*, supplemented by the archives of the foreign archaeological schools. For the study of Greek folklore, *the Greek Folklore Research Centre of Athens Academy* keeps some 4200 manuscripts of folklore interest (19th–20th centuries) and large audio collections of folk music. In addition, the archive of *the Greek Folklore Society* provides primary folklore material from the early 1900s, including the collection of G. Megas, a university professor of folklore.

Moreover, a multitude of private societies and unions have opened their archives to scholarly research, a fact reflecting the broadening of the historical field achieved in our time in understanding modern Greek society. Already knowledge of the history of the Greek workers' and trade union movement has been advanced considerably by the research into archives of workers' centres and trade union organizations. Now there is further interest in the archives of industrial enterprises such as that of the French Mining Company at Laurium (1876–1980). The study of medical care and epidemics is served by the archive of the *Evangelismos Infirmary* (from 1884), made up of patients' files, medical reports, and administrative documents. Of learned and literary societies, *Parnassos* (founded 1865), which achieved early prestige among the scholarly coteries of Athens, preserves the archive of N. Levidis (minister and historian, 1848–1942), as well as miscellaneous material from the political and cultural elite of the time. On Greek women's studies, there is the archive of the *National Council of Greek Women*, dating from 1908, which keeps the council's correspondence with the European Department of the International Women's Council (CECIF). Lastly, *the Historical Archive of Greek Youth*, albeit not an archive literally speaking, focuses on material relating to the history of Greek youth, commissioning research projects on young people's involvement in all public and social activities (19th–20th centuries).

Modern Greek hisrory cannot be studied on the basis of records held in Greece alone. However, even an incomplete listing of archival sources of Greek interest abroad, such as the official archives of the Great Powers and those of the Greek communities of the diaspora scattered from France to Russia – to speak only of European sources – would lead us far beyond the purposes of this article. Suffice it to allure the reader with the idea that the mosaic of the ecumenical tradition of Hellenism would be reflected in a lively manner in this enthralling research journey: from the diplomatic records of the British Foreign Office and the Quai d' Orsay, through the archives of Vienna and the records of the Italian cities and the Vatican, northward to the state archives of St Petersburg, and eastward to the Istanbul Bachve-Kalet and the codices of the Orthodox patriarchates.

Arethas of Caesarea

Scholar and politician of the 9th to 10th centuries

Arethas was born in Patras. Nothing is known of the circumstances of his coming to Constantinople or of his studies. The Euclid in the Bodleian that he had copied in 888 terms him simply "Arethas of Patras"; he was then still a layman. By 895 he was a deacon with a role at the imperial court; in 902 or 903 he was made *protothronos* or metropolitan bishop (archbishop) of Caesaraea of Cappadocia, the first ranking among the sees subject to Constantinople. It has been suggested that he remained permanently in Constantinople, where his political activity took place. But although only Constantinople is named in his historical texts, his sermons point to residence in Caesaraea, and there is no reason to assume that he did not conform to the canonical requirements.

Arethas led the opposition to the fourth marriage of the emperor Leo VI (the "Tetragamy"). After burying three wives, in 905 Leo at last had a son by his mistress, Zoe Carbonopsina. Legitimizing this heir to the throne was paramount. Theodore of Stoudios's writings show that third and fourth marriages were quite frequent and allowed by law, but they were forbidden under canon law, which an emperor might find harder to circumvent than one of his subjects. The patriarch, Nicholas I (whose involvement in a plot to overthrow the emperor had been discovered), was eager to satisfy Leo. But although he managed to obtain an imperial baptism for the infant, he dared not disregard the opposition of the synod, led by Arethas and Epiphanios, metropolitan bishop of Laodicaea, to Leo's marriage. Leo had Arethas tried on a trumped-up charge and exiled, compelled Nicholas to abdicate, under threat of prosecution for high treason, and appealed to Rome. The pope sanctioned the marriage; a new patriarch was elected; Arethas and Leo were reconciled. Arethas's speeches and letters, as well as the scholia to a canonical corpus that he jotted down during the affair, supplement the other documentation. Like iconoclasm, the Tetragamy has received disproportionate attention because of the abundance of surviving sources.

Arethas had an enormous library for the days before printing, as attested by surviving manuscripts, by later ones with notes showing that they were copied from ones in his possession, and by marginal notes in various other manuscripts. His familiarity with Classical literature points in the same direction. Surviving manuscripts include: two volumes of Plato (one in fragmentary condition; when complete, the two manuscripts probably constituted an "Arethas edition" of Plato); Aristotle, poorly represented by the *Categories* and *De Virtutibus et Vitiis* (Arethas certainly owned more, for he describes himself as a "fiery enthusiast for Aristotle, and enquirer into his writings", and he quotes widely from him in the *Scripta Minora*); the oldest surviving manuscript of Euclid (mathematics was still part of philosophy, and hence of theology); an Aelius Aristides; the *Codex Apologetarum* with works by Clement of Alexandria, Eusebius, Justin, and Athenagoras (the manuscript formerly also included Tatian); and a copy of Lucian. He also mentions in a letter a Marcus Aurelius that he has just had copied; a Pausanias in Paris (Bibliothèque Nationale, gr. 1410) is a copy of a manuscript, now lost, that belonged to him; notes and scholia show that he probably also owned the *Orphica*, the *Life of Apollonius of Tyana*, the *Onomastikon* of Pollux, and he may also have owned a more complete Pindar than the one that survives today.

He quotes frequently from Homer (of the *Iliad*, all but three books, but only nine of the *Odyssey*), sometimes several lines, either literally or adapting the text to what he has to say. One of his letters begins: "I have often wondered, reading Homer, what could possess such a sage to have made his poetry from anything so bizarre as myths. If you ask me these should not be seen as myths but as allegories." This remark echoes Plutarch in *How Poetry Should Be Understood* (19e). The significance of the behaviour of the gods is one of the oldest themes in Greek literature, taking very diverse forms, and although the word "allegory" did not appear until later, the

idea is recognizable in Aristotle: "the ancients transmitted, in the form of myths, [the fact] that these things are gods" (*Metaphysics*, 8. 1074b). Arethas was also familiar with Hesiod, Thucidydes, Aristophanes (to whom he devotes a page of high praise), Gorgias, and many others. His commentary on The Book of Revelation is almost entirely derived from Andrew of Crete.

His scholia range from "*Or(aio)*" ("Good"), through notes on current affairs (dynastic, local, wars with Bulgars), topographical information, differences between spoken and Classical Greek, lexicology, archaeology, passing tussles with the author, etc., to full-scale "refutations" of the work in question.

Arethas's texts may be divided into those where profane quotations abound – both aggressively when he is responding to a personal attack, and urbanely in letters to friends – and those where there are none: sermons, dogmatic letters, the defence of his action before the synod (although quotations from Aristotle are occasionally present; he was not considered a "profane" author, but a professional source for theologians). A number of other Byzantine writings dealing exclusively with religion (including the *Corpus Dionysiacum*) lack profane quotations; it has been suggested that their authors were following the same policy.

Arethas's address to a Jewish public was apparently a serious attempt to convince them of the truth of Christianity from their own scriptures. His "Letter to the Vizir" (or "Emir"), which includes references to the Qur'an, is aggressive in tone throughout.

PATRICIA KARLIN-HAYTER

Biography

Born in Patras in the mid-9th century, Arethas made his way to Constantinople where he was ordained a deacon before 895 and archbishop of Caesarea in 902 or 903. He led the synod's opposition to the fourth marriage of Emperor Leo VI. Surviving manuscripts suggest that he had a large library and he was well read in Classical literature. He died after 932.

Argenti, Eustratios *c.*1687–*c.*1757

Theologian

Little is known about Eustratios Argenti's life. He was a native of Chios, where the Argentis had long been one of the leading families. After graduating from the Patriarchal Academy in Constantinople, he spent about ten years in the west, visiting Venice, Leghorn, Innsbruck, and probably Halle, and perhaps studying at Padua. During his time in Italy and Germany he acquired a good knowledge of both medicine and theology. Around 1720 he returned to Chios where he practised as a doctor. He married, but almost nothing is known of his wife Leonou or of his two children; one of his grandsons, Eustratios Argenti the Younger, was a close associate of Rigas Velestinlis, and the two died together as *ethnomartyres* [martyrs for their nation] at Belgrade in 1798.

From 1748 to 1751 the elder Eustratios was resident in Egypt, where he is known to have engaged in public debates with Roman Catholic missionaries. In a letter of 1751 he describes the precarious state of the Greek Orthodox patriarchate of Alexandria, in imminent danger of being taken over by Rome. In general he takes a pessimistic view of the situation of Orthodoxy throughout the Near East. The Orthodox, he writes, "will lose this second throne as well as the first throne of Rome; the other two, Antioch and Jerusalem, have almost been destroyed; and we shall be as the Armenians and the Maronites, the Copts and the Syrians, with only one Patriarch, of Constantinople, whom the Papists will afterwards expel root and branch with little trouble, when he is left alone and without his brethren" (in K.A. Uspensky, *The Patriarchate of Alexandria* [in Russian], vol. 1, St Petersburg, 1898, p. 346).

Back in Chios in the early 1750s, Argenti continued his anti-Catholic activities, and in particular during the rebaptism controversy he provided valuable theological support for patriarch Cyril V of Constantinople. The extent of his influence in his native island is evident from a report made in 1756 by the French viceconsul in Chios, who wrote: "One of the most effective ways of restoring tranquillity in this country would be to seize ... the doctor *Strati Argenti*, and to have [him] hanged." According to the viceconsul Argenti and two others, all of them "sworn enemies of Catholicism", were in control of the island, and "it is only by their downfall that it will be possible to avoid that of our religion" (in P.P. Argenti, *Diplomatic Archive of Chios 1577–1841*, Cambridge, 1954, pp.1010–11). As far as is known, the threat of hanging was not carried out. Although Argenti had certainly died before 1760, there is no reason to suspect that his end was anything but natural.

Argenti's published works are entirely theological, and they are all polemical treatises against Roman Catholicism. The most ambitious of his writings, the *Treatise against Unleavened Bread* (Leipzig, 1760; 2nd edition, Navplion, 1845), was written with the encouragement of the patriarch Matthew of Alexandria. Its scope is wider than the title suggests, and it is in fact a comprehensive discussion of all the main points on which Orthodox and Catholics differ in Eucharistic practice. Of the three parts of the *Treatise*, the first is directed against the Latin use of *azymes*, or unleavened bread, which Argenti sees as an unjustified innovation, conflicting with the apostolic and early Christian usage. The second and longest section

insists upon the need for an *epiklesis*, or invocation of the Holy Spirit, in the Eucharistic prayer of consecration. The third and final part attacks the Latin practice of withholding the chalice from the laity and of denying communion to young children. In the *Treatise* Argenti, following patriarch Dositheos and the Council of Jerusalem (1672), employs the term "transubstantiation" (*metousiosis*); but, unlike them, he refrains from applying to the Eucharist the distinction between "substance" and "accidents". The *Treatise* is not a work of great originality, but it is well documented and clearly argued; there is no other Greek work published on the subject in the period of the Tourkokratia that is comparable in its detail and thoroughness.

Argenti's *Manual Concerning Baptism* (Constantinople, 1756; 2nd edition, Leipzig, 1757) is much shorter than the *Treatise against Unleavened Bread* but has greater originality. Until the middle of the 18th century it was normal for Roman Catholic converts to the Orthodox Church to be received by anointing with the holy chrism. Cyril V, ecumenical patriarch from 1748 to 1751 and from 1752 to 1757, insisted that they should be henceforward admitted through the sacrament of baptism. This provoked a sharp controversy, but eventually Cyril's viewpoint was confirmed in 1755 by a synodical decree signed by himself and the patriarchs of Alexandria and Jerusalem. The practice of receiving Roman Catholics by rebaptism remained the norm in Greek-speaking churches until the late 19th century; since then it has been customary to receive them by chrismation, but rebaptism is still required in certain places, most notably Mount Athos.

In his *Manual Concerning Baptism* Argenti endorses Cyril V's standpoint. Immersion, he claims, is an essential element in the administration of baptism, symbolizing as it does the true significance of the sacrament as burial and resurrection with Christ; it can be omitted only in situations of emergency. The Latin practice of usually administering the sacrament by affusion (pouring water over the candidate's forehead) renders their baptism null and void. Another book advocating the rebaptism of Latins, *Sprinkling Pilloried* (Constantinople, 1756), often attributed to Argenti, is almost certainly not his work; the author is probably Christopher the Aetolian.

Argenti also wrote a *Short Treatise against the Purgatorial Fire of the Papists*, edited by Michael Constantinides (Athens, 1939). Here he allows for a middle state between heaven and hell, where the souls of the faithful departed are "neither honoured nor punished"; but this middle state is in his view altogether different from the Latin purgatory, since the souls there do not undergo "expiatory chastisement and torment". Argenti's treatises on papal infallibility and on the identification of the pope with the Antichrist survive in manuscript but remain unpublished.

In his anti-Latin polemic Argenti says relatively little about the *filioque* clause. An interesting passage in the *Treatise against Unleavened Bread* singles out the rationalism of Latin scholasticism, with its excessive dependence upon Aristotelian philosophy, as the basic cause of the schism between East and West (1st edition, pp. 171–72). Although trained in the terminology of western theology, Argenti himself is neither a Latinizer like Dositheos of Jerusalem nor a Protestantizer like Cyril Lukaris, but he stands apart from both of the westernizing "schools" of 17th-century Orthodoxy. In contrast to his younger contemporary Evgenios Voulgaris, he shows little sympathy for the world of the western Enlightenment. Essentially a conservative, he has more in common with Nikodemos of the Holy Mountain and the Kollyvades; but, unlike them, he makes no use of the tradition upheld by Gregory Palamas and the Hesychasts.

KALLISTOS WARE

Biography

Born in Chios *c.*1687, Argenti was educated at the Patriarchal Academy in Constantinople and spent ten years in western Europe, acquiring a good knowledge of both medicine and theology. Returning to Chios *c.*1720 he practised as a doctor and married. In 1748–51 he lived in Egypt and debated with Roman Catholic missionaries. He wrote a number of polemical treatises against Catholicism. He died *c.*1757.

Argolid

Region in southern Greece

The Argolid is most simply defined as the territory of Argos when it was a city state, but simple definitions are never complete. Argos came to control the entire plain which it dominates geographically from the west, but beyond that there are other areas which in a broad sense constitute part of the Argolid, but which were not part of Argos. Often the term Argolid is taken to include the whole of the area between the Saronic Gulf to the north and the Gulf of Argos to the south, but it is best restricted to the plain and its surrounding mountains, for within the wider area the plain of Argos is distinct from the mountainous and more broken region to the east. All the important communities are positioned in or around the plain; of those beyond, Epidaurus, though claimed by Argos, was rarely under Argive control, while the more distant cities of Troezen and Hermione were always completely separate entities. It is the Argive plain that matters.

Along the plain's southern edge is an extensive sweep of beach; though the ancient coastline was inland from this, it must have been similar. The plain extends northwards to form a roughly triangular area. Argos is almost at the southwestern corner; at the southeastern corner is Nauplia (modern Navplion), and, a little to the west, Tiryns. Mycenae is, more or less, at the northern apex. Today the best harbour and most important town are at Navplion. In antiquity Tiryns probably had little more than an open beach and probably used Nauplia's harbour. Argos is further away from the sea, but evidence for overseas trade is clear for the Archaic period, and some form of maritime outlet is certain.

Otherwise communication and access are by land. Until recently the main route, followed by road and railway alike, entered the plain from the north, from the territory of Corinth and its neighbour Phlious down past Mycenae. It left Argos heading south, where, near Lerna, the mountains come closer to the sea; it then went across a smaller plain, into the hills that took it up to Arcadia, the centre of the Peloponnese, or along the coast into yet another plain, the Thyreatis, the possession of which was long disputed between Argos and Sparta. The Argive plain was therefore of some strategic significance, coming between the central and southern Peloponnese and the north, but it was not as strategic as Corinth, which could block the passage from south to north absolutely. There were alternative routes past the Argive plain through the hills and mountains to the west, from Arcadia, past Tegea and Mantinea, across to Phlious, and down to Sicyon and the gulf of Corinth. The modern motorway follows part of this route past Mantinea and over to Phlious, although this is only achieved with the help of a substantial tunnel. Nevertheless, the pass over the mountains at this point was always feasible, and this was the route preferred by the Spartan armies.

The Argive plain is potentially fertile. Though no great river flows through it, the surrounding limestone hills retain the water, and there are abundant springs round its edge. It is here that the communities grew up, and there is much evidence for settlement already in the Neolithic period. By the Early Bronze Age there were important communities around the plain, especially on the site of Argos itself, but the period of greatest significance was undoubtedly the Late Bronze Age, generally termed the Mycenaean Age to give emphasis to the apparent predominance of that state. This is based partly on archaeological evidence, and partly on an interpretation of the Homeric poems, which give supreme authority to Agamemnon, king of Mycenae, over an alliance of the whole of mainland Greece. How far this reflected political reality is impossible to say, but in so far as there is evidence of a common standard of material existence and wealth in mainland Greece, the importance of Mycenae is certain, though it is an importance shared with the other communities of the Argolid.

How this wealth was acquired is unclear. Today the plain produces a mixture of crops, including citrus fruit, but in antiquity much of it was probably used for corn. Horse-rearing also seems to have been significant, particularly in the Late Bronze Age, and remains of horses have been found deliberately buried, presumably with their owners, in Late Bronze Age graves. Homer often mentions horse rearing and describes Mycenae specifically as "rich in gold", though this would have come from elsewhere. Mycenae, with its heavily fortified citadel, is often compared to a robbers' lair, but this is overdramatizing the situation: the fortifications are repeated at Tiryns and elsewhere in this period, and are essentially defensive. Control of the sea may have involved overseas raiding – the genesis of the story of the siege of Troy may lie in a memory of such activity – but trade and exchange, however it was conducted, is the likeliest explanation for the Argolid's wealth.

Argos seems to have been less important in the Late Bronze Age than in the succeeding Classical period, and this can lead to some confusion, since Athenians in the 5th century BC were liable to attribute the Homeric stories to the kings of Argos rather than Mycenae, which by the 5th century BC barely existed. More significant is the existence of a whole string of communities along the eastern side of the Argive plain, starting with Mycenae in the north. Not all their ancient names are known. Next to Mycenae is the locality known as the Argive Heraion, where the most important of the Classical sanctuaries developed. Graves indicate that there was a prehistoric settlement here. A short, dry gorge leads northeast to the small plain of Berbati, with hills all round except at the point of entry: again, a place of Late Bronze Age settlement. Further south are Dendra, with important graves, and Midea, with its long fortification wall leading to a remote hilltop site. Finally, at the southern end of this string of communities is Tiryns.

There is a pattern to these places. There is a reasonable degree of separation between them, so that they could function independently. They are all situated at springs, or where springs once existed, another clue to their existence. Whether they actually were independent, or whether they were all placed under the control of one authority, is not known. Mycenae and Tiryns were both equipped with structures suitable for a ruler and his needs. Their fortifications were very extensive, with spectacular and well-defended entrances. Inside the fortifications of both places was a rectangular building, with a porch at one end and a ceremonial hearth within. These buildings have been identified as palaces and would seem to have been where rulers could perform their official duties. Both buildings have storage space and have yielded evidence of imported goods from overseas. Mycenae, more than Tiryns, has massive cemeteries with different types of graves. The earlier shaft graves, which were excavated in the 19th century by Heinrich Schliemann, contained the fabulous gold treasures and other objects now in the National Museum at Athens. The later graves include the tremendous tholos tombs with their high corbel-domed chambers which, though mostly robbed centuries ago, still impress with their structural competence and scale. More ordinary graves, particularly rockcut chamber tombs, which are related in form to the tholoi, have been found at all the Late Bronze Age sites. Although these tombs probably belonged to people of lesser rank, they often contained offerings of value. Taking all this into account, and comparing it with other regions of Greece of the same period, it is clear that in the Late Bronze Age the Argolid was the wealthiest and the most important area of mainland Greece, and that it had taken over from the earlier supremacy of Minoan Knossos in Crete.

In the 11th century BC all this collapsed, despite the construction of massive fortifications in the principal centres. What eventually emerged in the 8th century BC was rather different. Some of the Late Bronze Age centres continued as communities, such as Mycenae, Tiryns, and Asine, near Nauplia. They may, like Mycenae, have patched up their stupendous fortifications. Mycenae's connection with the heroes of the Homeric poems was accepted, and the hero worship of Agamemnon was established in the greatest of the tholoi, which was identified as his tomb (or, alternatively, as the treasure chamber of his father, Atreus). Tiryns also continued to be inhabited, but, like Mycenae, seems to have had a much-reduced population. According to Herodotus, at the time of the Persian invasions in the early 5th century Mycenae and Tiryns, unlike Argos, sided with the anti-Persian alliance

and between them could only field an army of 400 men. The Argive Heraion was now a sanctuary, rather than a settlement. The lead undoubtedly had passed to Argos. Behind this development lies the arrival, into a depopulated region, of Dorian settlers who established themselves at Argos rather than the eastern sites, which perhaps overawed them with their massive remains. At Argos they settled on the lower ground below the citadel, just as at Sparta they chose a new, low-lying site across the river from the Bronze Age settlement. The eastern Argolid communities may have continued to be descended from the earlier population. The Argive Heraion, to judge from the objects deposited in it, at first belonged to its eastern geographical neighbours.

In the 7th and 6th centuries BC this changed as Argos took political control of the entire area. The Heraion now became the principal sanctuary for the whole of the Argolid. It was this that made Argos one of the major cities of Classical Greece, though its control was briefly broken as a consequence of the Battle of Sepeia in about 494 BC when it was defeated by Sparta, and Mycenae and Tiryns regained their independence. It was not long, however, before Argos recovered and reunited the Argolid under its control. But the Argolid never regained the preeminence it had enjoyed in the Late Bronze Age. The overseas trade, and the benefits of that trade, moved from the gulf of Argos to the Saronic gulf and Athens. All this is reflected at the Argive Heraion. The sanctuary is an important one. It contains the remains of one of the earliest peripteral temples in Greece which, although its columns were of wood, is likely to have been a forerunner of the Doric order. Destroyed by fire in 416 BC, it was replaced with a more up-to-date stone temple. Little of this replacement remains, apart from its foundations, but the sculpture, including the cult statue, was attributed to the greatest of the Argive sculptors, Polyclitus. Even so, and although in its design it shows Athenian influence, this temple nowhere approaches the Athenian buildings in quality or magnificence.

The later history of the Argolid is relatively uneventful, and is essentially that of the city of Argos. During the Roman empire the Argolid continued as a prosperous backwater, with most of the population probably living in the city. There is a Roman bath building at the Argive Heraion, which was excavated in the early 20th century, and which has partly eroded away. Otherwise there is little Roman construction outside the city. There are some good examples of late mosaic floors, now in the Argos museum, which indicate continued prosperity into the 5th century AD. Later still, scattered over the Argolid, and often incorporating the remains of Classical buildings, are a number of delightful but small Byzantine churches which suggest a population living in villages, most noticeably on the eastern side of the plain, and continuing a traditional pattern of life.

R.A. TOMLINSON

Summary

The Argolid is the plain that extends south from Mycenae to Argos, Nauplia, and the sea coast. Though it has no great rivers, it is potentially fertile and by the Late Bronze Age was the focus of an important group of sites, notably Mycenae and Tiryns, where spectacular archaeological finds have been made. Argos only emerged in the 7th and 6th centuries BC to dominate the region.

Argos

City in southern Greece

The city of Argos has a continuous history from the Neolithic period to the present day. It centres on two hills, the high acropolis, called the Larisa, to the south, and the lower, rounder Aspis to the north. The main area of settlement is on the eastern side of these two hills. Of the earliest occupation only traces remain, but of the Middle Bronze Age there is more substantial evidence, particularly on the Aspis. By the Late Bronze Age the hills were fortified. They look across the plain towards Tiryns, on the coast, and Mycenae, further inland. The relationship between the three communities during this period is imprecisely known; Argos may have been the least significant of the three, and as such perhaps the least likely to survive during their decline at the end of the Late Bronze Age. Whatever the reason, it was occupied by new settlers, of Dorian origin, who seem to have assimilated the descendants of the original population. By the 8th century BC Argos was again a flourishing city and a leading community in the Greek world as it emerged from the obscurity that followed the collapse of the Late Bronze Age states. It produced an abundant sequence of pottery decorated in the Geometric style, less refined than that of Athens, but equally vigorous. Much survives from local burials, indicating a degree of prosperity in the community. Even more significant is the suit of bronze armour – comprising a helmet, breastplate, and shield – that was found in one of the graves at Argos, named the "Panoply Grave" after this discovery. The bronze from which this armour was fashioned would have been imported, a sign of revival at Argos, and it probably indicates the first stages in the development of the form of warfare which led to the heavily armoured infantryman, the hoplite, of Classical history.

There is a tradition that at this time Argos controlled a wide area of the Peloponnese, but this was still a long time before true historical record began, and it may be an anachronism, either a reflection of the larger territorial states of the Late Bronze Age or the predominance of another city, Sparta, in the Classical period. It is unlikely that in the 8th century BC Argos controlled even the eastern side of the Argive plain.

During the 7th century BC Argos underwent changes. The city's pottery industry seems to have collapsed, or, at least, ceased producing vases to be deposited in graves. Political resurgence brought a certain Pheidon to power. He is described by Aristotle as a king (meaning, perhaps, that he exercised traditional religious and military power) who became an

authoritarian ruler (a tyrant, in the Greek sense) seizing control of the Olympic Games on the other side of the Peloponnese and engaging in war with the Spartans as well as with more closely neighbouring cities. He is also said to have introduced a standard of coinage, an anachronism for the 7th century BC and possibly again a misinterpretation. Whatever the truth of all this, Argos was by that time clearly becoming a major city, powerful enough to challenge Spartan supremacy in the Peloponnese, though not to prevail. At the battle of Sepeia (494 BC?) the Argive army was crushed by the Spartans, and Argos forced into a submissive peace. Subsequently Argos was invited by Athens and Sparta to join their resistance to Persia, but Argos tactfully set impossible conditions, so justifying its refusal and doubtless hoping to play the Persians against the Spartans. When the peace between Argos and Sparta expired after 30 years, the Argives, this time in alliance with the Athenians, challenged the Spartans but again were crushed. Nevertheless the city flourished. On the lower ground below the Larisa the agora was developed at this time, its edges being delimited in part at least by extended porticoes (stoas) of a thoroughly up-to-date form. A further attempt at victory over the Spartans, again in alliance with the Athenians, ended in defeat for the Argives at the Battle of Mantinea in 416 BC. In the years that followed Argos rallied support from other Peloponnesian cities who had turned against Spartan authoritarianism. This led to the so-called Corinthian War, during which an interesting political experiment, a union between Argos and Corinth, gave much alarm to the Spartans, who duly suppressed it.

A revival in the city's fortune came about fortuitously when the Macedonian kings, whose family name was Argeadae, claimed descent from the legendary kings of Argos, apparently on the dubious basis of the similarity of name and the invention of a fictitious genealogy. This meant, after the Macedonian victory of Chaeronea, that the Argives were in favour. Even after the death of Alexander the Great and the confusion which followed, Argos remained loyal to its Macedonian connection, and eventually to Antigonus Gonatas who ruled Macedon for much of the first half of the 3rd century BC. His enemy Pyrrhus tried to take Argos by surprise, but lost the initiative when one of his battle elephants (previously used spectacularly in his fruitless war with the Romans) got stuck under a city gate. Pyrrhus himself broke into the town, only to meet an ignominious death when an old woman dropped a heavy rooftile on his head. For much of the 3rd century BC Argos was ruled by pro-Macedonian tyrants, who were derided for their subservience by Greeks opposed to Macedonian supremacy, but who were perfectly acceptable to the citizens of Argos, who prospered as a result.

With the Roman conquest of Greece, Argos lost what prominence it had, and under the Roman empire was far less important than Corinth. It became a typical Roman provincial town, its prosperity signalled by public buildings, particularly a substantial bath complex of the 2nd century AD, the most extensive ancient ruin in Argos apart from the theatre, which cut into the slope of the Larisa and was certainly in existence early in the 4th century BC. Argos also retained in the Roman period the fortifications on the Larisa, large portions of which date from the 5th century BC. These were refurbished in the Byzantine period, when Argos continued as a small town, and resisted a long Frankish siege in the 13th century. The city's key position, on one of the routes from the north into the southern Peloponnese, ensured both its continuation and the maintenance and improvement (finally, during the Turkish occupation) of its fortifications.

The major contribution of Argos to the Classical tradition in the arts lay undoubtedly in the field of sculpture. The early Argives' skills in bronze working produced in the 7th century BC a series of decorated shields, primarily for dedication in the sanctuary at Olympia and probably reflecting the Argive involvement there. With the development of the lost-wax technique of hollow casting, these bronze-working skills were later applied to freestanding sculpture. The pioneer in this, Ageladas, is no more than a name. He is eclipsed by the 5th-century sculptor Polyclitus, perhaps a pupil, though the chronology is uncertain. Only copies of Polyclitus' works survive. One in particular, called the *Doryphoros* (spear-bearer), seems to have been produced as the sculptor's ideal of masculine human beauty. The form, as well as the style, influenced sculptors of the succeeding century, and in the Roman period Polyclitus was regarded as the supreme exponent of his art, so that Polyclitan forms are used, for instance, for portrait statues of the Roman emperors, such as the Prima Porta *Augustus*; others, incongruously, go even further and depict emperors in Polyclitan nudity.

R.A. TOMLINSON

Summary

City in southern Greece with a continuous history from the Neolithic period to the present day. After the Bronze Age, when it was overshadowed by neighbouring Mycenae and Tiryns, it was occupied by Dorian settlers and the city flourished during the Classical period, when it was noted for its sculpture.

Argyropoulos, John *c.*1415–1487

Scholar

John Argyropoulos was one of the most prominent of the Byzantine émigré scholars who took up residence in Italy after the capture of Constantinople by the Ottoman Turks in 1453. In his teaching at the University of Florence he won adulation rivalled only by that accorded to Manuel Chrysoloras, and his students included some of the foremost Italian humanists of the next generation.

In the years before the fall of Constantinople, Argyropoulos had belonged to the narrow circle of Byzantine intellectuals. He had taught rhetoric at the Katholikon Mouseion, or higher

John Argyropoulos, from a 16th-century engraving

school, and had written a number of rhetorical works in traditional style in praise of the emperors John VIII (1421/25–48) and Constantine XI (1449–53) Palaiologos. His reputation outside Byzantium began to grow from 1438, when he accompanied John VIII to the Council of Florence as part of the Byzantine delegation and became a supporter of the union of the Churches proclaimed there. He appears to have remained in Italy until about 1443, giving private lessons in Greek and studying Latin at the University of Padua. The knowledge of Latin that he obtained in this period undoubtedly stood him in good stead in the future, as did the contacts he made with such prominent Florentines as Palla Strozzi. He was once more in Italy in August 1454 as a refugee following the fall of Constantinople, and after a period in Greece at the court of the despot Thomas Palaiologos at Patras, he returned to western Europe in 1456 as an ambassador to the papal, French, and English courts.

It was while he was in Italy on this mission in October 1456 that Argyropoulos received an invitation from the Florentine statesman Cosimo de' Medici to take up the chair of Greek at the University of Florence, with a substantial yearly stipend of 400 florins. His teaching in Florence proved to be immensely popular, and served to revive the interest in Greek studies that had languished since the departure of Manuel Chrysoloras in 1400. His public lectures on Aristotle, given in the mornings, were thronged by eager listeners from all over Europe. In the afternoons he gave private lessons to some of the most prominent Florentine intellectuals, including Pallas Strozzi, the child prodigy Angelo Poliziano, Alamanno Rinuccini, Donato Acciaiuoli, the bookseller Vespasiano da Bisticci, and Cosimo's grandson, Lorenzo de' Medici, "the Magnificent". He came to enjoy something approaching celebrity status, becoming a leading member of the Accademia Fiorentina, a literary club that met in Rinuccini's house, and receiving a house in the Via Larga and Florentine citizenship in 1466.

Argyropoulos's popularity was probably due, at least in part, to two aspects of his teaching method. The first was the importance that he attached to speculative philosophy as an essential part of the curriculum, rather than adhering solely to rhetoric, the traditional mainstay of humanist education. In an introductory lecture given in November 1458 to his course on Aristotle's *Physics*, Argyropoulos, like Theodore Gaza before him, extolled the usefulness of Greek philosophy as a training for effective participation in political life. His lectures therefore covered ethics, logic, physics, and metaphysics, as well as rhetoric and the Greek language itself. Secondly, there was his choice of philosopher. Although personally an Aristotelian who accepted the traditional, scholastic interpretations of Aristotle's philosophy, in his private teaching Argyropoulos gave instruction in the works of Plato. His exposition of Plato proved to be so effective that many of his students, particularly Acciaiuoli and Rinuccini, transferred their interest from rhetoric to Plato's metaphysical philosophy, with important long-term consequences for the development of Florentine political thought.

As well as teaching, Argyropoulos was active as a translator of Greek texts into Latin. He prepared versions of a number of Aristotle's works, including the *Nicomachean Ethics*, the *Physics*, and the *Metaphysics*, all of which he dedicated to members of the Medici family. Unlike Manuel Chrysoloras and Theodore Gaza, however, he preferred a literal translation, distrusting literary elegance, which he considered likely to obscure meaning. This may explain why his translations were never as widely used as those of Theodore Gaza and cardinal Bessarion.

In spite of the high reputation he had obtained during his 15 years in Florence, in 1471 Argyropoulos moved to Rome for reasons that are not entirely clear. He may have been moved to leave Florence by the death of his patron, Cosimo's son, Piero de' Medici, in 1469, and by hopes of obtaining the favour of the Greek cardinal Bessarion. He had also found a new patron in pope Sixtus IV, Francesco della Rovere, whom he may well have met earlier at Padua in the 1440s. Argyropoulos remained in Rome for the rest of his life – apart from a short period in Florence in the years 1477–81 – giving public lectures in the Vatican on Greek philosophy and literature. His most prominent student in this last period of his life was the German humanist Johannes Reuchlin. He continued to translate Greek texts, notably St Basil's *Hexaemeron*. He died on 26 June 1487, allegedly from an over-indulgence in watermelon, but one tangible reminder of his time in Rome can still be seen today: his portrait appears in the frescos by Domenico Ghirlandaio on the walls of the Sistine chapel.

JONATHAN HARRIS

Biography

Born in Constantinople *c.*1415, Argyropoulos accompanied John VIII to the Council of Florence in 1438 and remained in Italy until *c.*1443. After the fall of Constantinople he returned to Italy and in 1456 was invited by Cosimo de' Medici to take the chair of Greek at the University of Florence. In 1471 he moved to Rome where he died in 1487.

Aristarchus of Samothrace *c.*215–*c.*143 BC

Librarian and scholar

Aristarchus was born in Samothrace *c.*215 BC and died at the age of 72 (we are told) *c.*143 BC in Cyprus. Most of his adult life, however, was spent in Alexandria, first as tutor to several young royals of the house of Ptolemy and then as one of a distinguished line of librarians at the most famous centre of learning in the Greek world, the Museum. His predecessors were Zenodotus, Apollonius of Rhodes, Eratosthenes, and Aristophanes. Although nowadays we tend to think of librarians primarily as cataloguers and maintainers of the texts in their collections, those at Alexandria were also scholars and occasionally, most notably in the cases of Apollonius and Eratosthenes, poets as well. (Callimachus, however, the most famous of Hellenistic poets and the compiler of the *Pinakes*, a list of authors and their works so complete that it could serve as library catalogue, never served as a librarian.)

Aristarchus has his detractors as well as fans, but despite the frequent difficulty in distinguishing his contribution from the vast amount of scholiastic material in the margin of extant Greek texts, especially the scholia of Homer, the overall nature of his contributions is clear. Like his predecessors, and much like any modern editor and commentator, Aristarchus was responsible for establishing the standard text and explaining his choice of readings and the meanings of puzzling words, expressions, character motivation, and overall meaning. Prose works, arriving in the library in fewer copies with fewer textual variants, required (or at any rate received) little work of this sort, although Aristarchus did write a commentary on Herodotus, some traces of which survive. Poetry, however, written in all the dialects ever spoken in Greece, to say nothing of the artificial forms that Homer and others felt free to create, and showing up – "published" is too narrow a term – in varying lengths for the same work and with a variety of lexical and morphological forms, required a battery of methodological skills. Homer and Hesiod, therefore, along with the more difficult lyric (notably Alcman and Pindar) and tragic poets, received the greatest attention from the Alexandrian poet-scholars.

The first task, as suggested above, was to establish a standard text, which in large part was derived from what was thought to be the best readings of preexisting manuscripts; but to a lesser extent, when the manuscripts were deemed unsatisfactory, editorial intervention was brought to bear. The gentlest instance of the latter was the use of marginal signs designed to alert the reader to questionable lines, which would be allowed to stand in the text. Aristarchus, for example, kept many lines which Zenodotus had expunged from his official text of Homer. A stronger measure would excise one or more lines or alter individual words.

Of all the poets treated by Aristarchus – Homer, Hesiod, Archilochus, Alcaeus, Pindar, Aeschylus, Sophocles, Euripides (very likely), and the comic poet Aristophanes – it is the author of the *Iliad* and *Odyssey*, thanks to the vast amount of carefully attributed scholia surviving in medieval manuscripts, who provides us with the best picture of Aristarchus' activities as both editor and commentator. In hundreds of places the scholia on Homer name Aristarchus as their source; in others a suggestion that is anonymous in the scholia is attributed to Aristarchus elsewhere, which strongly suggests that many other anonymous scholia owe their origin to him. We even on occasion learn his earlier views along with his later thoughts, as expressed in his second commentary on Homer. Some of the characteristics of Aristarchan scholarship are:

(1) Removing narrative inconsistencies. For example, to avoid inconsistency between Odysseus' account to Alcinous in book 7 of the *Odyssey* and Homer's narrative of the same event in book 6, Aristarchus altered a sunset in the earlier book to late afternoon, although, even if this was an inconsistency, rather than the result of yet one more bending of the truth on Odysseus' part, it would be Homer's and not that of a scribe; it would deserve not textual emendation so much as notice (with or without censure). In fact Aristarchus himself did this on other occasions in his separately published commentaries, as when he pointed out, without demanding alteration or excision, that the emissaries to Achilles in *Iliad* 9 ate two dinners on the same day (as what soldier could not?).

(2) Excising "improper" passages. Homer had been criticized for describing gods impiously as early as Xenophanes and most notably by Plato, but although the editorial vice of actually removing such passages is associated chiefly with Zenodotus, Aristarchus too is guilty of this. It is, for example, only thanks to Plutarch that we know the lines spoken by Phoenix in *Iliad* 9, where he says that he considered killing his own father, which were ejected from the text by Aristarchus and from all subsequent copies. But these lines are part of a long speech in which Phoenix artfully develops a parallel between his younger self and Achilles, who had threatened *his* superior, Agamemnon.

(3) "Explaining Homer from Homer". The idea behind this well-known phrase is an excellent starting point for any commentator, but Aristarchus could carry it too far, occasionally misinterpreting a Homeric word, when even a text so close in time to Homer as an early Homeric hymn would explain and defend Homer's usage. Since excesses of this sort were largely limited to his commentaries, they did not affect the text. Some close readings of the text, moreover, such as Aristarchus' attempts to understand the point of individual similes, can still stand.

Many of Aristarchus' readings were adopted by later editors and still appear in current editions. More important than any tabulation of his presence in later texts, however, is the example that he and his fellow Alexandrian editors left for their successors. For all that their methodology has been tempered with a greater understanding of Greek historical linguistics and the nature of poetry, their diligence and desire to explain all puzzling passages on rational principles remain the core of modern editorial practice. Their philology is our philology.

Biography

Born in Samothrace *c.*215 BC, Aristarchus spent most of his career at Alexandria. He was tutor to the Egyptian royal family. He succeeded Apollonius as head librarian of the Museum and was also a scholar and critic. He produced critical editions of Homer, Hesiod, Archilochus, Alcaeus, Anacreon, and Pindar. He wrote commentaries on Homer, Hesiod, Archilochus, Alcman, Pindar, Aeschylus, Sophocles, Aristophanes, Herodotus, and perhaps Euripides. He died in Cyprus *c.*143 BC.

Aristides, Aelius AD 117–*c.*180

Writer and orator

In many respects Aristides is a typical representative of the cultural tendencies of his age, the so-called Second Sophistic, while in others he cuts a rather peculiar figure. Born into a well-to-do family of the little town of Hadriani in Mysia, he acquired a thorough rhetorical education based on the great texts of the Greek classics and soon began to pursue the career of a professional speaker (a "sophist" in the parlance of the time) for the multifarious public occasions that the cultural life of his times provided. A long-lasting illness, however, with symptoms of physical as well as psychic distress, which broke out soon after he had returned from an educational journey to Egypt, forced him to curtail public appearances and to spend long periods within the precinct of the healing god Asclepius at Pergamum. Aristides himself documented these periods in his *Hieroi Logoi* (Sacred Discourses), relating how the god appeared in his dreams and gave him various (and sometimes quite strange) commands to fulfil, but also encouraged him to carry on with his rhetorical studies, promising that he might even surpass the great Demosthenes. The *Hieroi Logoi* thus reveal not only the workings of an overanxious and selfcentred mind, but also a singular determination to rival and outdo the best of the Classical authors he had been taught to emulate.

It was apparently in the AD 150s that Aristides was able to put his illness behind him and publicly perform some of his great speeches, among them the famous *Encomium to Rome*; in this he celebrated (not without some exaggeration) the civilizing power of the Roman empire that had given the Mediterranean and especially the Greek world a stable frame within which to survive and prosper (Aristides was a Roman citizen, a distinction probably inherited from his father). Like other Greek intellectuals of his time, however, he looked back even more to the glorious days of Classical Greece and wrote an even longer speech (the *Panathenaikos*, its title not fortuitously evoking its great predecessor written by Isocrates) extolling the cultural and political achievements of Athens in its most illustrious days. In a similar vein, his *Meletai* ("declamations", i.e. speeches conceived as if pronounced by some great historical figure in a certain historical situation) tried to bring back to life some of the most decisive moments of Classical history (e.g. the situation on the eve of the Battle of Leuctra in 371 BC; the Athenians deliberating about reinforcements to their troops fighting against Syracuse in 414 BC); and a number of hymns in prose – a genre of which Aristides even claimed to be the inventor – praised the gods of Classical religion. Still, at least some part of his rhetorical activity was also directed to the present. Like Dio Chrysostom, he addressed various cities and exhorted them to put aside their internal differences and rivalries with each other. His most remarkable achievement in this domain is the speeches on Smyrna, which he addressed to the Roman emperors Marcus Aurelius and Commodus after the city had been levelled by a disastrous earthquake in AD 177 or 178; these speeches actually moved the Roman authorities to contribute decisively to Smyrna's resurrection.

Some of Aristides' most elaborate works were probably never performed, but were disseminated in written form and

soon proved to be influential. In three long essays he intervened in an intellectual struggle of already long standing, that between rhetoric and philosophy, both of which claimed to be the most important subject of a higher education. Since Plato had carried out his formidable attacks on rhetoric in the *Gorgias*, that struggle had never ceased, and now Aristides came down emphatically on the side of rhetoric. A long double essay *On Rhetoric* proclaimed the pre-eminent worth of its subject against philosophy, and the equally long *In Defence of the Four* aimed to rehabilitate the achievements of the four great Athenian statesmen and generals Miltiades, Themistocles, Cimon, and Pericles, which had been ferociously taken apart in the *Gorgias*. Later on, the Neoplatonists took these attacks on their founding father seriously enough to react to them: in the latter part of the 3rd century AD Porphyry wrote *Against Aristides* in seven books, and in the 5th century Olympiodorus and Proclus still felt obliged to take note of Aristides' essays.

It was, however, in the field of rhetoric itself that Aristides proved most influential. He was one of the foremost exponents of literary Atticism in his age, and his efforts to make his style conform as much as possible to the way Attic authors had expressed themselves some 500 years earlier were astonishingly successful. He had no gift for extemporizing speeches (an ability that was very much sought after in his time), but rather preferred to polish his texts as meticulously as possible in his study. This may in fact have assured their survival; Aristides is one of the very few typical authors of the Second Sophistic whose work was preserved beyond the end of antiquity, and he even belongs to the small number of Greek writers whose works survive almost in their entirety. For centuries after his death (which probably occurred around AD 180) Aristides very nearly attained the goal he had so fervently pursued: to surpass Demosthenes. Already in the 3rd century AD the rhetorician Longinus regarded him as the defender of Atticism against the dissoluteness of so-called Asianic oratory (characterized by bombast and emotion); at about the same time the rhetorical treatises of Menander of Laodicea (who also wrote the first commentary on him) cite Aristides as often as Isocrates and Plato and considerably more frequently than Demosthenes and Lysias. In the 4th century AD Libanius and Himerius show his influence: Libanius wrote set pieces against declamations that Aristides had worked out (e.g. his *Embassy Speech to Achilles*) and the *Hieroi Logoi* provided inspiration for his autobiography, while Himerius' *Polemarchikos* drew on Aristides' *Panathenaikos*. At about the same time Sopater of Apamea provided an *Introduction* to Aristides' work and commentaries, which – together with the exegetical notes of other authors – later became a part of the extensive scholia (explanatory notes) that were added in the margins of the manuscripts.

After the dark centuries of early Byzantium we find Aristides holding an important place in higher education. Photios in his *Bibliotheca* (cod. 246–48) provided excerpts of the *Panathenaikos* and the long anti-Platonic speeches on rhetoric; in the 10th century archbishop Arethas ordered the writing of what today is the most important Aristides manuscript (A, Oxford, Bodleian Library, MS E.D. Clarke 39) and added notes to it. In the 11th century Theodora (daughter of the emperor Constantine VIII and later an empress herself) copied a text of Aristides in her own hand, and Michael Psellos commended studying him – besides such classics as Demosthenes, Isocrates, and others – as a necessary means for attaining mastery of style. The Palaiologan renaissance preserved Aristides' influence; two speeches *On Exemption from Public Burdens* (also called the "Leptinean orations") by Thomas Magistros (who also excerpted Aristides for his lexicon) even found their way into the Aristidean corpus. In the 14th century Theodore Metochites not only modelled his *Byzantios* on Aristides' encomium on Rome, but also wrote an essay comparing Aristides and Demosthenes, and in the 15th century the *Hieroi Logoi* still provided inspiration for John Chortasmenos's reports on his own sickness. The fall of Byzantium finally put an end to Aristides' long importance as a model for elaborate rhetorical writing.

HEINZ-GÜNTHER NESSELRATH

Biography

Born in AD 117 at Hadriani in Mysia, Aristides was educated in Athens and Pergamum and travelled widely (to Egypt, Cyzicus, and Rome) before settling at Smyrna. Chronic illness forced his (temporary) retirement and enabled him to pursue his rhetorical studies. He became a great exponent of literary Atticism for which he was much admired by posterity. He died *c.*180.

Aristocracy

Rule by the "best"

Aristocracy (*aristokratia*), a form of government based on the principle that the "best" should rule, is a compound of the Greek words for the best (*ariston*) and rule (*kratos*). Aristocracy may appear similar to rule by the rich (plutocracy), or by the few (oligarchy), or by honour (timocracy), but it is distinguished by the exercise of power by a hereditary minority, usually a relatively small landed class. Aristocrats claim to be the best because they are the possessors of some superiority by blood, lineage, rank, talent, virtue, or wisdom, which becomes a legitimizing principle. A variety of socio-political practices and political arguments have been used to justify the resulting privileges. Aristocracies develop traditions to set themselves apart from the common mass of people. By adopting distinctive styles of behaviour, dress, habits, speech, interests, education, and even sexual practices, aristocrats are marked as qualitatively different from ordinary people. These cultural distinctions are inculcated into all members of the aristocratic families. Aristocrats seek to maintain themselves by the principle of purity of blood so that only a noble may marry a noble. They usually maintain control of the principal sources of wealth, military training, and the institutions of religion. By means of these controls power can be held for generations. Aristocracies degenerate in several ways. Excessive inbreeding can eliminate the vigour needed to rule. Intermarriage with the *nouveaux riches*, or with powerful oligarchs, to renew ebbing fortunes violates the genetic principle and puts the aristocracy up for sale. Or they may simply fail to cope with changing times.

In Homer "the best" usually means the best warriors. By the Archaic period the Homeric military elite of merit had changed to a nobility of birth. When combined with the advantages that family traditions and wealth provide, aristocracy can produce those who are the apparent "natural leaders" of society. Greek aristocratic families claimed that descent from a heroic or mythical person set them apart from and above others in every generation. The aristocrats were the eupatrids, or those born to "good fathers".

In the 8th century BC when the Greek city states were emerging from the Dark Ages, the kings of earlier times had all but vanished, except at a few places such as Argos and Sparta. Elsewhere kings were replaced by or dominated by aristocrats. For the next few centuries the aristocrats ruled or dominated their respective city states, usually through a council (*boule*). Often the ruling class came from only one clan.

By the end of the 6th century BC socioeconomic and military changes brought challenges to aristocratic power. Growing population pressures and economic difficulties impoverished small farmers. Lenders, often aristocrats, sold indebted fellow citizens into slavery. These conditions and practices led to socioeconomic tensions which were aggravated by the revolutionary changes in warfare. In the heroic age aristocrats had been the most powerful warriors. Riding to battle on a horse or in a chariot, they often fought only their social equals. Now the hoplite, a heavily armed, middle-class soldier, fighting as part of a unit called a phalanx, became the core of the city state's army. The new middle class, who could afford the armour but not the horse, demanded a share of the political power. When the aristocrats refused to accept reforms, the ensuing conflict with the lower classes turned into class warfare.

In some cases of civil strife in the city states a disgruntled aristocrat would lead the people in revolt against the aristocracy. These "class traitors" eventually acquired the name *tyrannos* (tyrant). Cypselus became tyrant of Corinth after the aristocratic family, the Bacchiadae, were overthrown. The 5th century BC was virtually the age of tyrants in Greece, a time when the old aristocratic system was breaking down, to be replaced by oligarchies, or democracies. The civil strife ended in some city states, such as at Athens, with a democratic form of government. Elsewhere it produced oligarchies. In Sparta, however, the regime was successful in suppressing any democratic tendencies that threatened the prevailing aristocracy.

Athenian aristocratic families included the Alcmaeonidae, Philaedae, Eumolpidae, Phytalidae, Eteoboutadae, and Lycomidae. Individual Athenian aristocrats included Draco, Solon, Hippias, Cleisthenes, Pericles, and Alcibiades. Individual Spartan aristocrats included Lycurgus and Leonidas. The Presocratic philosopher Heraclitus of Ephesus was an aristocrat, as were many other philosophers, including Plato. The rise of democracy reduced the power of aristocrats, yet they often provided the leadership in many fields.

Plato in his *Republic* advocates rule by an aristocracy of intellect. Generally, aristocrats have avoided intellect as a criterion of membership in the aristocracy because there is no guarantee that remarkable aristocrats will have anything other than ordinary children. Aware of this, Plato rejected physical succession in his Utopia in favour of a system of recruitment that sought the best and brightest, even if born into the lower orders. Aristotle's theory of aristocracy, as developed in the *Politics*, has been used over the centuries to support aristocratic aspirations. He argues that aristocracy is the good form of rule by the few because they are the best from virtue, and that such a regime itself cultivates virtue in the city state.

In the Hellenistic age a few aristocratic families continued their traditions, but for the most part the Hellenistic kings ruled through bureaucracies, as did the Romans. By the time of the emperor Justinian (527–65) a system of military districts called "themes" arose. The theme system encouraged ownership by many small landholders who could easily serve as soldiers. By the reign of Basil II (976–1025) large landowners had emerged from the military aristocracy. Their efforts to create large estates led to civil war. Although they were defeated, they eventually took over from within, and emperors were drawn from aristocratic families. Consolidation of landownership ruined the theme system, which had been the source of military strength for the empire.

After the fall of Constantinople in 1453, moneyed aristocrats eventually emerged among the Greeks living in the Ottoman empire. Composed of Greek and Hellenized Albanian and Romanian families, they were called the Phanariots after the lighthouse quarter in Constantinople.

Aristophanes

Athenian comic dramatist of the 5th–4th centuries BC

Aristophanes composed 40 comedies, 11 of which have survived, the earliest of these being datable to 425 BC and the last to 388. In the course of the Classical period comedy underwent great changes in character and structure. Aristophanes is a representative of Old Comedy – its supreme representative, in the judgement of late antiquity, and therefore the only one whose works have survived.

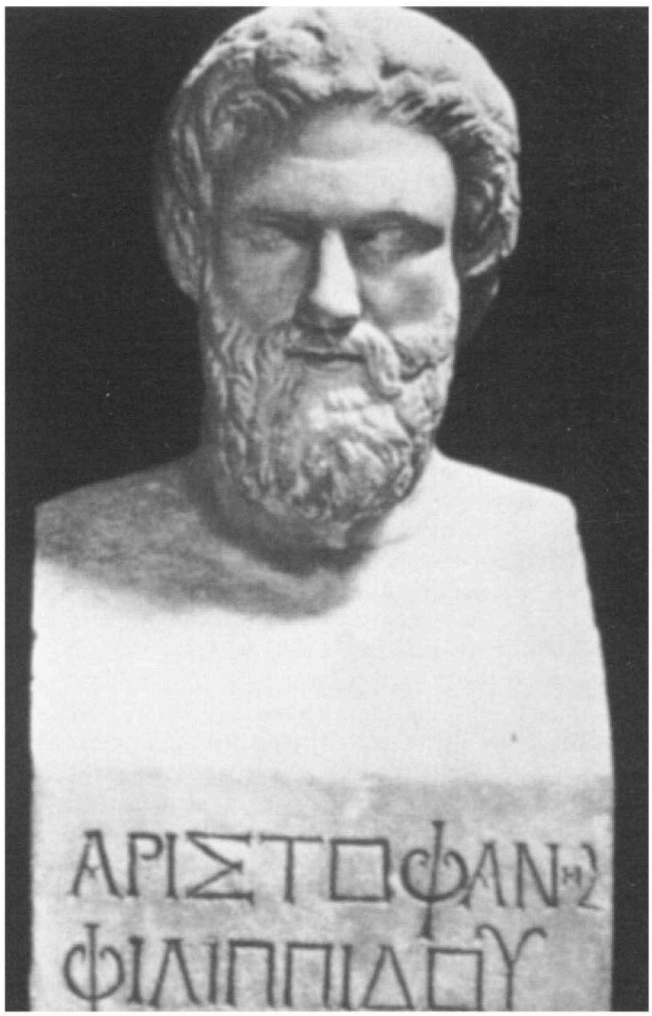
Nothing quite like Old Comedy exists in the modern theatre; it comprises elements of farce, but includes much that we associate with pantomime, situation comedy, savage political satire, and animated cartoons. Its dramatic time is always the present, and its topicality constitutes one of its essential differences from the universality of "New Comedy", which held the stage two generations after Aristophanes' death. The characters in some of his comedies were living people known to the audience, such as Euripides (in *Acharnians*) and Socrates (in *Clouds*). The plot sometimes turns upon an issue which was a real political issue at the time of performance.

By no means all Aristophanes' plays are political, and whether they are or not, the resolution of the plot entails unlimited fantasy. In *Birds*, for example, a plausible Athenian persuades the (Greek-speaking) birds to build a city in the sky and lay siege to the gods; and in *Frogs* the god Dionysus travels to the underworld and presides over a poetical contest between the ghosts of Aeschylus and Euripides. The operation of cause and effect in the world as we know it is suspended to whatever extent the poet wishes, and the audience is not expected to say "But how could...?" or "But surely...!" because consistency is readily sacrificed. In *Lysistrata*, for instance, an Athenian woman organizes the citizens' wives of the belligerent states to go on a sex strike until negotiations for peace are opened. The plot envisages that while the younger wives stay at home, tantalizing and frustrating their husbands, the older women occupy the Acropolis; but then we find that *all* the wives have shut themselves away on the Acropolis.

Whereas there is some evidence that some of Aristophanes' plays were performed in the Greek cities of southern Italy and Sicily for a while after his death, that seems not to have been the case in Athens, where popular taste in comedy changed rapidly and fundamentally. In the 3rd century BC, however, scholars were attracted to the reading and study (though not the performance) of Aristophanes, and successive commentaries on his texts were composed. By about AD 900, when interest in ancient pagan literature revived at Byzantium after a long lapse, manuscripts of 11 out of the original 40 plays could still be found, and within those 11 a canon of three took shape: *Wealth* (*Plutus*), *Clouds*, and *Frogs*. *Wealth*, far in the lead in respect of the number of medieval manuscripts which contain it, owed its popularity and educational utility to the universality of its theme – the "injustice" which everywhere rewards the dishonest and impoverishes the righteous – and to the consequent paucity of references which demand antiquarian knowledge. Its comparative avoidance of outright obscenity and of difficult passages in elaborate poetic language no doubt contributed to its high status.

Aristophanes became known to western European scholars in the 15th century; the first printed edition of his plays appeared in 1498, and many Latin translations followed (there was even an Italian translation in 1545). When an individual play appeared in a modern language, it was usually *Wealth*, for the Byzantine evaluation, inherited by the Renaissance, prevailed for nearly three centuries. After the beginning of the 19th century school editions of all the plays, together with translations for the educated public, proliferated. The editions were often ruthlessly bowdlerized by excision, which obscured the point of jokes, as did evasive paraphrase in translations.

According to an ancient anecdote, Plato told the Syracusan tyrant Dionysius that for a proper understanding of Athenian democracy a thorough reading of Aristophanes was essential. That advice was not taken (and probably not known) by the protagonists of the Hellenic cultural revival which from small beginnings in the 17th century increasingly came to engage Greek intellectuals at the end of the 18th century. While school pupils in the west were becoming well acquainted with Aristophanes, he had no place in the 30 volumes of Korais' *Hellenic Library*, and first found a modern Greek editor (Neophytos Doukas) in 1845. Doukas, rather like the Byzantine scholars, valued Aristophanes above all as an exponent of the Classical Attic language, whereas Korais and other participants in the Greek revival were aiming at moral and intellectual regeneration, an end to which a poet so often frivolous, cynical, and obscene did not seem to make a contribution of value. Within living memory, students at Greek universities heard no lectures on Aristophanes. There exists, however, in Greece a long and rich tradition of obscene, satirical, anti-establishment popular song, together (in some regions) with touring market-square comic performances, and it is noteworthy that the first translations of Aristophanes into demotic Greek (by Rangavis) coincided with the introduction in 1860 of shadow-plays whose stock characters always included an ingenious and imaginative rogue of Aristophanic type (karaghiozis). During the last 50 years performances of



Aristophanes, son of Philippos, father of Greek comedy

Aristophanes in demotic translation have come to be one of the most striking achievements of the modern Greek theatre.

In a typical Aristophanic play a substantial part is played by a chorus, sometimes representing animals, birds, insects, or personified abstractions. That is a tradition which Aristophanes inherited, for a vase painting dating from long before his time depicts men dressed as birds dancing in line. The chorus of *Wasps*, pitiless old jurymen, is a metaphor realized in the flesh. Except in his last two plays, *Women in the Assembly* (*Ecclesiazusae*) and *Wealth*, where we see the start of the process which soon led to the limitation of the chorus's role to song-and-dance intermezzi for which the poet did not write the songs himself, the chorus at a central point in the play steps wholly, partly, or minimally out of its role in the plot and addresses the audience directly. It may speak for the poet, as "he" or (as part of the time in *Clouds*) "I", denigrating the poets who were his rivals for prizes at dramatic festivals; it may criticize, often with a light and humorous touch, political behaviour of the citizen body; or it may (as in *Birds*) exploit with jocular imagination ideas which emerge from the plot of the play. This direct address to the audience, usually preceded and followed by lyric hymns addressed to deities, is the "parabasis" of the play, and it raises the question: when it seems to us to be serious, is it really serious?

On one occasion at least it is hard to avoid saying "yes". In *Frogs* the parabasis urges the restoration of citizen rights to the men who had been disfranchised for their involvement in an oligarchic revolt six years earlier. That was a practicable step (even if unwise), and a step actually taken some months later after disastrous defeat at sea. But it is not just in the parabasis that the question arises; it is raised also by the purposes which the "hero" of the play (there is not always one) realizes triumphantly. We can be certain that the audience of *Acharnians* contained some people who shared the view that going to war against Sparta had been a mistake and that there was now an opportunity to stop it, because we know that not everyone had favoured war at the start and that in its second year, under the impact of the plague, the assembly had seriously contemplated negotiation for peace. It is wrong, though, to think of Aristophanes as a pacifist in the modern sense; between the belief that killing is always a sin and the recognition that there are times when peace is more advantageous there is a considerable gap. Perhaps, diffidently, he was a feminist, who in *Lysistrata* and *Women at the Thesmophoria* gives a powerful voice to the dissatisfactions of women, though to his audience the idea that women (or sheep, or sharks) could organize themselves like men would have been intrinsically funny, and *Women in the Assembly* treats women as preoccupied with food, drink, and sex.

While his parodies of tragedy can be acquitted of malice, his uninhibited attacks on named individuals can hardly be dismissed as harmless fun, seeing that at the end of *Clouds* Socrates and his disciples, driven out of the school by fire and pelted with stones, suffer the fate of traitors whose crimes were judged so monstrous as to deprive them of the law's protection. Plato blamed Aristophanes for creating popular prejudice against Socrates; and there were a few critical occasions on which vilification of named individuals on the comic stage was temporarily forbidden by law. Perhaps humorous periodicals which are frequently sued for libel are the nearest modern equivalent to Aristophanes.

Biography

Born probably in the 450s BC, Aristophanes was the greatest exponent of Old Attic Comedy but little is known of his life. Of 40 plays written by him, 11 have survived, ranging in date from 425 to 388 BC. They are now popular on the modern Greek stage. Aristophanes died *c.*386 BC.

Aristotelianism

It is not possible to understand "Aristotelianism" properly without understanding the complex reception of Aristotle's works. It is true that there are concepts one immediately associates with Aristotle's teachings – the four causes, the doctrine of the mean, and the like – but Aristotle meant many things to many readers over time. As is well known, Aristotle's writings were not in circulation for more than two centuries after his death. It is not entirely clear who was responsible for recovering them, but copies of his works were evidently available in Rome in the 1st century BC. Aristotle's ideas had little detectable influence, however, except in the fields of rhetoric and cosmology. It was not until the 3rd and 4th centuries AD that Aristotle was the subject of lectures and commentary activity in the schools of philosophy at Alexandria and Athens, notably by the Neoplatonists, Porphyry and Alexander of Aphrodisias, both of whom concentrated mainly on the works comprising the *Organon*. Porphyry's *Eisagoge* (Introduction) to Aristotle's *Categories* was enormously influential through the Greek and, later, the Latin Middle Ages, as was Alexander's commentary on the *Topics*. These Alexandrian and Athenian exegetes, however, were concerned above all to reconcile Aristotle with Plato, on the assumption that in the works of both one could find the truths of philosophy, but expressed differently. By comparison with Plato, they found Aristotle notoriously obscure – intentionally, these commentators explain. In the 6th century significant commentary activity was carried on by John Philoponus and Simplicius, both students of the Neoplatonist Ammonius Hermeiou in Alexandria. In Ravenna, then the capital of the western Roman empire, Boethius produced a translation of the *Topics* into Latin and commentaries (now lost) on the *Analytics*. The Boethian version of the *Topics*, along with his *De Differentiis Topicis*, formed the core of the "Old Logic" that was to persist well into the Latin Middle Ages.

As early as the 4th century Aristotle was being translated in Edessa into Syriac. These Syriac versions formed the base for translations into Judaeo-Arabic and, in 10th-century Baghdad, into Arabic. These aroused keen interest among Muslim scholars both in Baghdad and, in the two succeeding centuries, in Moorish Spain. Among the most influential of those scholars were al-Farabi (d. 950), Ibn Sina (Avicenna) (d. 1137), and Ibn Rushd (Averroes) (d. 1198), all of whom produced editions, with commentaries (often collating Greek manuscripts checked against the Syriac), of Aristotle's major works with the exception of the *Politics*, the *Eudemian Ethics*, and the *Magna Moralia*. Like their Greek Neoplatonist predecessors, whose prolegomena and commentaries they also translated and studied, Arabic exegetes understood Aristotle as the author of a closed system and supposed him to be in complete agreement with Plato.

Aristotelianism in the Middle Ages must, of course, be differentiated, for there were two separate traditions, the Byzantine and that of the Latin west. In Byzantium Aristotle was looked upon with some suspicion, as a pagan thinker who believed, for instance, that matter was eternal and that, if there is a divinity, it is physically represented by the ether that fills the void in the universe. In the 9th and 10th centuries there was a surge in interest in Aristotle and the production of some important manuscripts of his works – some of them possibly obtained from libraries in Baghdad and Basra. By far the most widely circulated were the books that make up the *Organon*, with the treatises on natural history running a distant second. In the 11th century Michael Psellos and his student John Italos lectured on Aristotle, mainly on dialectic. One of Italos's students, Eustratios, composed a commentary on book 6 of the *Nicomachean Ethics*. Italos and Eustratios, however, found it hard to stay safe from persecution, as Italos was twice condemned by Orthodox theologians and Eustratios, in 1117, was condemned for, among other things, claiming that Christ reasoned in Aristotelian syllogisms. In the decades that followed, members of a scholarly circle sponsored by the secluded Anna Komnene, chiefly Michael of Ephesus and Stephanos Skylitzes, produced commentaries on many of Aristotle's works for which there was no commentary tradition in Greek. One of the commentaries that may have come out of the activity sponsored by Anna is that on *Nicomachean Ethics* 6 by Eustratios, which begins with a dedication praising her piety and learning and addressed to a young reader by an old writer. Eustratios also composed a commentary on *Nicomachean Ethics* 1, one on book 2 of the *Posterior Analytics*, and a short piece based on Aristotle's *Meteorology*. Michael of Ephesus produced a much larger number of works than did Eustratios. It is generally agreed that he composed scholia and/or commentaries on *Nicomachean Ethics* 5, 9, and 10; the *Parva Naturalia*, the biological treatises; *Metaphysics* E–N; *The Generation of Animals*; *Topics* (lost); *Physics* (lost);

De Interpretatione (lost); *Prior Analytics*, book 2; *Sophistic Refutations*; and the *Rhetoric*. Even allowing for the fact that Michael obviously depended on earlier commentaries on these works, his output was nothing short of amazing – the extant material alone filling more than 1100 printed pages. At the end of the 13th and during the 14th century, there was another "renaissance" of interest in Aristotle in the synoptic works of Nikephoros Blemmydes (d. 1272), who composed epitomes of both the *Organon* and the *Physics*. Even in the 14th century writers such as Theodore Metochites complained about the "labyrinthine" obscurity of Aristotle's style. Aristotle's philosophy, on the whole, never played an important part in Byzantine thinking.

In the Latin west, Aristotle arrived in the mid-13th century via Latin translations by Gerard of Cremona and William of Moerbeke of Arabic versions of his works. His influence, channelled partly through the commentaries of Ibn Rushd and Maimonides, was enormous on the works of Aquinas and such thinkers as Siger de Brabant. In spite of the strenuous opposition of the Catholic hierarchy, Aristotle made significant inroads into medieval thinking. Indeed, he was universally known as "The Philosopher". This was, once again, primarily in the field of logic; but his influence is also apparent in discussions on the nature of an "art" and a "science", in the need to discuss all subjects in terms of the four causes, and in the fact that Aristotelian (Latin) technical vocabulary became the virtual lingua franca of all the disciplines, not least theology. Theological discussions were controlled by Aristotelian principles of valid deduction to such a degree that Byzantine theologians had difficulty both in following and in countering western arguments in their encounters in the 14th and 15th centuries. As a consequence, Gennadios Scholarios produced translations into Greek of parts of Aquinas' *Summa contra Gentiles* and his *De Ente et Essentia*, the *Summulae Logicales* of Peter of Spain, and the commentary on Aristotle's *Categories* by Gilbert de la Porrée.

During the 15th and 16th centuries in Europe there was a huge growth in interest in Aristotle's works. This was due in part to the proliferation of printing presses after 1470 or so and the consequent publication, by 1600, of over 3000 editions of *Aristotelica*. With the fall of Constantinople to the Turks in 1453, large numbers of codices containing the works of Aristotle and his Greek commentators arrived in the west as did a number of Greek scholars who brought instruction in Greek to western universities. These were critical factors in the Renaissance recovery of Aristotle, and although Byzantine teachers had been active in Italy well before 1453, the second half of the 15th century witnessed activity of a different order. Scholars such as Demetrios Chalkondyles and Leonikos Thomaios lectured on Aristotle at the University of Padua, where a chair of Greek letters was established in 1463. In 1497 a chair of Aristotelian philosophy was established at Padua, where Aristotle's works were read by students in virtually every discipline, including medicine. In 1542 a chair of Greek and Latin philosophy was established at the Collège Royal, and Francesco Vimercato was invited from Milan to lecture on Aristotle's *De Anima*. The first printed edition of the Greek text of Aristotle's works (minus the *Rhetoric*) had been published by Aldus Manutius in Venice in 1498. This enormous project could not have been realized without the assistance of the indefatigable Markos Moussouros, who himself was responsible for the publication of Alexander of Aphrodisias's *Commentary on the Topics* (1514) – highly influential on Renaissance study of Aristotle.

The University of Padua became perhaps the most influential centre of Aristotle studies in Europe at a time when there was enormous interest in Aristotle. (As the eminent scholar Charles Lohr has observed, there was more commentary activity during this period than in the whole millennium between Boethius and Pietro Pomponazzi.) At Padua Aristotle was combined with Scholastic methods and principles to produce a kind of neo-Aristotelianism that was to inspire a new enthusiasm for philosophy. Greek scholars such as Michael Sophianos and Daniel Fourlanos joined with Jacopo Zabarella (d. 1589) in lecturing on Aristotle's *Poetics*, the *De Anima*, and the *Parts of Animals*; and Fourlanos produced Latin versions of *Parts* and of *De Anima* in 1574. That same year Maximos Margounios (1549–1602) published a Latin translation of Psellos on book 2 of the *Posterior Analytics*.

The following generation of Aristotle scholars at Padua included such teachers as Joannes Kottounios (1577–1658), a Macedonian from Ohrid who would succeed the famous Cesare Cremonini as professor of philosophy – chiefly Aristotle's works on natural philosophy. In his lectures on Aristotle's *De Caelo* and *Meteorologia* Kottounios sided with Cremonini, who had become famous as the man who would not look through Galileo's telescope. Unlike his "Aristotelian" predecessor Zabarella, Cremonini had little use for direct observation – which should remind us of the important fact that Renaissance "Aristotelians" were extremely eclectic. Some Renaissance "Aristotelians" took up Aristotle's logic without paying attention to anything else; others adopted his moral philosophy without the natural philosophy; some revered his natural philosophy without his *Metaphysics*; and some, indeed, continued to read Aristotle in Neoplatonic fashion, looking for traces of the *prisca scientia* contained in the works of writers like Hermes Trismegistos.

In 1613 another of Cremonini's students, Theophilos Corydalleus, (1570–1646) successfully completed disputations on medical questions as well as on Aristorte's *De Anima* and the question of how odours are perceived according to the *Physics* , and was granted a double doctorate in medicine and philosophy. Corydalleus, who would be an important influence on Greek education until the end of the 18th century, spent the rest of his life propagating the Paduan version of Aristotle throughout the Balkans, spending time teaching in Cephalonia, Zakynthos, his native Athens, and Constantinople. At Constantinople in 1625 he was appointed dragoman of the Patriarchate and *didaskalos* in the Patriarchal Academy, which he promptly reorganized along "Italian" lines. Three years later he would depart for Zakynthos to teach there again; but he returned to Constantinople in 1636. Corydalleus wrote extensively on various Aristotelian treatises, but only his *Rhetoric*, a synthesis of Aristotle and the still dominant Ciceronian doctrine, was published in his lifetime – in London, by Nikodemos Metaxas, in 1625. All of the rest exist only in manuscripts, the sheer number and distribution of which make it clear how pervasive his influence was. These include commentaries on the *Metaphysics*, *De Anima*, and *De Caelo*; notes on the *Physics* and *On Generation and Corruption*; and

his *Commentary and Questions Concerning Aristotle's Logic as a Whole*. These were used in schools in the Ionian islands, Bucharest, Jassy, and Constantinople well into the 18th century, towards the end of which printed editions of some began to appear. It is notable that Corydalleus wrote his treatises in Attic Greek, possibly because modern Greek had not yet stabilized, but certainly because he thought it best to write about Aristotle in Aristotle's language.

The generation after Corydalleus saw continued interest in Aristotle's works, most notably, perhaps, in the activities of the Phanariot Alexander Mavrokordatos (1641–1709). Mavrokordatos had been educated in Rome, Padua, and Bologna, where he studied medicine. Mavrokordatos eventually went to Constantinople, where he taught at the Patriarchal Academy, and later (in 1673) was appointed to the office of Grand Dragoman by the Sublime Porte. Amid all his various duties, he found time to write a number of books on a wide range of subjects, including a commentary on and synopsis of Aristotle's *Rhetoric*. One of Mavrokordatos's students, Sebastos Kyminitis, is recorded as having lectured on *On Vices and Virtues* at the Greek Academy in Bucharest in 1689.

Interest in Aristotle's philosophy was beginning to wane, however, among teachers of philosophy, many of whom were educated in Italy and Germany and were consequently (and increasingly) drawn to the "new" philosophy as propounded by the likes of Descartes, Leibniz, and Locke. Thus, on the one hand, George Sougdouris taught Aristotelian logic and poetics in the Corydalleus tradition in Ioannina between 1682 and 1715; but on the other, his student, Methodios Anthrakistes (b. *c.*1662), was condemned by a patriarchal synod in 1723 for not adhering to the Peripatetic school. This action represents a major readjustment within the Orthodox Church (recall Eustratios), which in reaction to the new philosophies of the west had adopted the Paduan version of Aristotle as its philosophical framework.

Padua continued to be a centre for Aristotle studies well into the 18th century. Some traditional branches of philosophy – chiefly physics – no longer looked to Aristotle's teachings, but ethics, metaphysics, logic, and rhetoric at Padua retained a strongly Aristotelian character. This was particularly evident in the teaching and writing of Vikentios Damodos (1700–52). Damodos was yet another Greek who studied in Italy, but returned to his homeland to teach. Born in Cephalonia, he studied first at the Flanginian Academy, founded in 1626 and sponsored by the metropolitan of Venice, and then went to Padua, where he took a double *Juris Doctor* degree in 1721. He returned shortly after to Cephalonia, first to practise law, but before long to teach in his native village, Chavriata. He wrote on a large number of subjects, most often from an Aristotelian standpoint, as in his *Metaphysics*, a synopsis of the *Nicomachean Ethics*, an *Epitome of Aristotelian Logic*, and two treatises on rhetoric strongly influenced by Aristotle's *Rhetoric*. None of his works was published in his lifetime, although his *Epitome of Aristotelian Logic* and his *Art of Rhetoric* were well enough known to be published in Venice in 1759.

At this juncture, evidence for interest in Aristotle becomes thin and widely dispersed. Such interest seems to have narrowed to his logical works and, to a somewhat lesser degree, to the *Ethics*. Thus, for instance, the *Introduction to Aristotle's Logic* by Georgios Sougdouris (d. 1740) came out in a 1792 edition in Venice. Manasse Eliades (d. 1785), who did not consider himself an Aristotelian, lectured on the *Categories* at the Academy in Bucharest. Neophytos Kavsokalyvytis (d. 1780) produced scholia on the *Ethics* for his students in Chios. In general, however, Greek philosophers were more interested in translating into Greek such authors as Malebranche and Condillac than in continuing the Aristotelian tradition. Occasionally Aristotle was pressed into service for arguments about other matters. Adamantios Korais, for instance, produced in his Hellenic Library editions of the *Politics* (1822) and the *Ethics* (1825), suggesting in the prefaces to those editions that they might be of assistance in constitutional decisions that had to be made after the War of Independence. That suggestion, it seems, foreshadowed similar determinations in England and Germany 20 years later, during the years of political liberalization, when there was a similar ripple of interest in Aristotle. Since then, it is fair to say, interest in Aristotle has been limited largely to philological circles in Greece, as it has been in the countries of western Europe.

Aristotle 384–322 BC

Philosopher

Aristotle was born at Stagira in Chalcidice; his father, Nicomachus, was court physician to the Macedonian king Amyntas III. At the age of 17 he went to Athens to study at Plato's Academy, remaining a member for 20 years (first as a student and later as a teacher). Shortly after Plato's death in 347 BC, he left Athens for the court of Hermias at Atarneus in Asia Minor. He lived for two years on the island of Lesbos, where he engaged in some zoological researches and met Theophrastus, who was to become his student. In 343 BC he went to the court of the Macedonian king Philip II at Pella and there served as tutor to Philip's son, Alexander. In 335 BC, when Athens had come under Macedonian rule, Aristotle returned and founded his own school, in the Lyceum (a sanctuary located outside the eastern section of the ancient wall). There was a *peripatos* – a colonnaded walk – in the building, from which the school acquired its name – the Peripatetic

school. On the death of Alexander in 323 BC there was an eruption of anti-Macedonian sentiment in Athens, and Aristotle himself was charged with impiety. He fled and came to reside on a family estate at Chalcis on the island of Euboea. One report has him stating that he fled "so that Athens might not commit another crime against philosophy" (in 399 BC Socrates had been charged with impiety, found guilty, and sentenced to death.) He died at Chalcis a year later, perhaps of a stomach ailment.

Aristotle was a student of Plato, but his own writings clearly show that he was by no means a Platonist. (Some of his early works, of which only a few fragments survive, contain Platonist elements, but these may have been propagandist writings for the Academy.) Plato's grand theory was that of the Forms. He held that certain unitary, unchanging, and perfect realities exist in a realm beyond perception. Among these realities are the Good Itself and the Beautiful Itself. The theory of the Forms has both ontological and epistemological aspects. The Forms are basic realities and so the existence of all other things (within our own changeable and imperfect realm of perception) is dependent upon them. Further knowledge, for Plato, is a cognitive grasp of the Forms. Knowledge is gained, not through a process of justification (in which experience or belief is built up into knowledge through argument or investigation), but through a process of discovery. To come to know the Forms is to turn the mind's eye towards these self-justifying realities.

Aristotle explicitly rejects the theory of the Forms. His ontology and epistemology are profoundly anti-Platonist. For Aristotle, individual substances – such as "this man here" and "this horse here" – are ontologically basic. (It has been suggested that Aristotle's emphasis on biological individuals, in contrast to Plato's emphasis on quasi-mathematical individuals – the Forms – is due to the influence of the profession of Aristotle's father.) All else is dependent upon these primary substances: particular quantities and qualities would not exist if primary substances did not exist. Further, the universals that range above individual substances – universals such as man, horse, and animal – are substances only in a derivative sense. These indicate the character of a plurality of primary substances, but they do not exist as unitary basic realities. Thus, Aristotle reverses the Platonic model: he takes what is changeable to be ontologically basic and he denies that universals are substantial unities.

Scientific knowledge, according to Aristotle, is a cognitive grasp of the cause of a thing together with an understanding that the cause could not be otherwise. Aristotle thought of the sciences as axiomatic deductive systems. (Here Plato's fascination with mathematics may have been of some influence.) According to his view, one has scientific knowledge when one can demonstrate the cause of a thing from first principles. These first principles are better known and prior to the conclusion of a scientific demonstration. Thus, for Aristotle, knowledge of, say, why snakes have a larynx but no epiglottis is akin to knowledge of why two triangles with the same base and height are equal in area. In each case, knowledge is secured through demonstration from the first principles of the relevant science. First principles, however, cannot be demonstrated. These must be grasped by some other means. Aristotle holds that our perceptual experience provides the ultimate justification of first principles. Our nature is such that we store perceptions within the soul. Owing to memory we come to have experience (a grasp of concepts based on particulars) and owing to experience we come to entertain the principles of science (concepts involving the grasp of strict universals). For example, Aristotle asserts that it is from perceptual experience that we grasp the truth that an eclipse is a certain loss of light on the moon. This, however, is not knowledge of the cause of an eclipse. Knowledge of the cause – obstruction of the sun's light by the Earth – is secured through a process of inference to the best explanation. Other candidate explanations (say, rotation of the moon) fail the test of perceptual experience (our familiarity with the precise pattern of loss of light on the moon during an eclipse suggests that the rotation of the moon is not a suitable explanation). Reason tests candidate explanations against our perceptual experience and so it is this experience that provides the ultimate justification of first principles. Aristotle's empiricism, thus, lies in stark contrast to Plato's rationalism.

Aristotle was the first philosopher to develop a theory of formal logic. His theory of deductive inference is that of the categorical syllogism. By first establishing the validity of four "perfect" (axiomatic) syllogistic forms, he was able to show which remaining standard syllogistic forms are valid. (Out of 256 standard syllogistic forms, only 24 are valid.) Aristotelian logic was for two millennia treated as the whole of logic. The logical writings constitute a singular and unparalleled achievement and Aristotle was himself aware of this. In a rare self-congratulatory passage he lauds his own achievements in logic as being entirely without precedent among Greek philosophers.

In areas where his predecessors had expounded theories, Aristotle would often begin his own studies by setting out, analysing, and comparing their views. He would then explore what is common among such theories, mark differences, and locate areas in which such theories stand at odds (with one another, with the perceived phenomena, or within themselves). He would then guide his own positive investigation in the light of the results of this inquiry. In such inquiries Aristotle sought to preserve what is true in earlier theories and to understand better the difficulties within a given field. (He claimed that it is impossible for one to untie a knot that one does not know.) Inquiry of this sort occupies the philosophical branch of Aristotle's dialectical method, a method of arguing from the opinions of others.

Dialectical inquiry is most evident in the works on natural science. In these works, among other things, Aristotle sets out and studies the theories of the Presocratic philosophers. We owe practically all that we know of the Presocratics to Aristotle; for a majority of the extant fragments come from his own writings, the writings of his student Theophrastus, and the writings of his Greek commentators (such as Simplicius). Within the works on natural science we find many of the distinctive conceptual advances that mark Aristotle's thought as superior to that of his predecessors. One such advance can be found in his treatment of causality. While many of the Presocratic philosophers had attempted to account for natural phenomena through an analysis of matter, Aristotle argues that a complete treatment of such phenomena must take into account not only material causes, but formal, final, and effi-

cient ones as well. Just as a complete account of a sculpture will make reference to its matter (bronze), its form (shape or organization), its efficient cause (the sculptor who initiated the shaping of the bronze), and the purpose for which it was made, a complete account of the genesis of a living thing, or of the organic functioning of a living thing, will make reference to four causes.

Aristotle utilizes the doctrine of the four causes within both his psychological and his biological works. In his main psychological work, the *De Anima*, he argues that soul is not a body, and yet it is also not an immaterial substance that might exist in separation from the body. Soul is the form of the living body: it is the organization-for-the-sake-of-functioning of the living thing. This theory – hylomorphism – avoids the pitfalls of both elemental materialism (which fails to give an account of purposes or goals in nature) and Platonic dualism (which, when conjoined with the doctrine of the transmigration of soul, fails to give an account of how different kinds of bodies might prove to be suitable hosts for some one kind of soul). The theory of hylomorphism is, perhaps, compromised within Aristotle's account of intellect. He suggests that intellect may be separable from the body. (This move towards dualism is, perhaps, an anomaly within his writings, an anomaly that may betray a Platonist influence.)

The doctrine of the four causes shapes Aristotle's biological investigations. (The writings on biology take up more than one-fourth of the extant corpus.) His view of nature is teleological. Thus, taking the fully developed and flourishing member of the species to be the end towards which the species itself aims, he holds that the biologist must focus his studies on healthy mature adults within a given species. The variety and depth of Aristotle's investigations into the anatomy, development, and habits of animals are dazzling. While a summary of his work in zoology cannot be attempted here, it should be noted that even into the 19th century naturalists were (re)discovering certain anatomical features of species that Aristotle had already noted in his own researches.

The central concept of Aristotle's ethics is flourishing (*eudaimonia*). The concept is also central to his political writings, for he asserts that the main function of government is to promote *eudaimonia* among its citizens. He thinks that, since humans differ from other animals in so far as they are rational, flourishing for a human must be living a certain life of active reason. We are rational, however, in two ways: part of us exercises reason and part of us is obedient to reason. Out of this distinction – a distinction between intellect and passion – Aristotle generates a theory of human excellence that treats both rational excellence and moral excellence. The moral excellences (such as courage and temperance) are means between extremes. To be temperate, for example, is to have an intermediate disposition in respect to bodily pleasures. These excellences are acquired through habituation. One becomes courageous, for example, by doing courageous things (even if at first one does not do courageous things courageously). The intellectual excellences (such as wisdom and prudence) are not means between extremes. These excellences are not acquired through habituation, rather they are taught. In his discussion of the best life, Aristotle places special emphasis on the intellectual activity of contemplation. He maintains that the life of contemplation is the best life: it is the best life in so far as it involves the activity of some divine element within us.

Aristotle's conception of God is linked to his cosmological theory. He holds that the earth is the centre of a finite spherical cosmos and that the heavens are constituted by a set of nesting concentric spheres that move eternally in perfect circles. The motion of the spheres has a first cause. This cause is an unmoved mover: it is an immaterial god. The unmoved mover (the highest sort of being) engages eternally in thought (the highest sort of activity). It is not the generative cause of the cosmos. Rather, it lives an exalted life of contemplation. The unmoved mover is eternally self-thinking thought.

After Aristotle's death Theophrastus became the second head of the Peripatetic school. Under his leadership the school thrived. He was a talented empirical scientist and a vigorous thinker intensely interested in the study of Aristotle's works. After his death the Peripatetic school fell into decline. His successors were either highly specialized thinkers (like Strato) or markedly unoriginal thinkers (like Lyco). It is probable that the Peripatetic school in Athens did not survive into the 1st century BC. Aristotle's thought, however, did not perish in the Lyceum. A considerable number of his writings have survived. In the 1st century BC Andronicus of Rhodes produced an edition of Aristotle's works and from the time of this edition there has been a continuous history of the transmission of Aristotle's texts within the Greek tradition. (The corpus as we now have it contains, perhaps, one third of what Aristotle had written.) Texts survived, but in addition Aristotle's thought did not go the way of dead dogma: his works were studied in the Neoplatonic schools of Athens, Constantinople, and Alexandria. Some of his doctrines found their way into Neoplatonism itself. (For example, the doctrine of the unmoved mover as self-thinking thought clearly reemerges in the writings of Plotinus.) These schools established a tradition of writing commentaries on Aristotle's works and in so doing they secured his legacy within Hellenic culture.

Aristoxenus

Writer on music in the 4th century BC

Born around 370 BC in Taras (Latin Tarentum; modern Taranto), Aristoxenus grew up when this town was ruled by Archytas the Pythagorean. His first instructor was his father Mnesias, a musician, and it is by this title, *musicus*, that Aristoxenus was persistently called, although in his case this term must be understood to refer primarily to his theoretical writings on music rather than to the skill he had in singing and in playing instruments. (That he had such abilities is demonstrated by his basing his theory of harmonics on aesthetic principles at variance with the purely mathematical views of more orthodox Pythagoreans.) His later teachers included the obscure Lampros of Erythrae (perhaps while still in Taras), then the Pythagorean Xenophilus, and finally Aristotle. His reputation in the Lyceum was such that he expected to be head of the school after Aristotle's death. That the headship fell instead to Theophrastus, whose interests were as wide-ranging as Aristotle's (including some technical works on music), should have come as no surprise.

Aristoxenus, for all his 453 books (as tallied by the *Suda*) on various philosophical, biographical, and historical topics, seems to have concentrated his best efforts on music. Indeed, we now know very little of his straightforward philosophical works, not even how large a proportion of the whole they formed. His comments on the nature of the soul owe little if anything to Aristotle's *De Anima* but have more to do with Pythagorean ideas of harmony in the soul such as are found in Plato's *Phaedo* and *Timaeus*. Since our sources (chiefly Cicero and Lactantius) associate these ideas with musical harmony, Aristoxenus may well have introduced them in his musical writings rather than in a separate work on the nature of the soul. Some sources refer to his *Hypomnemata* (Memorabilia), but this is a catch-all title that says nothing about the work's subject matter; other sources add the word *Miscellaneous* to the title. Here too Aristoxenus is said to have discussed musical matters, although perhaps not as technically as in his treatises devoted to the subject. Even his biographies may have been chosen because of his interest in music. This is obviously so in the case of his comprehensive work entitled *On Tragic Poets* and a separate life of Telestes the dithyrambic poet but, even in his biographies of Plato, Socrates, Archytas, and, of course, Pythagoras, he would have had much to say about their views of music as well as more usual matters, such as Socrates' two wives and Plato's travels. The quality of his biographical writings was praised by none other than the master of the genre, Plutarch, comparing the great and unalloyed pleasure they provide to that obtained by reading Herodotus or Homer.

We also hear of works entitled *Rules of Education* (in at least ten books), *Political Laws* (in at least eight books), *Mantinean Character*, and (if different from the last) *Praise of Mantineans*. Most of these fragments have nothing to do with music: they discuss the difference between two words having to do with shame, the fact that one educates one's son best by making him a citizen of a well-governed city, that Lycurgus died in Crete; but even here (in *Political Laws*), Aristoxenus has something to say about the composition of pseudo-Epicharmic verses by Chrysogonus the *aulos* player.

Aristoxenus truly deserves his title of *musicus*, then. In addition to some of the pertinent works named above, we hear of and learn a little about the following: *On Music*, *Course on Music* (these may be two titles for the same work), *On Music in Lyric Poetry*, and *Praxidamantea* (presumably on the views of the musical theorist Praxidamas). Significant portions, however, are extant of works entitled *Elementa Rhythmica* and *Elementa Harmonica* (in three books), although the latter seems rather to be selections from two distinct works. These actual words of Aristoxenus can be further supplemented by passages in later writers who drew freely from Aristoxenus: Porphyry, Michael Psellos, and two anonymous works.

Much of these two works is concerned with the technical details of notes, tempi, modes, scales, intervals, etc., but it is plain that Aristoxenus considered himself to be an innovator in the writing of musical theory. Arguing against those who, although ignorant of the true nature of music, nonetheless denied it any significance, Aristoxenus also distinguished himself from the extreme intellectualism of the Pythagoreans (see above), although he accepted some of their views on the

relationship between music and ethical behaviour. He could not, however, bind himself to a rigidly mathematical scheme that failed to take into account the slight but inherent disparities that are as much a part of music as (his example) the deviations from straight lines that woodworkers and other craftsmen in visual arts incorporate into their products. These deviations can be perceived, and then described, only by someone skilled in music.

Later writers on music theory made frequent reference to the theories expounded by Aristoxenus (even when they do not name him), some going so far as to ally themselves specifically with him in opposition to Pythagorean views.

Biography

Born *c.*370 BC in Taras (now Taranto) the son of a musician, Aristoxenus was taught first by his father, then by Lampros of Erythrae. Probably in Athens he was a pupil of Xenophilus and then joined Aristotle's Lyceum. He wrote copiously – 453 books according to the *Suda* – and mostly on music. He failed to succeed Aristotle as head of the Lyceum. His date of death is unknown.

Armatoloi

Licensed militias

Literally "men at arms", the *armatoloi* (singular *armatolos*) made up the quasi-official local militias that patrolled the numerous mountain passes of the northern mainland of Greece from the Byzantine period onwards. They were particularly dominant from the 15th to the 18th centuries, and were also present throughout the mountainous Balkan territories of the Ottoman empire, in Albania, Bosnia, Bulgaria, and Macedonia. During the Ottoman period, Balkan territories were divided into administrative subdistricts known as *armatoliks*, each of which had appended to it an *armatoloi* militia.

In addition to preventing brigand activity, the *armatoloi* were in some instances responsible also for rounding up enemies of the Ottoman government, guarding strategically critical areas, and serving as bodyguards for visiting travellers. For performing these functions, the *armatoloi* were paid by the local populations of the areas in which they served (in the form of a fee charged by the Ottoman government), and in some instances enjoyed also the revenue gathered in the form of tolls or passage taxes charged to those passing through the mountains or over the bridges which they often guarded.

Initially established as part of the administrative structure of the Byzantine empire, these militias were subsequently adopted by both the Venetian and Ottoman provincial administrations, and thus provide a clear example of the numerous cases of political and cultural continuity, syncretism, and cooption linking the Byzantine, Ottoman, and modern Greek era. In the Peloponnese a rough equivalent of the *armatoloi* were of the *kapoi* (singular *kapos*), whose role was also to guard against brigands. During the Ottoman period, however, the *armatoloi* were in the direct employ of the Ottoman state, whereas the *kapoi* were employed by the wealthy Greek landholding class known as the Primates. Although technically under the control of the Ottoman government, the *armatoloi* in many instances acted wholly independently, and for this reason came increasingly to be regarded by the Ottoman state as untrustworthy and possibly treasonous.

The primary target of the *armatoloi* were, in theory, the klephts, a generic and fairly loosely applied term used to designate the numerous brigands of the mountainous areas of Greece, brigands whose ranks were constantly replenished by an ample surplus male population fleeing the chronic regional problems of poverty and famine. In many instances, however, the boundary between klephts and *armatoloi* was fluid, and many *armatoloi* were, prior to their recruitment, active klephts. Indeed, in some instances individuals acted in both capacities simultaneously. The relationship between the two groups, then, was often one of collusion rather than hostility. This was most markedly the case during the late 18th and early 19th centuries, when Greek revolutionary activity relied heavily on both groups for its success.

The fluidity between the groups was also marked in specific territories where local Ottoman governors attempted to replace an old Greek *armatoloi* establishment with new hand-picked *armatoloi* of their own choosing. The most dramatic example of this is seen in the Epirot lands of Ali Pasha of Ioannina, who in the latter half of the18th century made the region's *armatoloi* almost exclusively Albanian. Deposed Greek *armatoloi* in such areas became klephts instead, and understood their subsequent anti-*armatoloi* behaviour to constitute not just a form of brigandry, but also a sort of resistance to Ottoman domination. Just as many *armatoloi* had earlier been klephts, so too were many klephts former *armatoloi*. Indeed, the French folklorist Claude Fauriel has argued that "the titles of Armatole and Klepht might be used almost interchangeably for either".

In Greek regions of the Ottoman empire the *armatoloi* were drawn largely from the Greek Orthodox population, a fact which was to have significant implications for the long process of Greek liberation, for in the revolutionary period the military and social power enjoyed by the *armatoloi* came to be equated with Greek revolutionary activity. In other regions, such as Bosnia and Albania, the *armatoloi* were drawn from the local Muslim populations. Both the klephts and *armatoloi* came in effect to be groups of well-trained guerrillas, trained over a lifetime of living in the mountains off pillage and forage, and were very important for their minute knowledge of Greece's moun-

tainous terrain, their stamina, and their ruthlessness during the first phases of the Greek War of Independence.

The *armatoloi* as an official force of the Ottoman state were disbanded by firman (imperial decree) in 1721, a full century before the first outbreak of the Greek War of Independence, but they continued throughout the 18th century to exist in practice if not in theory. During this period the Ottoman fear of Russian influence in the region, coupled with an increasing distrust of Greek *armatoloi*, led to the dismissal of most Greek *armatoloi* and their replacement with Albanian Muslims. The Greek former *armatoloi* became almost without exception klephts.

The importance of the *armatoloi* to both the Greek independence movement and to Greek historical tradition in general is amply testified to by Greek folk tradition. A common theme of Greek folksong is the narration of the exciting and dangerous lives of famous *armatoloi*, who are usually depicted not so much as the employees of the Turks as their antagonists. Other important sources for information regarding the *armatoloi* include the military memoirs of various participants in the Greek War of Independence, such as Nikolaos Kasomoulis, whose *Military Recollections* (*Stratiotika Enthymemata*) demonstrates their importance to the success of the Greek revolutionaries. The *armatoloi*, then, while marginal members of Greek society from a legalistic and political standpoint, were critical players in the early stages of the establishment of the new Greek state; and the success of the Greek War of Independence owes as much to them as to the intellectual elites who spread revolutionary rhetoric among the Ottoman Greek populations.

Summary

Armatoloi (literally "men at arms") were semi-official local militias which patrolled the mountainous Balkan territories of the Ottoman empire. They were intended to prevent brigandage, round up enemies of the state, and protect visiting travellers. They enjoyed a good measure of independence and were increasingly regarded as untrustworthy by the Ottoman government. Although officially disbanded in 1721, they continued to exist throughout the 18th century.

Armenia

In the Classical and Byzantine periods Armenia covered roughly the rugged upland plateau southeast of the Black Sea, south of Iberia (Georgia), and southwest of Caucasian Albania (Azerbaijan) and the Caspian Sea and also the more fertile lands of the upper Tigris valley; but its boundaries fluctuated greatly and it was frequently fragmented. Its early history is largely dependent upon foreign sources since the Armenian alphabet was not devised until *c.*AD 400 (although governmental documents and other texts were written in Iranian in Aramaic characters, Greek or, for some ecclesiastical documents, Syriac), and even for a few centuries after that most native histories were ecclesiastical and with little interest in secular matters.

The origin of the Armenians is mysterious. Although their language is the sole member of an Indo-European subgroup, they were probably of ancient Anatolian stock akin to the Hurrians and entered the failing kingdom of Urartu, with its capital at Van, from the west around 600 BC. The area's subsequent status as a satrapy of the Achaemenid Persian empire earned it brief mention by Herodotus (e.g. 3. 93), but the first substantial documented contact between Armenians and Greeks is given by Xenophon, who led the Greek mercenaries safely home from Mesopotamia through Armenian territory in 401–400 BC (*Anabasis*, 4. 4–5). After his victory at Gaugamela in 331 over Darius III, for whom Armenia had furnished 40,000 infantry and 7000 cavalry, Alexander appointed Mithranes, the turncoat son of the last Persian satrap, as its governor. Although the Seleucids never exerted direct control over the principalities of a usually fragmented Armenia, Greek influence grew rapidly and can be seen most vividly today in seven inscriptions cut into a rockface at Armavir in the Araxes valley around 200 BC, one of which refers to Hesiod while another is a compilation of extracts from Greek dramas. Seleucid overlordship ended when Antiochus III was defeated at Magnesia in 190 BC by the Romans, who allowed his two Armenian satraps Artashes (Artaxias) and Zareh (Zariadris) to establish themselves as kings of Greater Armenia and Tsophk (Sophene) respectively.

Greek acculturation increased, notably in the 1st century BC during the reign of Tigran II who, before being forced in 66 BC to cede many of his conquests and accept Roman suzerainty, briefly, in alliance with his father-in-law Mithridates VI Eupator of Pontus and chiefly at the expense of Parthia, made Armenia an important empire stretching from the Caspian to the Mediterranean. He built in the Hellenistic style his new capital Tigranakert (Tigranocerta, possibly the later Byzantine Martyropolis), to which he removed many thousands of Greeks. His philhellene inclinations continued under his son Artavazd II, who maintained a theatre and is reputed to have himself written tragedies and other forms of literature in

Greek. For much of the Roman period Armenia was a buffer state (and often the site of warfare) between the Roman and the Parthian or, later, the Sassanian empire, although the Romans did annex a small portion west of the Euphrates (Armenia Minor) and briefly under Trajan the whole area (Greater Armenia). Latin, however, made no headway and the elite continued to use Greek (and Iranian) in addition to their native tongue. The correspondence of Libanius, the celebrated rhetorician of Antioch in the 4th century AD, indicates that he taught at least 20 Armenian students. Owing to the swift and thorough conversion of the Armenians to Christianity (which became the official religion in 314) by the Parthian missionary Gregory the Illuminator, little Graeco-Armenian art survives and, owing to their scrupulous adherence to the commandment prohibiting the making of graven images, almost no sculpture. The sole surviving temple is a magnificent grey basalt peripteral Ionic structure erected by the Arsacid Trdat (Tiridates) I in the second half of the 1st century AD and preserved only through its conversion into a royal summer residence (though ruined by an earthquake in 1679 it has been reerected). Once housing a statue of Mithras, it still displays a luxuriantly carved frieze of Armenian and Hellenistic motifs. In the neighbouring Roman bath-house a mythological mosaic of Ocean and Sea offers the curious Greek inscription "we worked without reward".

A 50-year power struggle between the Sassanians and the Byzantines, in which the heavily involved Armenians attempted to assert some measure of independence, ended in 387 with a peace treaty in accordance with which the much larger eastern part of the territory (Persamenia) became a Sassanian and the western a Byzantine vassal state (later divided by Justinian I into four small provinces, Armenia I–IV, and considerably enlarged at Sassanian expense by the emperor Maurice in 591). Arsacid rule died out in both halves, the Sassanian *marzpan* (margrave) respecting the rights of the ever-quarrelling *nakharas* (local barons), the Byzantine authorities trying to destroy the feudal system and impose imperial institutions and customs. The Byzantines made another tactical error in their efforts to force the Chalcedonian formulation (451) of Christ's two natures unconfusedly, inseparably, and immutably within one hypostasis upon the Armenians, who charged the Byzantines with Nestorianizing and developed their own Church, formally severing their relations with the Constantinopolitan patriarchate at the second Council of Dvin (554). This, in combination with Sassanian attempts to convert them to Zoroastrianism, both encouraged a sense of nationalism, which was zealously fostered by the Armenian *katholikos* (archbishop), and in the 7th century to some extent facilitated conquest by the Arabs, who offered religious tolerance. Byzantium thus temporarily lost its share of Armenia.

The caliphate, while incorporating Iberia and Albania to create the huge province of Arminiya, established a military zone in the west, but the Byzantine crises of the early 8th century soon drew the Arabs still further west. The ensuing consolidation of Arab control of Armenia begat growing revolts from the *nakharas*, who were largely eliminated as numerous Muslim emirates were set up. In the 9th century, however, the resurgence of Byzantine power and its eastward expansion, coupled with the decline of the Abbasid caliphate, enabled the Armenians slowly to regain control of their affairs. The Bagratid dynasty was established in the major portion of the country with the coronation of Ašot I in 884, while in 908 the Artsrunid Gagik became king of Vaspurakan, which lay in the south between lakes Van and Urmia. Caliph and emperor vied with each in granting recognition and honorific titles to Armenian sovereigns.

The Byzantines were themselves responsible for the destruction of this bulwark against their Muslim foes. Although in 974 the attempt by John I Tzimiskes (himself of Armenian origin) to expand Byzantine territory was rebuffed so effectively by Ašot III that the emperor was induced to declare him an ally and "spiritual son", Taron in the southwest had already been taken over under his predecessor Nikephoros II Phokas, while his successor Basil II annexed Armenian Tayk in the northwest. Even more seriously, Vaspurakan was ceded to the Byzantines in 1021–22 and Ani, the royal capital founded by Ašot III east of Kars, was surrendered in 1045. Thus by the middle of the 11th century most of Armenia was divided into Byzantine themes and its nobility had fled abroad. The first Seljuk raid into Armenia was ordered by the sultan Tughrul in 1048, Ani fell to Alp-Arslan 16 years later (prompting a futile cession of Kars to the Byzantines), and when Romanos IV Diogenes lost the Battle of Manzikert in 1071 there were no Armenian leaders left to prevent the Seljuks from sweeping through the rest of their territory and into Anatolia and thereby depriving the Byzantines permanently of most of their Asiatic possessions. Armenia itself enjoyed a brief respite, with Georgian protection, under the rule of the Christianized Kurdish Zakarids before falling into the hands of the Mongols in 1236.

The Seljuk conquest created an Armenian diaspora. Many Armenians fled north to Georgia or the Crimea and thence to southern Russia and Poland, while others moved southwest into Cilicia. This was the mountainous area between the Taurus and Anti-Taurus ranges, but included too the fertile lowlands around the Gulf of Alexandretta and the crucial Cilician Gates (the easiest pass through the Taurus from Anatolia and thence to the eastern littoral of the Mediterranean). Some Armenians were already there, since, after Nikephoros II Phokas had wrested a largely depopulated Cilicia from the Arabs in 965, the Byzantines had appointed local Armenians as governors and later had ceded them tracts of land, thus making possible the establishment of independent enclaves only nominally obedient to Constantinople. After a short-lived unification under an Armenian adventurer known to the Byzantines as Philaretos Brachamios (Varazhnuni), local Armenian chieftains slowly extended their domains at imperial expense, despite briefly successful campaigns by John II Komnenos and Manuel I Komnenos in 1137–38 and 1158 respectively, and from 1199 Cilicia was an independent kingdom under the Armenian Rubenid and Hetumid and latterly the Latin Lusignan dynasties until it fell to the Mamluks in 1375. Its position on a major east–west mercantile route enabled Cilicia to prosper for a while, especially while it enjoyed the Mongols' protection in the second half of the 13th century before the latter's conversion to Islam. Contact with the Latins began in 1097 with the First Crusade and, partly through intermarriage, the Armenians became increasingly influenced by westerners rather than Byzantines, a

development which even led to highly divisive and ultimately aborted attempts at ecclesiastical union with Rome.

After Mesrop Maštoc, with the aid of the Greek calligrapher Rufinus, had devised an Armenian alphabet, there was an immediate surge of Armenian translations, produced largely in important Christian cities, notably Constantinople and Edessa and, a little later, Jerusalem. At first these translations, starting with the Old Testament's Proverbs, were almost exclusively religious. Lives of eastern martyrs, Syrian patristic texts, and Eusebius' *Ecclesiastical History* were translated from Syriac, Eusebius' *Chronicle* and works by the Cappadocian Fathers, Athanasius of Alexandria, and others from Greek. Many Greek works, including *Questions and Answers on Genesis and Exodus* by Philo Judaeus and some by John Chrysostom, are known only from Armenian translations. After that initial burst of energy religious translations were sporadic, although activity revived around 700 when Stephen of Siwnik translated *inter alia* the corpus of pseudo-Dionysius the Areopagite, and again in the Cilician period, especially by Nerses of Lambron, who sought out rare Greek (and Latin) texts. Owing to theological disagreement very few post-Chalcedonian Byzantine works were translated into Armenian, George of Pisidia's *Hexaemeron* being a rare exception (as, significantly, are the polemical treatises of the monophysite patriarch of Alexandria Timothy Ailouros).

In secular literature the most influential translation was of the *Art of Grammar* by Dionysius Thrax, which spawned extensive Armenian commentaries, followed by redactions of the rhetorical works of, among others, Theon and Aphthon. In philosophy translations were made of Aristotle, Porphyry, and the 6th-century Alexandrians Olympiodorus, Elias, and David (wrongly claimed by Armenians as a pupil of Mesrop Ma_toc), thereby showing an interest particularly in logic. Other works appeared in redactions to accommodate Christian beliefs (e.g. the *Alexander Romance*) or Armenian interests (e.g. the Syriac *Chronicle* of the late 12th-century Jacobite patriarch of Antioch, Michael I). Original Armenian theological writing is largely defensive in respect to Byzantium. Historical compositions show little interest in Byzantium as such, but are often important in supplying information on the empire's eastern borders: Matthew of Edessa's *Chronicle* is of particular value for information on imperial involvement in Cilicia. Byzantine interest in Armenian literature is minimal, although there are Greek translations of the establishment of Christianity in Armenia by the pseudonymous Agathangelos and a pro-Chalcedonian anonymous account of Armenio-Byzantine ecclesiastical relations (now known as the *Narratio de Rebus Armeniae*) written *c.*700 and, significantly, lost in the Armenian original.

The Byzantine contribution to Armenian architecture is immediately evident, but styles of other circumjacent states (especially Syria) left their marks too. In the other direction, despite the wild exaggeration in the famous claims of Joseph Strzygowski for the Armenians' adaptation of Central Asian styles learned through Sassanian intermediaries and passed on by them to the whole of Christendom, Armenian architects did indeed develop great expertise which was not without effect upon Byzantium. Notably it was the Armenian master builder Trdat who was deemed most capable of repairing the damage caused by an earthquake in 989 to Constantinople's principal church, Hagia Sophia. Materials available dictated that virtually all churches were constructed of a rubble conglomerate faced with large blocks of yellow, red, or grey tufa. Simple single-aisled basilicas, some according to historical accounts adapted from Hellenistic temples and all small except for a remarkable example of *c.*500 at Ereruk, gave way in the 6th century to domed (usually cross-domed) buildings, with squinches or (less often) pendentives. This experimentation with centralized plans is almost certainly due to Byzantine influence. During the period of Armenian independence in the late 9th to early 11th centuries, drums and domes grew taller and were often distinctively polygonal (the latter usually also conical or pyramidal), while some Islamic features such as *muqarnas* (stalactitic squinches) appear. Cilician churches were largely traditional.

Figural sculpture became far more widespread, dominant, and exuberant than in Byzantine architecture, the outstanding, though somewhat idiosyncratic, example being the early 10th-century figures and biblical scenes on the exterior of the church of the Holy Cross on the island of Aghtamar in Lake Van, where Graeco-Roman and Arab elements jostle with Byzantine. The few surviving examples of interior fresco decoration largely follow Byzantine models, but interestingly at Aghtamar there is an Old Testament (Genesis) cycle (long abandoned in the Byzantine world) and at Tatev western artists are reputed to have been employed in the early 10th-century church of SS Peter and Paul. Manuscript illumination is usually iconographically and stylistically Byzantine, but in both respects (and sometimes even as late as the 12th century) harks back to the pre-iconoclastic period, while some 11th-century pmanuscripts exhibit the stark naivety of painters striving to reduce art to its essentials. Cilician Armenian painting is often highly individualistic. While some of its manuscript illuminations are again naive, others show a consummate intimacy with Byzantine work but yet have an expressiveness of their own; this is especially so in the work of the outstanding late 13th-century painter Toros Roslin, who worked mainly at Hromkla, whither the patriarchal see had been transferred in 1151. In the 14th century his namesake Taron was prominent in a group which deliberately opposed Byzantium in developing anti-Chalcedonian imagery.

As a result of forced eviction and voluntary migration, Armenians constituted a substantial minority of the Byzantine population, even when Armenia itself was not in imperial hands. Their military valour induced emperors, beginning on a small scale with Justinian I, to transplant them to threatened border regions. In the late 6th century the emperor Maurice proposed to the Sassanian monarch that Armenians on either side of their line of partition through the country should be deported, and for his part moved a vast number to Thrace (then including much of modern Bulgaria, which still has a sizeable Armenian minority). Thousands more were moved there later by Constantine V and to neighbouring Macedonia by Basil II. Tiberius II forced possibly as many as 10,000 to migrate to Cyprus in 578, Nikephoros I used them to resettle Sparta in the early 9th century, and Nikephoros II to resettle Crete after his conquest of the island in 961, while others were sent to Sicily and southern Italy in the 8th and 9th centuries. Religious belief was the cause of another Byzantine resettlement in an attempt under Basil I in 878 to extirpate the viru-

lently iconoclastic Armenian Paulicians who had established their own state around Tephrike (Divriğl) in Cappadocia. (It is still unclear if they were Adoptionists or Manichaean dualists believing in a docetic Christology. Despite their expulsion they spawned the communities of the Tondrakites, which continued to cause Byzantium problems into the 11th century.) Foreign invasion, and especially the Arab seizure of much of their territory, also forced or encouraged many thousands of Armenians to migrate to the Byzantine theme of Armeniakon and elsewhere in Asia Minor, Constantinople itself, and Bulgaria. In times of relative quiet, military enlistment and possibilities for economic advancement, especially through trade, induced many others to leave their homeland for the empire (and the caliphate).

The Byzantine attitude towards Armenians was generally, though not uniformly, unfavourable. In writing to his Sassanian counterpart, Maurice (the tradition of his own Armenian origin is most probably apocryphal) called them "a knavish and indocile nation" and claimed that whether they killed or were killed in Thrace enemies would have died. The patriarch Joseph I Galesiotes pronounced them "morbid and rebellious" and the patriarch Athanasios I classed them with Jews as defiling to Christians. Doubtless the majority's rejection of Chalcedonian dyophysitism, the internecine turbulence of their country whether under foreign rule or not, their stubborn adherence to their own culture, and their usually rustic manners were distasteful to the educated city dwellers who constitute most Byzantine literary sources. Moreover, what little evidence there is suggests that this contempt may have been shared by the lower classes. Nevertheless Armenians played a prominent role in Byzantine history.

Procopius claims that emperors had traditionally chosen Armenians for their bodyguard and names no fewer than 17 Armenian generals who were employed by Justinian: of these one, the aged eunuch Narses, was given supreme command of Byzantine forces in Italy and crushed the Ostrogothic forces of Totila in 552. From the late 6th century until the Arab invasion of the mid-7th Byzantine military recruitment was largely Armenian, since Avaro-Slavic incursions into the Balkans severely restricted possibilities there. It has been estimated that even after that, until the loss of Anatolia to the Seljuks, Armenians drawn from Byzantine-controlled territory predominated in the Byzantine army. Some, and most who achieved high rank, were, however, of Chalcedonian persuasion. Several emperors of the 9th and 10th centuries were of Armenian origin: Leo V, a fine and honest soldier responsible for the restoration of iconoclasm; Basil I, born into a family transplanted to Macedonia and founder of the "Macedonian" dynasty; Romanos I Lekapenos, a highly successful emperor and the only navy officer to attain that position; and John I Tzimiskes, another militarily competent emperor. In addition Theodora, wife of Theophilos and later regent for their son Michael III, was of Armenian origin, and other emperors had Armenian connections. Generals, loyal, and especially traitorous (Kazhdan finds 25 mutinies under Armenian leadership, or at least with Armenian participation, between 976 and 1204), were often of Armenian stock. Among good servants of the empire were Melias, the Armenian prince Mleh who founded the *kleisoura* (small administrative unit) of Lykandos in the Anti-Taurus mountains, and John Kourkouas, who recovered the holy Mandylion of Edessa: both played an important part in Byzantine expansion eastwards. Armenians were less likely to be courtiers (at least until the Komnenian period), but even here there were influential figures like Stylianos Zaoutzes, at one time father-in-law of Leo VI. At least two 12th-century patriarchs were of Armenian stock: Michael II, of the Kourkouas family and, on his father's side, Theodosios Boradiotes. While there were no specifically Armenian monasteries on Mount Athos, there were Armenian monks there, one of whom, Theoktistos, abbot of Esphigmenou, rose to be *protos* (head) of the whole community in the 1030s. The annexation of Armenian territory in the late 10th and first half of the 11th century hugely increased the number of Armenians in the empire, and it has been estimated that in the latter century 10 to 15 per cent of the Byzantine aristocracy were Armenian. Nevertheless, in the Komnenian and Palaiologan periods they appear to have filled far fewer positions of authority, and with the creation of an Armenian state in Cilicia the arrival of newcomers came to an end.

Army

Armies and war making were the focus of one of the landmarks of early Greek culture, Homer's *Iliad*. The epic poems of the 8th century BC looked back to the battles and warriors of the Bronze Age, so vividly depicted in the *Iliad*, with awe and fascination. War making played a key role in the Mycenaean heroic age and its aftermath, after 1100 BC, when the Dorians, Iron Age warriors who invaded and eventually settled in Greece, changed the political and social landscape. The dearth of historical and archaeological information on the post-Mycenaean years, the so-called Greek Dark Age between 1100 BC and 800 BC, makes it difficult to ascertain the exact causes and consequences of the decline of the Mycenaeans. It appears, however, that the decline of Mycenae had begun before the advent of the Dorians. It appears also that a series of invasions by the armies of the migrating Sea Peoples (who overran the Hittite empire, and sought to conquer Egypt, and one of whose tribes, the Philistines, settled in Palestine) were among the factors leading to the general exhaustion that marked the Mycenaean world even before 1100 BC. After 1000 BC Greek society was reduced to small local communities, from which there gradually emerged the city state (polis).

Military conflict between the city states of mainland Greece was not rare even at a later period, between the 8th century BC and the beginning of the Persian Wars in the early 5th century BC. Yet, with the exception of Sparta, the city states sought to avoid the maintenance of a standing army. By the time of the first Persian War (490 BC) most city states used cavalry, but its extensive use was confined to the Thessalian League. For the rest, their military strength was represented by the organization of the infantry. The hoplites, the armed citizen-soldiers, fought on foot and were organized in companies (*lochoi*) and platoons (*enomotiai*). In the ten years between the first and the second Persian War (480–479 BC), Athens concentrated on strengthening its sea power by building a large trireme fleet. After the Persians' devastating defeat in 479 BC, which ended the Persian threat to the Greek world, Athenian hegemony was established gradually in mainland Greece and, with the help of the Delian League, throughout the Aegean, from Thasos to Rhodes.

Armies in Classical antiquity represented the organized mobilization of citizenry in case of war. Therefore, while military conflict was not uncommon, it implied the temporary militarization of life – again with the exception of Sparta, the only city state in which a militaristic structure and way of life defined all other social and political activity. In Athens the relaxed quality of civic life in the polis during the Periclean age is contrasted by Thucydides to the poisonous atmosphere brought about through war, militarization, and the suspension of many features of the Athenian democracy. The Peloponnesian Wars (460–445, 431–404 BC), caused by a complex series of perceived threats and counter-threats, manifested the consequences of the imperial expansionism of the Athenian League and the commitment by Sparta and the Peloponnesian League to total victory and the destruction of the power of Athens. In particular the second, so-called Great, Peloponnesian War displayed a succession of intense clashes and a relentless crusade towards total supremacy. It was the dominance of that mentality in both camps that explains the Sicilian expedition in the final years of the war, a colossal undertaking by Athens aimed at conquering Sparta's allies in Sicily. The defeat of Athens left Sparta in the position of a dominant player. But the inward-looking character of the Spartan regime, combined with the fragmentation of the Greek city states and the efforts by the Persians to influence political developments in Athens and elsewhere, resulted in political complications which moderated the significance of the Spartan victory.

The rise of Macedon in the 4th century BC, which soon put an end to Spartan supremacy, owed much to the military innovations introduced and perfected by Philip and his son Alexander the Great. These were the development of siege weaponry to obviate the need for lengthy blockades, and the perfection of infantry/cavalry tactics based on new models for the organization of the deep phalanx, which enabled complex manoeuvres and combined infantry/cavalry deployment (Connolly, 1977 and Humble, 1980). In the invasion of Asia Alexander led an army in which not only Macedonians but all Greeks participated, with the exception of the Spartans. After Alexander's death (323 BC) the Macedonian empire suffered the wars of the generals, which introduced the war elephant to the battlefield. The fragmentation of the Hellenistic world, the result of intense conflict between Alexander's successors, prepared the ground for the gradual absorption of large segments of that world into the emerging Roman empire.

Throughout the Roman and early Byzantine periods, inhabitants of the Greek peninsula often served in the auxiliary cohorts of the army, which was a professional long-service force. Discharged veterans received a pension from a public fund and/or a small estate. In the Byzantine period the administrative structure of the empire was dependent on the spatial organization of the military command in politico-military units (themes) led by generals. The theme was a combined administrative and military unit established by the emperor Herakleios in the 7th century AD and, despite subsequent changes and reforms in other aspects of the army, this basic structure was preserved. By contrast, there was considerable temporal variation concerning military duties and conscription. At some point, all adult male subjects under the age of 40 had to be available for military service. Foreign mercenaries were used extensively on various occasions, particularly (but not exclusively) after the 10th century. The imperial guard had only foreign soldiers, mainly from northern Europe and Scandinavia (the Varangian Guard). During the years of Ottoman rule, war making and the army were in the hands of the Muslims, while trade and economic activities were left to

the non-Muslim subjects, usually Greeks and Jews. Yet the Ottomans also had licensed bands of Christian irregulars (the *armatoloi*) in mainland Greece in order to use them against the brigands (the klephts) who often dominated the mountainous districts of the region.

The Greek War of Independence was fought against the Ottomans mainly by Christian irregulars and brigands, bands of philhellenes, and, on a couple of occasions, regular European armies. In the War of Independence and in subsequent political developments an important role was played by the *armatoloi* and the klephts, a "distinctive military class" (Koliopoulos, 1987) which was the product of the years of Ottoman rule combined with the geographical (a mountainous terrain) and social particularities of the Greek peninsula. These groups continued to play key roles after 1830, when the modern Greek nation state came into being. The territorial settlement of 1830 was seen by many as provisional; Greek irredentism was a formidable force between 1830 and 1922, when the irredentist drive came to an abrupt end with defeat at the hands of the emerging Turkish secular state. The irregulars of the War of Independence followed two paths after 1830. Some joined the Greek army, which was gradually developed along Western lines. The regular army soon became an important mechanism, along with the educational establishments, for the social and often also the linguistic Hellenization of its recruits (Kitromilides, 1989). Others remained outside the regular army. In the latter category, most joined irredentist bands which became the protagonists of nationalist mobilizations in the mid-1850s, in 1877–79, in 1897, and in the struggle for Macedonia in the early years of the 20th century (1903–08).

Despite early efforts, particularly by the Trikoupis governments, to perfect the regular army, it was only in 1912 that the Greek state was in a position to use a well-organized and equipped professional army. From the beginning of the 20th century to the mid-1970s the army played key roles in political development, starting with the coup in 1909 which, apart from its corporatist aspects linked to the officers' professional concerns, appeared to favour liberal politicians. In this sense the 1909 coup presaged and favoured a bourgeois outcome. The new regime after 1909 did much to increase military professionalization. In turn, Greek gains in the Balkan Wars (1912–13) did much to increase the domestic prestige and role of the army.

But the domestic role of the army soon became so entangled in political strife that it was difficult in the interwar period to distinguish between interventions by the military as an institution and the use being made by segments of the political elite of different groups of military officers. Pronunciamentos, coup attempts, and other forms of intervention by royalist officers against a liberal government and by liberal officers against a royalist government became common, resulting in considerable politicization of the army. The Civil War of the 1940s reinforced internal security as a major task for the army, and the controlled and limited democracy which ensued in the 1950s saw the army assume the position of an arbiter of the regime. Still, despite its militaristic features, the regime of controlled democracy reintroduced the aforementioned intra-military fragmentation along political lines. This is evident in the coup of 1967, which was meant to block the possibility of a centre-left government emerging from the planned elections of that year. The fierce anti-communism of the junta should not be taken very seriously as the main explanation for the coup. The politicization of the army being a critical background factor, the authoritarian regime of 1967–74 reflected to an extent the efforts by middle-ranking officers to reassert the role of the army as an arbiter. In fact, the royalist generals had been preparing a coup on behalf of the king in 1967, when the junta took over and neutralized both the centre-left and the royalist factions in the officer corps. The officers who led the coup in 1967 had been members in the 1940s of a far right military fraternity known by the initials IDEA (Holy Band of Greek Officers). The group had been founded among Greek officers in the Middle East during the German occupation of Greece.

The breakdown of the authoritarian regime in 1974 amid foreign policy crises and domestic upheaval marked a crucial change in the army's position in the political system. The Karamanlis government, angered by apparent US and NATO passivity and tolerance of the Turkish intervention in Cyprus, decided to withdraw from the military section of NATO. The withdrawal had two aims. First, it wanted to give the Greek government complete control over the armed forces in case of a direct Greek–Turkish clash. Second, it was a symbolic act indicating Greece's determination to defend its national interest and search for appropriate alliances in the process rather than the other way round (the structure of alliances determining the course of action). Greece's NATO withdrawal was a tactical mistake. First, it left Athens with no ability to influence the NATO Council during subsequent developments. Second, it gave a mixed signal to the West, complicated by the fact that French influence in Athens, which was on the increase, particularly irritated the USA. Third, the Greek military establishment was cut off from its NATO links, even if only temporarily. This was a mixed blessing for the new regime in Athens. On the one hand, to the extent that the military regime had any clear US or NATO backing, this move could perhaps have facilitated the democratization process. On the other hand, the move underlined the extent to which the post-junta role and legitimacy of the Greek military became dependent on Greek–Turkish rivalry. Last but not least, the fourth implication of Greece's withdrawal was that when Athens decided to return to the military section of NATO a few years later the Turkish side was able to negotiate, along with the other partners, the conditions for Greece's reintegration.

The crisis in relations with Turkey over Cyprus in 1974 left the impression in Greece that the Greek army was inadequately prepared and that its domestic preoccupations had undermined its credibility as a military force abroad. After 1974 the army went through a process of reorientation from its traditional role (internal security plus commitment to defend the northern borders against NATO enemies) to a new one (protection of national interests against perceived Turkish expansionism). The professionalization of the officer corps has increased since the return to democracy in 1974 and has been combined more recently with modern curricula at the Military Academy, regular exchanges in western Europe and the USA, and efforts to better integrate new officers within a democratic context. Developments in international relations in south-eastern Europe since 1989 have added a new dimension to the

role of the Greek army, in view of the fact that the defence orientation towards the eastern borders against a background of relative stability in the north cannot now be taken for granted.

Bearing in mind the peculiarities of the country as well as the analytical issues posed by the comparative examination of the role of the army in newly consolidated democracies, it can be argued that the role of the Greek army in the 1990s was defined by four main parameters. First, Greece maintained a very substantial level of defence spending, one of the highest in NATO. Second, there were waverings (inherited from the early, populist years of PASOK in government in the 1980s) between a clearly defined role for the professional army and a rather confused notion of popular defence (*pallaiki amyna*) whose original conception in the 1980s had borrowed freely from both the Israeli and the late Yugoslav models. What enabled the continuation of this debate was the third of these parameters, namely, the evolution of Greek–Turkish rivalry over Cyprus and certain issues which concerned the Aegean, coupled with the weighty role of the military establishment in Turkish politics. Finally, developments on the EU front were crucial in two respects. On the one hand, the agreement over Economic and Monetary Union put increased pressure on Greece to adjust its economy in order to be able to participate in the Euro zone after 2001. There are crucial budgetary dilemmas ahead, and military expenditure cannot avoid becoming embroiled in the debates at some point. On the other hand, the steps towards strengthening the Western European Union (WEU) created the opportunity for Greek military integration in WEU mechanisms and operations. The Yugoslav conflict and subsequent peace-keeping operations in the area offered the opportunity for involvement by the Greek army in new roles in a combined UN-NATO-WEU structure.

Unlike comparable processes in Spain and Portugal, Greece's change of regime and democratic consolidation after the mid-1970s had to address the issue of the new role and legitimacy of the army with reference to a major external factor. It remains to be seen whether Greek political elites will now endeavour to shift the reference point for the legitimacy of the post-authoritarian role of the Greek army from Greek–Turkish rivalry to common European security. This is, of course, an interactive process, and depends also on developments on the Turkish side. The Europeanization of Turkey will increase the likelihood of cooperation in Greek–Turkish relations, while regression to militarist nationalism or a shift towards Islamic fundamentalism, the other possible paths for the future of the Turkish state, may favour conflict. Despite oscillations, the general trend in Greece since 1974 has favoured high military spending legitimized through the precipitate embrace of a mentality of *vis pacem, para bellum*. As the challenges of European convergence and Europeanization require the mobilization of energies and resources towards a new direction, old maxims and inherited "common wisdom" need to be re-examined.

Arrian *c.*AD 90–160

Historian

In his preface to the *Anabasis of Alexander* Arrian declares that wherever Ptolemy and Aristobulus, the Alexander historians, "have both given the same accounts of Alexander the son of Philip, it is my practice to record what they say as completely true, but when they differ, to select the version I regard as more trustworthy and also more telling". He has chosen these two authors because both of them took part in Alexander's expedition and both wrote after his death, thus not being "under any constraint or hope of gain", particularly Ptolemy, who became king. Other accounts Arrian intends to record only as "tales" told of Alexander (Praefatio, 1–3). In this unique statement on principles of selection and use of sources Arrian sweepingly disqualifies the bulk of his predecessors, including Callisthenes (mentioned only as a historical figure in the *Anabasis of Alexander*), Clitarchus, Diodorus, and Plutarch, names that never appear in Arrian's extant works. In the so-called "second preface" to the same *Anabasis* Arrian even boasts that before him Alexander's exploits were never properly recorded, and that he, at last, "will make Alexander's deeds known to men" (1. 12. 2–5). He also displays a similar attitude elsewhere. In the *Indica* (2. 9) he singles out Eratosthenes as "more trustworthy than any other writer", and Nearchus and Megasthenes since both are "remarkable men" (17. 6); in the opening chapter of the *Tactica* he enumerates tactical writers, including Pyrrhus, Polybius, and Posidonius, only to declare them all useless.

Predecessors and sources are not necessarily models. Arrian's ideal was Xenophon – his career as a soldier and, later in life, as a retired gentleman-writer (*Cynegeticus*, 1). He called himself "Xenophon", and was nicknamed the "new Xenophon" by later biographers. Arrian was indeed as prolific and versatile a writer as Xenophon. Like Xenophon, who started his intellectual career as a disciple of Socrates, Arrian began his as a disciple of Epictetus, turning thereafter to other subjects. Yet, he did not write contemporary history as Xenophon had done. All his historical work bears upon the past: the *Antiquities of Bithynia*, the monographs on Dion and Timoleon, the *Anabasis of Alexander*, the *Events after Alexander*. Actually, he must have had more than one model. Herodotus, for example, is quoted and used several times. Arrian's works bristle with Herodotean reminiscences in content, in vocabulary, and in style. In true Herodotean fashion he reports versions that he does not credit, has reservations about his sources, and leaves it to others to judge or explain. In the *Indica* he even adopts the Ionic style. Sometimes he feels compelled to find a compromise between Herodotus and his avowed model Xenophon. A case in point is his belief in the existence of Amazons in mythical times, as attested by Herodotus and by Athenian funeral orators, while disbelieving their survival in historical times, as Xenophon's silence would suggest (*Anabasis*, 7. 13. 5–6). Arrian's debt to Thucydides and Theopompus (never mentioned by name) should perhaps remain a matter of speculation, but the influence of Atthidography on his local chronicle of Bithynia (*Bithyniaca*) is quite evident. His presumably continuous survey of Bithynian antiquities from mythical times to 74 BC, as well as his self-identification as a priest of Demeter and Core, the tutelary goddesses of Nicomedia, echo a topos already exploited by Cleidemus and Philochorus in the 4th century BC.

Having predecessors, and even being influenced by them, does not necessarily imply slavish imitation. Arrian read and absorbed his sources, but though sometimes he followed them passively, he developed a style of his own. His historical work is a mixture of the "pragmatic" school of Thucydides, Xenophon, and Polybius, and of the encomiastic trend of Alexander-historians such as Callisthenes and the "vulgate" tradition. And, of course, Arrian was a child of his times. The very project of compiling a laudatory monograph on Alexander cannot be dissociated from the impact of the Parthian wars of Trajan on Greek intellectuals, or from the reminiscences and propaganda about the Persian wars emanating in the 2nd century from Hadrian's Panhellenion in Athens.

Arrian's reputation among his younger contemporaries and later, as having an exemplary career as a philosopher, a historian, or a master of style, is well attested. For Lucian, Arrian was "a disciple of Epictetus, a Roman of the highest distinction, and a life-long devotee of letters", a man who did not disdain writing the life even of the brigand Tilliborus (a work otherwise unknown). Aulus Gellius was acquainted with Arrian's edition of Epictetus' *Discourses*. Cassius Dio wrote a "Life of Arrian the Philosopher" (not extant) and in his *Roman History* he mentioned Arrian's role in the war against the Alani. Dexippus apparently used and followed closely Arrian's history of the Diadochi without mounting his name. In the 4th century AD Eusebius put Arrian's *floruit* in AD 149/50 and Themistius pronounced him a famous example of a philosopher engaged in public life. In the 5th century Malalas called Arrian a "most wise chronographer" and used his *Parthica* for Trajan's wars. His contemporary Johannes Lydus quoted him on the antiquities of the Parthians. Procopius quotes him on Kytaia, the Colchian city of Medea, and the Neoplatonist Simplicius mentions a *Life of Epictetus* written by Arrian. In the 6th century Stephanus of Byzantium used Arrian extensively, consulting particularly the *Bithyniaca* and the *Parthica* for his own purposes and quoting verbatim several passages.

Photios's encomium of Arrian, appended to the epitome of the *Events after Alexander*, is one of the longest in the *Bibliotheca*. To Photios, Arrian was "inferior to no one of the best writers of history", a true imitator of Xenophon, a writer worthy of praise for his clarity, composition, and style, as well as for his lack of out-of-place digressions and parentheses, and for his traditional choice of words. Photios abridged Arrian's historical works and knew of his edition of Epictetus' teachings. Arrian's reputation for composition is also attested in Byzantine times by the anonymous author of a treatise *On Syntax*.

The *Suda* lexicon has an entry on Arrian and refers to him repeatedly, particularly to the *Parthica*, from which many substantial passages are quoted. A 10th-century collection of *excerpta* includes passages from Arrian's *Anabasis of Alexander*, and a passage from this same work on the statues of Harmodius and Aristogiton at Athens is quoted in the scholia to Proclus' commentary on Plato's *Timaeus*. In the 12th century Tzetzes and the *Etymologicum Magnum* used Arrian's *Bithyniaca*, and Eustathios drew heavily on both the

Bithyniaca and the *Anabasis of Alexander* for his commentaries on Homer and Dionysius Periegetes, preserving sizeable passages quoted verbatim. Finally, around 1200 the Codex Vindobonensis (Vienna, Nationalbibliothek, hist. gr. 4) was copied, from which all the extant manuscripts of the *Anabasis of Alexander* are descended.

DAVID ASHERI

Biography

Born in Nicomedia in Bithynia *c.*AD 90, Arrian studied under the Stoic Epictetus before moving to Greece (108–12) and a career in the civil service under Hadrian. He served as legate of Cappadocia (131–37) and then retired to Athens where he died *c.*160. Arrian wrote on a wide range of subjects including geography, hunting, military tactics, and local history, but is best known for his *Anabasis*, a history of the campaigns of Alexander the Great.

Arta

Town in Epirus

The town of Arta lies some 14 km north of the Ambracian Gulf, in a bend of the Arachthus river where it winds down from the Xerovouni mountains to the west coast of Greece. It has always been the principal coastal town of the district of Epirus, and was known in antiquity as Ambracia. Its situation close to the estuary of the Arachthus allowed its inhabitants to reap the agricultural benefits of the flat, fertile, and well-watered surrounding land.

The area was first colonized by Corinth in the late 7th century BC, and a century later had become fully established. Pyrrhus, the king of Epirus, the son of Aeacides and Phthia, consolidated his position by settling there in 295 BC, and was the first ruler to make the town into a substantial capital, erecting many public buildings and sculptures. These were largely removed by the Romans when they took the town in 189 BC, and the inhabitants were moved to populate the new city of Nicopolis.

During the medieval period Arta became an important Venetian trading post, and by the mid-12th century was the seat of an archbishopric. However, the geographical remoteness of Epirus from the main centres of power in Greece meant that it was never given any great significance in imperial Byzantine policy. This remoteness was turned to advantage after 1204, when the dismemberment of the Byzantine empire after the Fourth Crusade allowed Michael I Angelos to establish an autonomous Byzantine state with its capital at Arta, thus initiating the most brilliant and (for the Greek world) influential period of the town's history. He adopted the title of despot, and so the despotate of Epirus became an independent state that was to persist under various governments until long after Turkish rule had been established in the rest of Greece.

The surviving monuments of Arta provide a vivid demonstration of the individuality that was established during its years as capital of a Byzantine despotate. Although acknowledging Byzantine traditions, the town is much closer to Italy than to Thessalonica or Constantinople, and western influences clearly formed part of its cultural input. The fortress on the town's low acropolis has visible Classical foundations, and its walls, now much restored, contain reused Classical *spolia*, although they now have little to show of their medieval past. But it is the large metropolitan church of the Panagia Parigoritissa ("Virgin of Consolation") which conveys most graphically the meeting of Constantinopolitan and western

Arta: bridge on the Arachthus river at Arta, celebrated in legend and song

sources that was such an authentic feature of the despotate. Built between 1283 and 1296 to a square plan, its west, south, and exterior walls are pierced by two rows of double-arcaded windows, and appear to have more in common with the forms of a central Italian *palazzo* than with any Byzantine tradition, but the five apses and six cupolas all show the Greek origins of the despotate. Further acknowledgement of Byzantine origins can be found within the spacious interior of the church, where a relief of a double-headed eagle is set into the floor and mosaics can just be seen high up in the large central cupola.

Two other churches in Arta itself broaden this impression: that of St Basil, a wooden-roofed basilica of the second half of the 13th century, of which the most prominent feature is an outstandingly rich and colourful exterior at its east end, formed partly from glazed polychrome tiles; and that of St Theodora of 1246–67, of which the dedication is due to the pious Theodora of the family Petraliphas, the wife of the despot Michael II (1246–67), whose tomb is located here. She appears in the graphically expressive relief carving of the tomb with beside her the second of her six children, the despot Nikiphoros I (1267–96).

Among other churches that exemplify the vitality of the despotate in the surroundings of Arta, that of Pangia tou Vlacherna, in the village of Vlacherna, demonstrates the inventiveness of local builders who, under the despot Michael II, added three cupolas to what was originally a 12th-century three-aisled basilica. The smaller, domed, 13th-century church of St Nicholas tes Rhodias, built on an inscribed cross plan, is distinguished by a broad Greek meander pattern, set in thin bricks and running right round its exterior; this gesture to antiquity is balanced by some unusual 13th- to 14th-century frescos on its interior walls.

The prosperity of Epirus and the major town of Arta meant that they were coveted by a succession of powers under various leaders. Both before and after the restoration of Greek rule in Constantinople in 1261 attempts had been made to regain control of Arta by successive emperors, but a long period was to ensue when its rulers were principally non-Greeks. For almost 20 years until 1338 it had been occupied by the Orsini family, who were then ruling in the Adriatic as counts of Cephalonia. Andronikos III recovered Arta for the Byzantine empire in that year, but by 1348 it had fallen to Stephan IV Dushan, the powerful and ambitious *kral* of Serbia. In 1359 his successor, Symeon Uroš, decided to divide his growing territory in northern Greece, and placed Arta under the care of an Albanian lord, Peter Losha, giving him the title of despot of Arta and Rogoi. This despotate survived until 1384, when Italians from the Adriatic restored hegemony, and the fortunes

of Arta became linked to the counts of Cephalonia, with their islands of Ithaca and Zakynthos and mainland holdings in western Greece.

Albanians again became involved in the fortunes of the town when Muriki and Yaqub Spata became lords of Arta between 1399 and 1416, until another Italian, Carlo Tocco, entering Arta in 1416, declared himself despot. The growing Turkish power meant that for much of the 15th century Venice was to assume, in order that its many possessions should be protected, an increasing power and responsibility in the area, and the last nominal despot of Arta, Leonardo III Tocco, was left to rule by the agreement of the republic. When he died in 1479, all of Epirus, including Arta, was under full Turkish control.

During the centuries of Ottoman domination Arta was to share the fate of the rest of Greece, and even so was only to achieve its desired status as fully Greek territory quite late in the struggle for Greek independence. Its geographical position was again to become important when, in 1832, the Arta–Volos line was established as the northern limit of the new kingdom of Greece. In spite of this, the town of Arta with its immediate surrounding territory was only to emerge again as a fully Greek possession in 1881; in that year the reconvened frontier commission came to an agreement that granted Arta, with its surrounding area, and Thessaly to Greece, but allowed Turkey to retain both Ioannina to the north and Preveza a short distance to the southwest. This anomalous arrangement was finally resolved only in 1912.

Thus it can be said that the two periods of Arta's most notable contribution to the Hellenic tradition occurred initially under Pyrrhus, who first made the town his capital in the 3rd–2nd century BC, and later, as an independent Byzantine despotate, when it was able to express a vigorous individualism which was reflected in the outstanding range of buildings that can still be seen today.

Summary

The chief coastal town of Epirus, Arta was known as Ambracia in antiquity. The area was colonized by Corinth in the 7th century BC. Arta was the capital of Pyrrhus, king of Epirus in the 3rd–2nd centuries BC. In the Middle Ages it was an important Venetian trading post. From 1204 to 1479 it was the capital of the Despotate of Epirus.

Asia Minor Campaign and Disaster

1919–1922

The Asia Minor campaign and its culmination, the disaster of 1922, were the dramatic climaxes in the pursuit of the Great Idea (the reconstruction of the Byzantine empire), and important landmarks in the history of modern Greece. Their effects were far reaching: the centuries-old Greek populations of Asia Minor were uprooted, with horrific loss of life and property. The destitute refugees flooded into Greece and the word *katastrophi* (disaster) became synonymous with the Asia Minor affair.

In 1919, after the conclusion of the European war, the situation for Greece and the Greeks had appeared auspicious. Greece was sitting at the Peace Conference on the side of the victors; a general consensus appeared to exist among the victorious powers that the Ottoman empire (along with the German and Austro-Hungarian empires) would be dismembered or, at least, divided into spheres of influence; even more importantly, Greece had ethnographic grounds to support its own claims, grounds that were at the core of the Allied wartime declarations, including Woodrow Wilson's "Fourteen Points"; all this could only augur well for the Greek populations and for the realization of the Great Idea, the core of Greek policy over the previous 80 years. A further advantage for Greece was that it bordered the regions it claimed, a geographical advantage that no other power possessed.

The head of the Greek government was Eleftherios Venizelos, a statesman of international repute; but in 1919 the country was still deeply divided by the National Schism, and its constitutional order was irregular: Venizelos had come to power following an intervention of the Entente powers, and, as his opponents were saying, "by foreign bayonets"; king Constantine had left the country in 1917 without abdicating, appointing in his place his second son, Alexander; and Venizelos was ruling by means of a "resurrected" parliament elected in 1915, in which his supporters had a majority. On 29 March 1919 the Italians began to occupy the area of Adalia in southern Anatolia and to advance northwest towards Smyrna. Alarmed by this development, on 7 May the British prime minister Lloyd George, the American president Wilson, and the French premier Clémenceau, in the absence of the Italian delegation, authorized Greece to occupy the city of Smyrna and its hinterland, to protect the Christian populations of that city. The landing took place on 15 May, under the protection of Allied warships. The Greek occupation was not uneventful: the Greek troops were fired on by Turkish irregulars on arrival at the quays of Smyrna and Turkish guerrillas began raids on the Greek-occupied area. With atrocities occurring on both sides, military considerations made a speedy occupation of the Greek zone imperative.

By the autumn of 1919, the Greeks were well established, militarily and administratively, in Smryna and its vicinity, even though Turkish nationalist irregulars were harassing the Greek forces and the Christian inhabitants of the area. However, given the weakness of their opponents, the attacks were easily repulsed. The most difficult problem was the geographical boundaries in which the Greek army could operate, these being no more than 3 km outside the Greek zone. Within this limited

Asia Minor Disaster: Greek refugees fleeing before the advancing Turkish army, 1922

area, mopping-up operations continued throughout the rest of 1919 and during the first half of 1920. After the nationalist attack on the British garrison at Izmit in June 1920, however, the ban on operations was lifted (initially with the blessing of the Allied High Command in Constantinople) and the Greek army was allowed not only to pursue the attacking forces, but also to extend its zone of occupation inland.

The Greek territorial claims and the occupation of Smyrna were formalized in the Treaty of Sèvres, signed on 10 August 1920; it confirmed the Greek mandate for the Smyrna area from the Gulf of Adramyttio to Scala Nuova; the Greek zone was contiguous with a British occupation zone (to the north) and an Italian one to the south; the French were in Cilicia. The treaty was draconian for Turkey, which was limited to a small kernel in central Asia Minor; yet despite a comprehensive list of obligations, the open question was how Turkey would be compelled to accept and fulfil the terms of the treaty. Almost immediately it became clear that the Turks were not going to accept them; and that the Entente was collectively unwilling and even unable to enforce them militarily. The one power that was prepared to intervene militarily to enforce the treaty was Greece; however, its own resources, even if strained to the limit, were numerically insufficient for the task

The Greek landing in Smyrna and the Treaty of Sèvres caused considerable upheaval and reactions among the Turkish populations. Mustafa Kemal (later Atatürk) became the focus and organizer of resistance to the treaty. From central Asia Minor he organized two conferences of Turkish nationalists (in July and September 1919), both of which affirmed the rejection of the Sèvres treaty. The new Ottoman parliament, elected in November 1919, had a majority of nationalist deputies and was openly against the Treaty of Sèvres; the Allies dissolved it, but Kemal reconvened it in Ankara in April 1920, renamed as the Grand National Assembly. This became the supreme power for the Turkish nationalists, and soon the only power in Turkey.

In November 1920, following the death of king Alexander, Venizelos held elections in Greece; he was defeated decisively and left the country. This led to a series of resignations and the replacement of Venizelist officers from commands of units on the Asia Minor front. These included the replacement of general Paraskevopoulos, commander of the army in Smyrna, with general Papoulas. More importantly, the change in government resulted in a change in the Entente stance towards Greece: on 21 November 1920 the Entente issued a common declaration informing Greece that the return of Constantine to

the throne would result in the immediate cessation of financial aid and that the Allies would no longer assume any responsibility towards Greece. The restoration of Constantine gave the French and Italians the pretext they needed to distance themselves from their already shaky support of Greece and allowed them to effect a rapprochement with Mustafa Kemal's nationalists. Further adverse developments were also taking place: on 13 November 1920, in London, the French had suggested to the Allies the return of Smyrna to Turkey; on 20 November 1920 the Armenians capitulated and agreed to renounce their gains from the Treaty of Sèvres; while a rapprochement between the Turkish nationalists and the Soviets led to the signing of a treaty of friendship between the two on 3 March 1921. By the summer of 1921 the French and Italian military forces had begun evacuating the regions they were occupying, while their governments were vying with each other over supplying the nationalists; Mustafa Kemal had received large amounts of financial aid from the Soviets; and the British government had declared that it would remain neutral in the conflict. Despite these developments the Greek government and high command decided on a further push eastwards, which would later take the Greek army just short of Ankara, the capital of the nationalists. The campaign, which lasted until the end of August 1921, was only partly successful: the Turkish forces were generally pushed back and often defeated with many casualties and loss of equipment, but the Greeks failed to inflict a decisive defeat; long lines of communication and some war-weariness were also taking their toll. By September 1921 it was obvious that the front could not be held as it was; the Greek forces retreated westwards to a defensive line between Eskişehir and Afyonkarahisar. A military stalemate ensued with the front remaining stable until August 1922.

On the diplomatic front the Entente had attempted to find a solution to the stalemate in the summer of 1921, with little success. In February and March 1922 a further attempt was made, again with no success; both the Ottoman and the nationalist Turkish delegations insisted on the evacuation by the Greeks of both Asia Minor and Thrace before any further discussion could take place. The Greeks rejected this condition. The conference ended with the Entente proposals (modifications of the treaty of Sèvres and an autonomous status for Smyrna) given to the belligerents, but neither really accepting them. More importantly, Lloyd George, in meetings with the Greek delegation, encouraged the Greeks to seek a military solution to the issue. This was particularly welcome to the Greek government and in line with the Greek staff's confidence in the capability of the Greek army; the result was the Greek offensive of the spring and summer of 1921.

In October 1921 the French government signed the Franklin–Bouillon pact that recognized de facto the nationalists as the legitimate government of Turkey; the remaining French troops were withdrawn from Cilicia and arms and munitions (including 10 war planes) handed over.

In March 1922 the Entente made another attempt to find a solution to the stalemate; the proposals were more far-reaching than before, including changes in the demilitarized zone of the straits, evacuation of Constantinople by the Allied troops, a national homeland for the Armenians in Cilicia, and a League of Nations mandate for Smyrna; but the Greeks reserved their

5. Asia Minor campaign, 1919–22

reply to the proposals and the Turks rejected them, insisting once more on an unconditional withdrawal of the Greeks. All along, while Britain (particularly Curzon, the foreign secretary) was trying to find a solution, the other two members of the Entente, France and Italy, continued to supply Kemal's nationalists. In July the Greeks (in a veiled threat) asked for permission to enter Constantinople; they were refused and they did not move.

In the meantime Kemal's army was becoming stronger; and while the Greeks were not in any way inferior, general Hadjanestis, appointed in May 1922 as the new commander of the troops in Asia Minor, changed the organization of the Greek forces, centralizing command; his own headquarters were in Smyrna. Given the length of the front and the difficulties in communication, this was to prove a fatal mistake. On 26 August 1922 Kemal, from his headquarters a few kilometres behind the front line, launched a massive offensive and broke the Greek front between Afyonkarahisar and Savran. The Greek retreat was badly mismanaged and ended in several divisions being surrounded and having to surrender. By 8 September Smyrna was evacuated by the Greek troops; Turkish cavalry entered the city the next day. The evacuation of the Greek army from the Asia Minor seaboard was completed by 16 September 1922.

In Smyrna the departure of the Greek forces was to open a tragic page in Greek history. A wholesale massacre of Armenians and Greeks by regular and irregular Turkish troops was followed by the organized and systematic burning of the Armenian, Greek, and European quarters of the city. The toll was more than 25,000 dead. More than 200,000 destitute and panic-stricken people, mostly women and children, flocked to the shore, in a desperate attempt to find some means to leave.

Further atrocities took place there, in front of the foreign warships that were anchored in the Smyrna harbour. Among the dead was Chrysostomos, the Greek metropolitan of Smyrna, who was cut to pieces by the Turkish mob in front of a French marines patrol. A few days later, Nureddin, the Turkish military commander, issued a proclamation by which all Greek and Armenian men aged between 18 and 45 were rounded up and taken inland, to work in the notorious *amele taburu* (work battalions); most did not return. The remaining Greeks and Armenians were given until 30 September to leave; if they did not, the proclamation continued, they would "be considered suspect of threatening the security of the army and public order" and deported. Similar scenes of looting, destruction, massacre, and deportation were repeated in other towns and villages of the coast where Greek populations were living.

British intervention (which France grudgingly agreed to support) resulted in an armistice signed in Moudania on 11 October 1922. Greece had to evacuate eastern Thrace and withdraw west of the Mariza (Evros) river. Following this decision, the Greek population of eastern Thrace abandoned their homes and followed the Greek army into Greece. The region was handed over to the British authorities who, in turn, handed it to the Turkish nationalist representatives on the same day.

The results of the Asia Minor campaign were confirmed with the Lausanne treaty, which finalized the end of the Greek dreams, killing with them the Great Idea. As a result of the disaster and the Treaty of Lausanne, 1.5 million Greeks left Turkey for Greece, exchanged for 350,000 Muslims who left Greece for Turkey. The compulsory exchange of populations made Asia Minor, along with eastern Thrace, Pontus, and later Imbros and Tenedos, part of what became known in Greek as the *chamenes patrides* (lost homelands).

Astrology

Astrology is a pseudoscience that uses astronomical phenomena to make mundane predictions. Its origins lie in Mesopotamian astral, planetary, and meteorological omens, which were being catalogued already in the 2nd millennium BC in the cuneiform text *Enu-ma Anu Enlil* (much of its material is to be found in later Greek manuals such as those of Ptolemy, Hephaestion of Thebes, and John the Lydian in the 2nd, 5th, and 6th centuries AD respectively). Although it was not at first true astrology, in so far as there was no suggested relationship of cause and effect, increasingly exact astronomical observations from the 7th century BC encouraged the Babylonians to extend their science to making predictions for individual humans. By the late 5th century this Babylonian protoastrology had penetrated a Greek world made receptive through its divinization of celestial bodies. Greeks are responsible for its complex developments made chiefly in the period *c.*300 BC – *c.*AD 300.

Astrology is dependent upon a belief in sympathetic magic, which postulates a link between the macrocosm (universe) and the microcosm (man). It is based upon the supposed characteristics and associations with mundane phenomena of the seven "planets" (Sun, Moon, Saturn, Jupiter, Mars, Venus, and Mercury) and the twelve constellations of the zodiac, the latter being groupings as seen from earth of unrelated stars in a moving band eight or nine degrees each side of the ecliptic (the apparent course of the sun's annual orbit). The attribution of characteristics and associations to celestial bodies has on rare occasions a vestige of reason: thus Saturn, whose orbit is furthest from the sun of the planets known to the ancient world, was considered cold and malign, the cause of freezing weather, pestilences, and scarcity, and in man of dysentery, colic, the bringing up of phlegm, elephantiasis, etc. More typically, however, his lordship over the right ear (like Mercury's over the buttocks) appears quite arbitrary. Other associations depend upon contemporary theories: for instance, Pythagorean mathematics, by classifying all even numbers as female, dictates that Taurus (the Bull), since it is the second sign of the zodiac, should be female.

The "planets" were seen as moving anticlockwise at various speeds against the zodiacal circle, which itself revolved clockwise against an envisaged stationary circle whose four cardinal points were those of the risings and settings on the horizon of the ecliptic and the zenith and the nadir. This second circle was divided into usually 12 segments or "places" (today commonly "houses"). The degree of influence on mundane phenomena of each celestial body was believed dependent upon its position in respect to other bodies (its "aspects") and its "place", but there

were so many calculations of often contradictory evidence that failure of predictions could easily be explained away. This was even more possible with the addition of the *dodecatemoria*, the division of each sign of the zodiac into 12 equal parts of two and a half degrees, each assigned to one of the 12 signs of the zodiac and thus allowing a "planet" to be in, say, the *dodecatamorion* of Scorpio in the sign of Gemini. All astrologers tended to base their predictions upon tables rather than observation, despite the accurately calculated discovery by Hipparchus in the late 2nd century BC of the precession of the equinox (the retrograde movement of the equinoctial points along the ecliptic), and thus continued to work on the assumption that the vernal equinox occurred at the first point of Aries rather than at some point in Pisces.

Believers were divided into those who, through acceptance of a purely mechanistic universe, held that the celestial bodies dictated an ineluctable fate and those who believed that astrology merely gave clues to personalities and trends and whose role was therefore that of a guide. The commonest application of astrology was for genethlialogy in which predictions were made about an individual on the basis of celestial positions at the hour of his birth or, far less commonly and of course less accurately calculated, his conception. These predictions could be updated by anniversary horoscopes. Large numbers of often astronomically impossible horoscopes have survived on papyrus, while there is one more "scientifically" reputable ancient collection from *c.*AD 130 in the *Anthologies* of the Antiochian Vettius Valens. Catarchic astrology determined the most favourable moments for commencing various enterprises such as journeys and military campaigns. Largely a subdivision of this was iatromathematics which dictated when certain herbs should be picked for greatest efficacy, predicted the course of illnesses, and gave clues as to treatment. Interrogational astronomy was dependent upon the positions of the celestial bodies at the time of the question.

Philosophical underpinnings to Greek astrology gave it respectability. Thus even the supremely competent astronomer Claudius Ptolemy in the 2nd century AD accepted and, indeed, even wrote a textbook (*Apotelesmatika* or *Tetrabiblos*, Astrology or the Fourfold Book) on the subject. Opposition was largely aimed at quack practitioners and those who threatened the stability of the state by making public predictions of the death of its ruler. Stoics, with the notable exception of Panaetius, were particularly drawn to astrology by their belief in cosmic sympathy, and in the early 1st century AD Manilius wrote a didactic poem (in Latin) on the subject. Epicureans and Cynics, however, scoffed at it. The most detailed surviving refutations are those of the Sceptic Sextus Empiricus in the 2nd century AD and of Plotinus and Origen in the 3rd century AD. Since astrology offended the concept of man's free will, Christian opposition was at times virulent but could not entirely extirpate it owing to belief in the "star" that led the Magi to Bethlehem. The 4th-century Priscillianist heretics in Spain even went so far as to hold that God used the celestial bodies to make manifest his will.

Hellenistic astrology passed through Sanskrit translations (most notably the *Yavanatjataka*, Sphujidhvaja's versification of Yavaneśvara's translation of AD 149/50) to India, where it was modified to accommodate local beliefs. Sassanian Iran learned its astrology from both Greek and Indian sources and, before it passed it on to the Islamic world, added another type, the political, wherein predictions were made for whole nations.

Knowledge of astronomy almost completely died out in the Latin west through the non-existence there of astronomical tables. It continued, however, in Byzantium, beginning with an iatromathematical treatise on bed-illnesses by Pancharius, but in the period from the 4th to the 7th century it consisted of little other than compendia of Hellenistic material. Translations from Arabic began shortly before the year 1000 and introduced political astronomy. Belief was strongest probably during the 12th century when it was enthusiastically promoted by the emperor Manuel I. Both Arab and Byzantine astrologers were in consultation over the malign conjunction of planets on 16 September 1186, the elaborate attempts to protect the imperial palace from whose threat were mocked by Niketas Choniates. The Palaiologan period saw vast compilations of both Arabic and especially earlier Greek material, the latter of which was sometimes revised.

Knowledge of Greek astrology returned to the west from Islamic Spain by the 12th century. Astronomical discoveries in the 16th and 17th centuries undermined its validity, although most astronomers still retained belief in it and Johannes Kepler attempted to accommodate it to a heliocentric universe. Any intellectual basis for belief was finally eradicated by Newtonian physics (despite his own dabbling with horoscopes). Thereafter one of the most ingenious creations of the Greek mind has retained only a popular following, which has predictably been strongest at periods of crisis and disillusionment with established institutions both religious and political.

Astronomy

Greek astronomy can be defined as the astronomy of epicycles, an invention of the 3rd century BC. To arrive at this solution for planetary movements, the astronomers of the 3rd century had behind them three centuries of observations and mathematical theories.

Little is known about the mathematical astronomy of the Presocratics. Thales of Miletus (7th–6th century BC) is considered to be the first Greek astronomer. He predicted solar eclipses by studying their periodic recurrences, but with an important factor of error. Anaximander (6th century BC) observed the inclination of the ecliptic. Pythagoras (6th–5th century BC) found the "right" (in the geocentric system) order of the planets (Earth, Moon, Mercury, Venus, Sun, Mars, Jupiter, Saturn, while Aristotle later placed the Sun between the Moon and Mercury). A little more is known about the contemporary of Socrates, Meton, who, observing from the hill of Pnyx about 432 BC, defined the solar–lunar cycle of 19 years.

The observational data (especially those concerning the retrograde planetary motions and Sun and Moon anomalies) were important enough in Plato's time for him to pose the problem of "saving the phenomena" (interpreting celestial bodies' motions by circular orbits with uniform speed). According to Simplicius (6th century AD), it was Eudoxus who produced that system, composed of homocentric spheres. The combination of two spheres rotating with unchanging velocities can effectively represent the retrograde planetary motions. For the motion of the Sun he employed three spheres (one to account for an observation known to have been mistaken), and another three for the Moon.

Eudoxus' system only partially saved the phenomena: in particular it did not take into account the variations in the distance of the heavenly bodies (the variation in the apparent diameter of the Sun or in the brilliance of the planets). This problem was posed during the 3rd century BC. The heliocentric system proposed by Aristarchus of Samos (4th–3rd century) was an adequate response to that problem but, probably for philosophical reasons, it was not followed by the main Greek astronomers. According to a later source, Theon of Smyrna (2nd century AD), a system had been proposed during the 3rd century BC similar to that imagined 19 centuries later by Tycho Brahe. In that system the two "inner" planets, Mercury and Venus, orbit the Sun, while the latter orbits the earth, the centre of the universe. This system resolved far better than that of Eudoxus the motion of Mercury and Venus; it is highly probable that it is the origin of the astronomy of epicycles. Indeed, if the orbit of the Sun is replaced by the deferent cycle of Mercury and Venus, the solution attributed to Apollonius of Perge (born *c.*244 BC) is reached.

In an effort to respond to the solar anomaly, while respecting the principle of circular uniform motion, 3rd-century Greek astronomers proposed the "eccentric" solution: the Sun travels on an eccentric circle (centred on a point that does not correspond to the earth's centre). This system presented two difficulties: it was not symmetrical and it was contradictory to Aristotelian physics, which could not accept a motion around an imaginary point. It was probably Apollonius who resolved the problem of symmetry, by demonstrating the equivalence of an eccentric to an epicycle travelling around a concentric (deferent circle), while the "Aristotelian" problem has never been resolved. This epicycle plus deferent solution was to characterize all the astronomical systems until the beginning of the 17th century, when Kepler formulated his first planetary law, that of the elliptical orbits.

Between Apollonius and Hipparchus (who was observing at Rhodes *c.*128 BC), Greek astronomers had developed a complete epicycle plus deferent astronomical theory. By combining the radius and the motions (clockwise or anticlockwise), these astronomers could reproduce the retrograde motion of the planets (but not the fact that the "loops" produced by this motion were not symmetrical) and represent approximately the Sun's and the Moon's motion.

By reversing the "methodological" approach of astronomy, Hipparchus played a decisive role in the development of Greek astronomy. According to available information, which comes mainly from Ptolemy, Hipparchus was the first to give priority to the collection of observations in order to find the empirical laws of the motion. After that, he tried to solve the problem by circular uniform movements. Hipparchus tried to determine the radii of the deferents and the epicycles of the planets and computed a successful theory for the motion of the Sun. He also showed how to calculate the Moon's motion; his work was masterfully completed by Ptolemy.

As for the Sun, Hipparchus determined its eccentricity, resolving thus its principal anomaly, that of the inequality of the seasons' length. It was probably while working on the theory of the Sun that he made his main discovery, that of the precession of the equinoxes. By comparing historical observations, Hipparchus remarked that, in its annual movement, it took the Sun a little more time to reach the same zodiacal point than to reach the equator: the sidereal year would then be different from the solar year. This phenomenon, due to the spinning-top movement of the axis of the earth, was interpreted by Hipparchus as a very slow movement of the sphere of the stars, from west to east (about 1 degree per century, while the true value is 1 degree, 23 minutes, 30 seconds).

As for the Moon, the problem was much more complicated, as the motion of the earth's satellite presents six main anomalies. Although Hipparchus knew only one, he did not succeed in resolving it, but he posed the problem of the parallaxis relating to solar and lunar observations: he said that astronomers must consider the earth as a point only with respect to the fixed stars. He also tried to determine the dimensions and the distances of the heavenly bodies.

The apex of Greek astronomy was the magisterial work of Claudius Ptolemy. His book, the *Great Mathematical Syntaxis of Astronomy*, known as the *Almagest*, finished between AD 142 and 146, included all the astronomical phenomena known at that time. This book constituted a unique advance in the history of science: it was to be the main reference for all astronomers until the work of Tycho Brahe and Kepler, almost 1500 years later. Indeed, all Greek, Islamic, or Roman planetary astronomy until Kepler can be characterized as Ptolemaic.

Ptolemy continued and concluded Hipparchus' work. His method was similar: to collect as many observations as possible; to show up the anomalies of the planetary motions; to find the empirical laws for these anomalies; to combine various circular uniform movements in order to save the phenomena;

to choose the most adequate among the different solutions, and determine the radii and the positions of the circles and the angular speeds; to compute the planetary tables. The coincidence of forecast with observation confirmed the theory.

The main celestial movements according to Ptolemy were the following two: (a) the diurnal motion of the sky from east to west; (b) all other motions, which mainly took place from west to east and close to the ecliptic. Whenever Ptolemy was able to choose from among many solutions, he preferred the simplest. He adopted Hipparchus' solution for the Sun, but for reasons of simplicity he chose the eccentric from the deferent plus epicycle. For all the other heavenly bodies he presented his own solution, which in the case of Venus, Mars, Jupiter, and Saturn involved the famous "equant" (it was given this name during the Middle Ages): the centre of the epicycle does not move with a uniform motion; the circular uniform motion is "transferred" to a point of another circle (the equant). As a consequence, the phenomena were saved (the planets travel faster at their perigee and more slowly at their apogee), but this represented a serious departure from Aristotelian physics and from the principle of uniform circular motion posed by Ptolemy himself. The system was also extremely complicated: Ptolemy even added circles to move the level of the epicycle from that of the deferent!

Ptolemy presented his cosmological speculations (the mechanisms responsible for all the motions of the heavenly bodies) in his book *Planetary Hypotheses*. This work was the precursor of Islamic astronomical theories on the mechanisms of the celestial spheres. Another astronomical work of Ptolemy, the *Handy Tables*, a revised version of the *Almagest*, remained in use throughout the Middle Ages.

The main Greek commentator on Ptolemy was Theon of Alexandria (4th century AD). His commentary on the *Almagest* and two commentaries on the *Handy Tables* were the last important works of ancient Greek astronomy. In the 6th century John Philoponus wrote the first known *Treatise on the Astrolabe* (*c.*520–50), based on an unknown source. The first Byzantine astronomer of any note is considered to be Stephanus of Alexandria. He wrote a *Commentary on the Handy Tables* (*c.*610–20) inspired by the *Small Commentary* of Theon, a work designed for students unable to do multiplication and division.

Little is known about astronomy during the iconoclast period (except for some astrological works such as that of a certain Stephanus, written about 775, with previsions for the Muslim dynasties). The 9th century, however, is marked by the personality of Leo the Mathematician, and by the splendid copies made of Ptolemy's and Theon's works. These copies secured the transmission of the great astronomical works of antiquity.

The first indication of the influence of Arab astronomy on Byzantium dates to about 1032: an anonymous marginal commentary comparing Ptolemy's astronomy with that of the "moderns" (i.e. the Arabs, and especially the astronomer al-Alam). About 1072–78 another anonymous treatise introduces pure trigonometric methods in astronomy, inspired by the work of Habash al-Hasib. During the 12th century the works of Ptolemy were translated into Latin in Sicily, from Greek manuscripts offered by the emperor of Byzantium to the king of Sicily.

The great period of Byzantine astronomy began at the end of the 13th century, during the reign of Andronikos II Palaiologos. There were two main streams of thought: that of the renaissance of Ptolemaic astronomy and that of the foreign influences.

Theodore Metochites, "Grand Logothete" (the equivalent of prime minister), finished *c.*1316 a monumental astronomical work, the *Elements of Astronomy*. His pupil Nikephoros Gregoras (*c.*1290–1358) introduced Byzantine scholars to the practise of computing eclipses based on Ptolemy's method. Theodore Meliteniotes (*fl.*1393) wrote the *Astronomical Tribiblos*, a huge treatise restoring Ptolemy's astronomy among others.

At the end of the 13th century the physician Gregory Chioniades travelled from Trebizond to Tabriz to study Persian astronomy (the Maragha was then the world's most famous observatory). He brought back knowledge and manuscripts which, in 1346, were translated into Greek by George Chrysokokkes whose work, *Introduction to the Persian Astronomical Syntaxis*, was one of the most frequently copied Byzantine astronomical texts: more than 40 copies have survived. Maragha's astronomy was transmitted to Europe by means of Greek translations; Copernicus based his astronomical system on the "Al-Tusi couple", which he probably knew from a Greek manuscript. Another foreign influence on Byzantine astronomy was that of the Jews. In 1435 Michael Chrysokokkes translated Immanel ben Jacob Bonfils de Tarascon's tables of eclipses (*Ioudaikon Hexapterygon*). The *Alphonsine Tables* were also translated into Greek, first in Cyprus (*c.*1340) and then in Constantinople by Demetrios Chrysoloras (*c.*1360–*c.*1416), a high-ranking Byzantine official.

The last Byzantine astronomer was the philosopher George Gemistos Plethon (*c.*1360–1452); his Hellenic patriotism, mysticism, and late contact with the West encouraged him to propose an extremely original calendar reform.

The next important Greek astronomical work was the 16th century adjustment of the tables of *Ioudaikon Hexapterygon* by Damaskinos Stoudites, archbishop of Arta and Lepanto. From the 17th century only very simple manuals presenting the main lines of Ptolemaic astronomy survive. At the end of the century Chrysanthos Notaras (later patriarch of Jerusalem) adapted, probably from Persian, the main astrolabe problems and in 1716 he edited in Paris the first Greek printed book presenting non-Ptolemaic astronomy. As late as 1748 an important text for the history of the astrolabe was printed, "Peri Astrolavou" (On the Astrolabe, in *Odos Mathimatikis*), written by Methodios Anthrakistes some years earlier. This work is considered to be the last text of the Greek tradition concerning the construction of the astrolabe. Newtonian astronomy was introduced in the Greek communities of the Ottoman empire after the second half of the 18th century. Nikiphoros Theotokis was one of the main scholars professing the "new astronomy" in the Greek colleges. Textbooks such as the Lalande's *Astronomy* were published at the very beginning of the 19th century.

Observational astronomy was to revive in Greece in 1842, when Simon Sinas founded the Athens Observatory near the place where Meton had once observed. There Julius Schmidt drew his famous lunar maps. He was the only foreign

astronomer, for very soon Greeks, who had previously studied in European observatories, began to run the institution following international standards.

Athanasios of Athos, St *c.*927/30–*c.*997

Founder of the first Athonite monastery

St Athanasios, who became known as the Athonite, was born in Trebizond in Asia Minor and was baptized under the name of Avramios. He came from a wealthy family, but having lost both of his parents at an early age, his upbringing was entrusted first to a nun who was a relative of his, and, after her death, to a eunuch who was related to the emperor Romanos I Lekapenos (920–44). He was educated in Constantinople and, after spending some time teaching there, he abandoned the secular world and entered the monastery of Kyminas in Bithynia where the abbot was Michael Maleinos, the uncle of Nikephoros II Phokas (963–69). When Nikephoros marched against the Arabs in Crete, he asked Athanasios to accompany him. Athanasios, who then was a monk on Mount Athos, accepted the invitation and lived in Crete until 961 when the island regained its independence. Nikephoros also gave Athanasios a considerable sum of money in order to build up a monastery, where he himself intended to become a monk at a later date. Thus, Athanasios founded the monastery of the Great Lavra in 963. It was the first monastery to be established in the territory of Mount Athos and today it still holds the leading position in the ranking of Athonite monasteries. It should be pointed out, however, that before Athanasios's time the eremitic type of monasticism, combined with some form of communal life but loosely organized, had already existed on Athos. But Athanasios inaugurated the cenobitic form of monastic life under a central administration, because he realized that the poor sketes could not give a home to a long-lived monastic tradition. With imperial support the Lavra was granted annual revenue and lands and Athanasios initiated large-scale construction.

Quite soon, however, Athanasios faced the condemnation of some Athonite ascetics, who blamed him for abandoning their cherished monastic traditions and the concept of the "poor monastery" and for secularizing Athos. Yet, both the ascetics and emperor John I Tzimiskes (969–76), the successor of Nikephoros, soon came to realize that such innovations were not new inventions, but simply the continuation of the old and well-established tradition of cenobiticism in the east. A consequence of these disputes was the creation of the Typikon (rule) of the Great Lavra, which came to be known by the name of *Tragos* (972). This document, composed by order of Tzimiskes, contained the reforms of Athanasios. Thus for the first time on Athos there existed a book of rules concerning the internal organization of monasteries. In addition, through this Typikon Athos was recognized as an independent monastic polity. In it Athos is referred to not simply as the Mountain, as it used to be called up to that point, but as the Holy Mountain, a name that was officially acknowledged later on by emperor Constantine IX Monomachos (1042–55). From then on, Athanasios became the spiritual leader and reformer of Athonite monasticism. Even today he is regarded as the father and patriarch of all Athonite monks, because his reforms contributed to the establishment of cenobitic monasticism and to the subsequent flourishing of Athos. Consequently, the celebration of the millennium of the foundation of the Great Lavra in 1963 coincided with that of Orthodox monasticism on Athos.

The contribution of St Athanasios to the Greek Orthodox monastic tradition is immense. Although the monastic tradition of lavras no longer existed in Byzantium, he instigated on Athos the creation of a cenobium on which a small number of monastic cells depended. His reforms were endorsed by all subsequently created monasteries on Athos and elsewhere. It is also worth mentioning that Athanasios introduced into his monastery new time-saving devices, such as a machine driven by oxen to prepare dough.

Athanasios died on Athos probably in 997, for his signature appeared in the "Acts of Lavra" for the last time in October 996. The first biographies of Athanasios were composed in the third decade of the 11th century.

Athanasius of Alexandria, St *c.*300–373

Pope of Alexandria

Athanasius first appears on the scene of history as the deacon of Alexander, the pope of Alexandria, at the First Ecumenical Council of Nicaea in 325. Of his early years we know nothing, though from his writings we can deduce that he was not a product of the formal system of education in late antiquity, but nonetheless had a good command of Greek, and an adequate familiarity with the ideas of the Classical and Hellenistic philosophers: he revered Plato as "that great one among the Greeks [i.e. pagans]". All this is consistent with the suggestion that he received his education among protomonastic ascetic circles in Egypt. As a young man, he must have caught the eye of Alexander and attached himself to his circle. In 328, having barely reached the canonical age of 30, he was elected bishop of Alexandria (or "pope", the traditional title for this post) to succeed his mentor. The election was contested, and perhaps not just because of his age. He continued Alexander's opposition to the Alexandrian priest Arius, who had been condemned at the First Ecumenical Council for denying the unqualified divinity of Christ, and was embroiled in the Meletian schism, a legacy of the great persecution at the beginning of the 4th century. He remained pope of Alexandria until his death in 373, though in the course of his life he was deposed several times and exiled four times. His position in the history of the Christian Church is bound up with his sustained opposition to those bishops in the east, and to the emperors whose support they secured, especially Constantius II, who were unwilling to endorse the creed (or symbol) of the Council of Nicaea and sought to replace it with a series of creeds all endorsed by conciliar authority, and with the eventual victory of what has come to be called "Nicene orthodoxy", though he did not live to see the Second Ecumenical Council (held at Constantinople in 381), called by the emperor Theodosius to reinstate the authority of Nicaea. He pursued this struggle through his many writings against those he somewhat unfairly dubbed "Arians" or "Ariomaniacs", some of which tell the history of the struggle, others of which assert the authority of bishops, not emperors, to define Christain doctrine and govern the Christian Church. Even within his lifetime Athanasius was regarded by many with awe, and his dominant position is reflected in all the surviving church histories of the 4th century.

Athanasius' importance is found, first of all, in his championing of Nicene orthodoxy, which formally became the religious orthodoxy of the Byzantine empire in 381. Central to this is the confession that the Son of God, who became incarnate in Jesus of Nazareth, is consubstantial (*homoousios*) with the Father, that is, of the same unqualified divinity as the Father. He also, in his latter years, defended the divinity of the Spirit, and therefore the doctrine of the Trinity. But, more generally, in Athanasius' thought we find, perhaps for the first time, the pattern and the essential themes that were to characterize Byzantine theology: the doctrine of a consubstantial and coequal Trinity; the doctrine of the creation of the universe out of nothing through the Word of God, the second person of the Trinity, and of humankind's special role within the cosmos as being created in the image of God; the idea of the fall of humankind, through human disobedience, a fall that has cosmic implications; and the conviction that, through the assumption of a human life, the Word of God has redeemed humanity by conquering death and revealing the risen life through his resurrection, and has not only redeemed humanity, but promises deification (*theopoiesis* or *theosis*, a sharing in the divine nature) to all those who believe and strive to conform their lives to his through ascetical struggle and sacramental grace. All this is stated with amazing conciseness in his early work, *On the Incarnation*. Later Byzantine theology would explore the intricacies of this grand vision, but not alter its broad outline, with its main span reaching from creation to deification. A further dimension to Athanasius' importance is the strong link he forged between his hierarchical office and the emerging monasticism of the 4th century. This is symbolized in the ascription to Athanasius (an ascription that has been questioned in recent times, but is probably still sound) of the *Life of St Antony*, the great Egyptian hermit. The *Life of St Antony* became the pre-eminent model for the saint's *vita*, the most popular form of literature in the Byzantine world. This work, in which Athanasius embraces the characteristic demonology of the Fathers of the Desert (something otherwise rare in his writings), and his other ascetical writings (many of which survive in Coptic, Syriac, or Armenian) make clear the depth of Athanasius' commitment both to the monastic movement and to the more traditional urban and village asceticism that he also took steps to organize.

ANDREW LOUTH

Biography

Born in Alexandria *c.*AD 300, Athanasius received a good education and had some knowledge of the Classical philosophers. Elected pope of Alexandria at the age of 30, he was five times deposed and exiled. He championed orthodox Christianity against the heresy of Arianism. Other surviving works include a treatise *On the Incarnation* and (of uncertain authorship) the *Life of St Antony*. He died in Alexandria in 373.

Atheism

Atheism conventionally refers to a system of belief that denies the existence of a personal divinity. Taken in this sense, it is of fairly recent coinage in Greek intellectual history. In a broader sense, however, atheism, taken to refer to godlessness or, polemically, to the rejection of particular religious beliefs, has a better-documented pedigree.

Atheos is the Greek for "atheist". This is etymologically an adjective of broad application designating most frequently godlessness or the denial of a particular set of divinities. Thus, for example, in the *Eumenides* by the Athenian playwright Aeschylus, Orestes is called *atheos* because contrary to religious convention he had murdered his mother Clytemnestra, although his conversations with Apollo necessitate his belief in the existence of gods. Likewise, in *Oedipus the King* by Sophocles, the chorus protests its loyalty to Oedipus by wishing to be abandoned by friends (*aphilos*) and gods (*atheos*) alike if it wishes any ill towards him.

The number of known atheists in antiquity is very small. Though the historical record is somewhat fragmentary in most instances, during the latter part of the 5th century BC Athens witnessed a small number of piety trials directed against natural philosophers, who were commonly perceived as atheists. These early scientists became objects of legal persecution largely because of their attempts to substitute natural causality for divine intervention. Diagoras of Melos is traditionally known as "the atheist" although the evidence indicates that he did not reject the existence of all gods. Anaxagoras was more clearly atheistic in his outlook since he specifically rejected the divine nature of the sun by referring to it as a piece of "hot stone". Protagoras held a more ambivalent position by proclaiming his uncertainty one way or the other as to the existence of the gods. Most famously, Socrates was tried and executed in 399 BC because he allegedly rejected the state divinities, introduced new gods, and corrupted the youth. The truth of these charges is unknowable, but three aspects of the case are significant. First, Socrates was represented in the *Clouds*, a comic play by Aristophanes, as rejecting the gods in favour of apotheosized natural mechanisms. Second, in Plato's *Apology*, a fictitious representation of his defence speech, Socrates specifically denies the charge of atheism, thereby demonstrating his vulnerability on that very point. Third, he is represented by the relevant witnesses as possessing a personal oracle, known as the *daemonion*, and observing the religious customs of his day, thus leaving him vulnerable to the charge of introducing new gods. Obviously, the atheism of Socrates was not the religious nihilism of the modern era.

Subsequent to Socrates, it is possible to speak of atheistic beliefs within a broader Graeco-Roman context. The Epicurean school of philosophy with its strict materialism and denial of divine intervention in human affairs is chiefly associated with these ideas. The Roman poet Lucretius, writing in the 1st century BC, aimed to popularize this particular outlook with his epic poem *On the Nature of Things*, a spirited challenge to the religious beliefs of his day. Plutarch, who lived during the last half of the 1st century and first half of the 2nd century AD, in his book *On Superstition*, gives atheism a very modern sense, saying that it is a denial of the existence of gods, but adds that it results from spurious reasoning. Doubtless the agnosticism of Marcus Aurelius, the Stoic emperor who reigned AD 161–80, easily falls within the bounds of ancient atheism. Lucian, a contemporary of Marcus Aurelius, describes in his *Icaromenippus* several schools of thought about the nature of the divine, some of which are atheistic, whether in the ancient or the modern sense

Christians, because they rejected the religious norms of their contemporaries and refused to yield in their monotheistic views, were regularly persecuted for their atheism. Lucian relates how Alexander of Abunoteichos, a spiritual mountebank, incited his followers to stone the Christians because they were blaspheming atheists. For their part, Christians enthusiastically labelled non-Christians and various sectarians as atheists. For example, in his Letter to the Ephesians Paul says that before the coming of Christ the gentiles were "without hope and atheists". According to Clement of Alexandria in his *Exhortation to the Greeks*, Diagoras and others who were in his view rightly sceptical about traditional Greek religion were not atheists; rather the true atheists were those who upheld pagan religious norms. The Christian apologist Athanasius refers to those who do not share his views on the relationship between Jesus Christ and God as atheists and non-believers. Polemical allegations of atheism aside, it appears that no evidence for intellectual atheism during the late antique period

survives. As one writer has noted of this time, "sceptics and rationalists, if they existed, have left no mark on history and literature" (Jones, 1964, vol. 2, p.957).

Christian polemicists within the Greek Orthodox Church appear to have been just as tendentious in their application of the term "atheist" as their ancient predecessors. *Planosparaktes*, an anonymous 18th-century poem, is an example of this. In it a certain Auxentios, a miracle-working monk murdered in 1752, is called an atheist because of his support for the patriarch Cyril V, whose controversial views on the baptism of former Roman Catholics resulted in his being deposed twice from his see.

The latter part of the 18th and early part of the 19th centuries mark a period when leading intellectuals, influenced by exposure to the Enlightenment in western Europe, began to confront a Church hierarchy that was far too supportive of the Ottomans. In this context appears the *Ellenike Nomarchia*, a sustained and vigorous attack on the Orthodox Church and the Church's condemnation of Beniamin Lesvios in 1804 for teaching that the earth revolved around the sun, to cite two examples of the level of controversy. The *Didaskalia Patriki* of 1798 surely ranks as paramount among Church apologetics directed against the perceived atheistical tendencies of the French Revolution and its intellectual underpinnings. Concerned about the revival of Classical learning and growing interest in Enlightenment thought, the patriarchate reopened its presses to ensure the publication of doctrinally sound material.

The impact of Marxism and its explicitly atheistic outlook must also be noted. During the Civil War of 1946–49 it is said that a sizeable number of Orthodox priests and monks were executed by members of the far left. In the Eastern bloc countries the constraints of Communism were likewise felt. Thus the Orthodox Church in Bulgaria was forced to make certain concessions in order to retain a slightly privileged status under the regime there.

Athenaeus

Prose writer of the 2nd century AD

Athenaeus was born in Naucratis, a Greek community in Egypt, around AD 150. He was prominent among the Greek scholars of the so-called Second Sophistic, and but one of several produced by Naucratis. These scholars, Athenaeus included, were concerned with the revival of Classical Greek culture in the context of Roman imperial rule. Athenaeus spent time in Rome in the patronage of P. Livius Larensis, a cultured Roman bibliophile with a strong interest in Hellenism. However, there is no evidence for the frequent assertion that he belonged to the circle of Julia Domna, the wife of the Roman emperor Septimius Severus.

His principal work was his *Deipnosophistae*, (Sophists at Dinner). It is divided into 15 books (not 30, as sometimes claimed), of which the opening and closing books are fragmentary: for these, we depend largely upon an epitome. The *Deipnosophistae* forms part of a long Hellenic tradition of sympotic literature, a direct descendant of Plato's *Symposium*, Xenophon's *Symposium*, Plutarch's *Sympotic Questions*, and Lucian's *Symposium*, among other texts. However, it is far longer than these predecessors. The diners, 24 in total with the host Larensis included, discuss both the dinner itself and a bevy of issues that arise from particular dishes or circumstances – cooks (Greek and non-Greek), extraordinary concoctions, outstanding banquets, dances, music, musical instruments, furniture, wines, health, cultivated fruits, gluttony, austerity, luxury, scholarship, and humour.

Each diner receives his own characterization, but some are more strongly drawn than others. They include Ulpianus of Tyre, committed to the purity of Attic Greek and always concerned to raise a pedantic point of grammar (and probably not to be identified with Ulpian the jurist); Kynoulkus, a Cynic who takes pleasure in goading the irascible Ulpian; Galen the physician; Masourius, with pretensions to musical expertise; Ploutarchus, a grammarian; and Myrtilus with his taste for proverbs. How far these characters are real people in Larensis' circle remains a matter of doubt: Athenaeus has been suspected of sly humour in his construction and naming of the diners. Certainly, humour is a pervasive feature of the *Deipnosophistae*, both in the interaction of characters and in the dubious and often overblown learning in which the diners compete. The *Deipnosophistae* is best read as a work of both philosophy and satire, appropriately enough in the sympotic tradition.

Athenaeus' work has most often been used as a source for earlier Greek dining or for lost texts, which are quoted very extensively throughout. Its thematic division (e.g. book 7 on fish; book 13 on courtesans) encourages the former approach, while the sheer density of quotation makes the latter inevitable. In accordance with the humorous tone of the work, quotations from Greek comedy are particularly frequent and constitute an enormous part of our knowledge of the genre. Athenaeus' quotations are drawn from some 1250 authors: they include the titles of some 1000 plays and run to some 10,000 lines of verse. The combination of verse quotation and prose text indicates Athenaeus' debt to the genre of Menippean satire.

However, Athenaeus also quotes heavily from prose works, as well as from verse. For example, the historian Callixinus' lengthy account of the grand procession of Ptolemy II Philadelphus is preserved in the *Deipnosophistae*. Athenaeus displays through his characters a historical sensibility far beyond that of an antiquarian. In particular, although his work focuses especially upon Greek culture in its broadest sense, there is also a recurrent concern with the contemporary historical situation, with Rome and its emperors (8. 361f on Hadrian; 12. 537f on Commodus). Moreover, the most recent scholarship encourages the suspicion that Athenaeus not only preserved quotations, but also inserted his own additions and emendations: in any event, it is often difficult to be sure where quotation ends and Athenaeus' own writing begins. There is also an uncomfortable inconsistency in the details of the setting: the first ten books seem to relate to a single banquet, books 11–14 indicate a second gathering, while the final book 15 contains a third session, the whole covering three successive days, it seems. The dramatic context has been taken to range inconsistently between January (9. 372b), April (8. 361f), and August (3. 99e), whether by authorial error or in consequence of the manuscript tradition. However, although January and August are mentioned in the text, it is only 21 April (the ritual "birthday" of Rome) that is clearly given as the time of the dinner(s).

Athenaeus mentions two further works of his own in the course of the *Deipnosophistae*. Neither survives, but both represent features of the concerns that he displays in the extant work. One may be regarded as a historical work in view of its title, *On the Kings of Syria* (*Deipnosophistae*, 5. 211a). However, the rulers of Syria, who might include not only the Greek Seleucids but even Semiramis, offered ample scope for a wealth of anecdote, humour, and moralistic philosophizing, so that the work may not have been the solid historical text that has often been imagined. Certainly, the short passage quoted in the *Deipnosophistae* suggests that its tone may not have been so very different from that of the extant work. Athenaeus' other work survives only as a title: it was a treatise on Archippus' comedy *Fishes*, produced after 403 BC (*Deipnosophistae*, 7. 329c). This play seems to have centred upon an imaginary treaty between Athens and the fishes, akin to the central conceit in Aristophanes' *Birds*: as with the birds of the latter, the play no doubt raised numerous issues of the identification, terminology, and qualities of a wide range of fish, a matter of keen interest to the author of the *Deipnosophistae*.

The oldest surviving manuscript of the *Deipnosophistae* is dated to the 10th century AD. The work seems to have been much used in the Middle Ages, at least in epitomized form: for his commentary on the Homeric poems, Eustathios draws from the epitome on some 2000 occasions. At present in Greece the term "Deipnosophist" has been resurrected in a series of articles on taste and aesthetics, which appeared in the newspaper *Kathemirini* intermittently from 1989 to 1991 and which have now been collected and published as a book, of which *Deipnosophist* constitutes both the title and its author's nom de plume. The inspiration of Athenaeus is explicitly acknowledged, but the modern work is not a dialogue and does not seek to reproduce the texture or flavour of its ancient forebear.

Biography

Born in Naucratis *c.*AD 150, Athenaeus was a leading figure in the movement known as the Second Sophistic. He spent some time in Rome as the guest of P. Livius Larensis. His principal work is an example of sympotic literature, the *Deipnosophistae*, which contains quotations from many other works that are now lost, notably comedy.

Athenagoras 1886–1972

Patriarch of Constantinople

Athenagoras was an important ecclesiastical figure of international standing during the 20th century. He was born on 25 March 1886 in the village of Tsaraplana (now Vasilikon) in Epirus and his lay name was Aristoklis (Spyrou). From 1903 to 1910 he studied theology at the school of Chalki, a traditional educational centre of the ecumenical patriarchate of Constantinople, and in March 1910 he was ordained a deacon. He then served in the diocese of Pelagonia (in the area of Monastir), where he undertook the supervision of Greek Orthodox schools and remained during the Balkan Wars and World War I. Following a short stay on Mount Athos in 1918, in March 1919 he was named secretary of the new archbishop of Athens, Meletios Metaxakis, who was very involved in ecumenical contacts. Athenagoras remained in Athens during that turbulent political period and was ordained priest in December 1922. In the same month he was elected bishop of Corfu and Paxoi, where he engaged in wide social, political, and ecclesiastical activities.

Athenagoras showed an early interest in the promotion of interreligious and particularly interdenominational dialogue, a fact that was manifested later in his strong ecumenical engagement. In 1930 he was named secretary of a conference, held at the monastery of Vatopedi on Mount Athos, to prepare for a prospective Panorthodox synod. In the same year he also participated in the Lambeth Conference in Britain to promote the continuation of Orthodox–Anglican dialogue. In August 1930 he was elected archbishop of North and South America by the Patriarchal Synod, a development that would have immense influence on his future ecumenical endeavours. Though not familiar with the conditions in the US, when confronted with the serious frictions in the ecclesiastical body and the Greek communities there, Athenagoras pursued a policy that proved to be very effective. During his 18-year stay in the US (1930–48), he managed, among other things, to bring about the internal unity of the Greek Orthodox Church in America, to provide the structure of the archdiocese with a set of administrative regulations that functioned well, to develop an effective charity system, and to secure its future on a solid basis through the organization of an Orthodox-oriented education system both for lay persons and for the priests of the archdiocese (e.g. the Holy Cross School of Theology in Brookline, Massachusetts). He also contributed to Greek War Relief, which aimed at alleviating the suffering of the Greek people in the wake of World War II. He initiated an approach between the various Orthodox national Churches (e.g. the Russian, the Serbian, and the Romanian) in an attempt to secure Orthodox unity and collaboration in the US. He also had the opportunity to develop further his international ecclesiastical and political contacts (e.g. with president Harry Truman).

Though an American citizen, Athenagoras was elected ecumenical patriarch of Constantinople on 1 November 1948. The Turkish state did not present any obstacles to such an election, but after his death in 1972 it changed its attitude on the matter. Serious criticism of his election came principally from the Soviet Union, which suspected the manipulation of Orthodoxy by the US to increase its influence in Eastern Europe. Such a reaction was fully understandable on the eve of the ensuing Cold War. During his long patriarchal reign Athenagoras transformed the Phanar from an isolated Orthodox centre, laden with spiritual resources and bygone glory, into a religious institution of international prestige and significance. He was also particularly interested in promoting the mutual rapprochement between Greeks and Turks. Such a policy was especially difficult considering the resurgence of nationalist confrontation between the two nations (e.g. the violent acts against the Greek community in Istanbul on 6–7 September 1955) and the Cyprus problem. This resulted in the evident suspicion with which the Turkish state viewed Athenagoras's ecumenical contacts and related activities.

Apart from his great interest in the dioceses of the patriarchate in Europe, America, and Oceania, Athenagoras placed particular emphasis upon inter-Christian reconciliation. In the official celebrations for the millennium of Mount Athos in 1963, he invited the prelates of other Christian confessions to participate alongside the Orthodox hierarchs. He also fostered the continuing dialogue with the Anglicans, the Old Catholics, and the Protestants, and made visits to Canterbury, Rome, and Geneva (to the World Council of Churches). Athenagoras's most important contribution to Christian unity was perhaps his initiation of the dialogue between the Orthodox and the Roman Catholic Churches. Between 1964 and 1967 Athenagoras and pope Paul VI had regular meetings in Jerusalem, Constantinople, and Rome. On 7 December 1965 the mutual anathemas, pronounced by the two Churches following the definitive schism between them in 1054, were withdrawn. This symbolic act of reconciliation and love, which was hailed as a decisive step in the future relations of the two Churches, was severely criticized by Orthodox hardliners and fundamentalists as well as by other Orthodox as a compromise, or worse, as a betrayal of the Orthodox faith due to the still existing theological differences between the two Churches.

Another important challenge that Athenagoras had to face was the disrupting and divisive effects of nationalism in the various Orthodox Churches, which had destroyed to a considerable degree traditional Orthodox unity. He therefore paid visits to the other three Orthodox patriarchates as well as to several other autocephalous Orthodox Churches. The preparation of a great Panorthodox synod to discuss various dogmatic, liturgical, and practical matters of common heritage and interest lay at the heart of his endeavours, as manifested in the Panorthodox conferences on the island of Rhodes in 1961, 1963, and 1964, and in Geneva in 1968. Moreover, the tension between Constantinople and Moscow was mitigated to a certain extent when patriarch Aleksii of Moscow visited the Phanar in 1961 and acknowledged the canonical rights of the patriarchate of Constantinople. Yet the pretensions of Moscow to be the great Orthodox Church were not in accord with the ecumenical vision of Athenagoras and his historic role as primus inter pares among all Orthodox patriarchs and archbishops. Although the results of these early Panorthodox conferences were unimpressive, certain positive steps have been taken in several directions, for example, concerning the non-Chalcedonian (Monophysite) and Nestorian Churches.

Athenagoras's death in 1972 signified a major turning point in Turkish policy vis-à-vis the ecumenical patriarchate. The

Turkish state intended to intervene more actively in the election procedures of the new patriarch, who from now on had to be a Turkish citizen too. The theological division of the school of Chalki was closed in August 1971, a development that seriously affected the patriarchate's capacity to provide its numerous Orthodox dioceses all over the world with the necessary ecclesiastical personnel. In addition, a clear intention of the Turkish state was to undermine the international and ecumenical role of the patriarchate by considering it solely as the religious head of the tiny Greek community in Istanbul. Such a policy, however, is in clear contrast to the heritage left by Athenagoras and his successful efforts in upgrading the patriarchate's international role in the contemporary world.

Athens

Capital of modern Greece

The modern city of Athens extends across the largest plain of Attica at a distance of 6–7 km from the coast to the south. Apart from this southern edge, which opens to the port of Piraeus and the Saronic Gulf, the city is surrounded by mountains, namely Aigaleo, Penteli, Parnitha, and Hymettos in a clockwise direction.

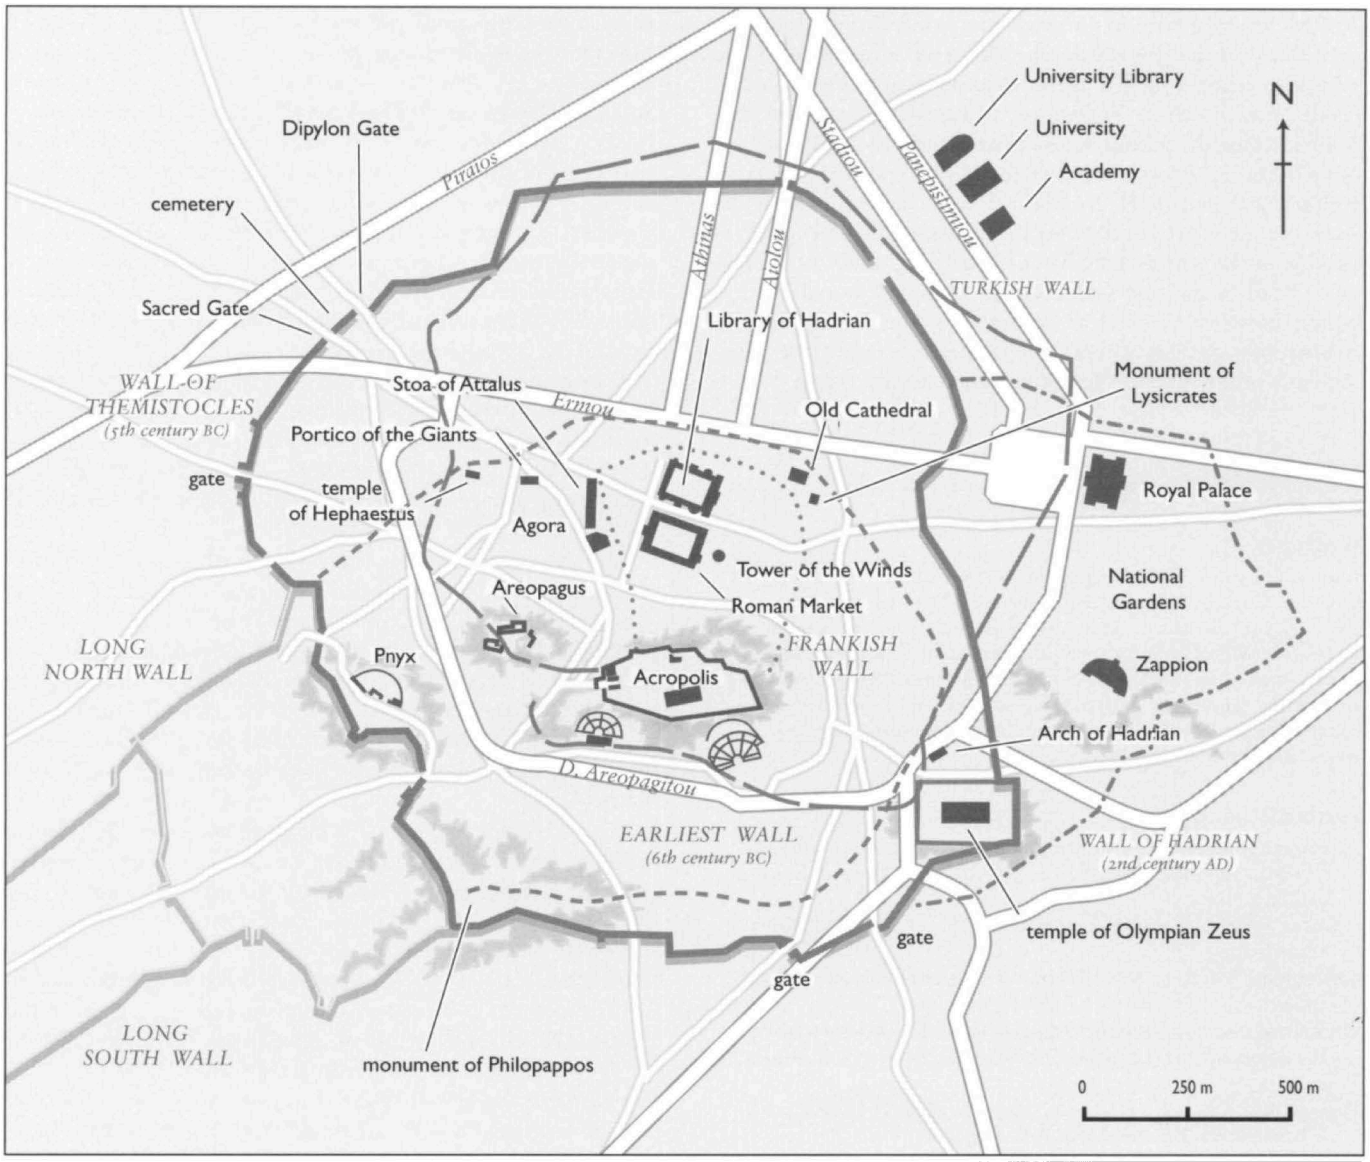
Archaeological evidence shows that the earliest settlement took place during the late Neolithic period around 4000 BC. The substantial remains of later periods have obscured these prehistoric settlements, but we know that the first nucleus of life in the region developed on the rock of the Acropolis and its cavities, with farms and roughly made huts subsequently spreading to the south. There is evidence of extensive farming, herding, and fishing and of the worship of a goddess of fertility. Subsequently a number of small and independent kingdoms were established around this nucleus, such as those in Kifisia, Brauron, Marathon, and Eleusis; trade links were developed, especially with the Cyclades; arteries to the Peloponnese and mainland Greece to the north were established; and fortifications were built, especially around coastal settlements, but also around the Acropolis in the second half of the 13th century BC. Athens continued to grow amid these independent conglomerations, and by the Late Bronze Age it was undoubtedly considered one of the most prestigious Mycenaean centres, as indicated by wealthy 14th-century BC tombs, the remains of a Mycenaean palace on the Acropolis, and the 13th-century BC fortifications.

It was sometime during the 14th or 13th century BC that all the kingdoms of Attica formed a political union called *Athinai* (in the plural) and centred around the ancient Athini or Kekropia. Even if not entirely peaceful, the unification – widely known as synoecism and assigned to the mythical hero Theseus who thus became the first king of the city state of Athens – was panegyrically celebrated in the Classical period with two major festivals, the Synoecia and the Panathenaea, which took place in the Agora.

The Mycenaean period is inextricably associated with a series of mythical kings, such as Cranaus, Erechtheus, Cecrops, Pandion, Ion, Aegeus, Codrus, and of course Theseus, whose lives nourished the Athenians' collective consciousness in historical times. But the city's prosperity was seriously affected during the collapse of Mycenaean civilization and the Dorian invasion at the end of the 2nd millennium BC. These tumultuous events brought about social changes that eventually led to the abolition of kingship. The Athenians took great pride in the fact that the Dorians never invaded the city, and it is from this period that the myth of autochthony stems. It was also at that time that Athenian refugees moved across to Ionia, in Asia Minor, in what would later be known as the first movement of colonization.

The descent of the Dorians (11th century BC) also marks the beginning of the Geometric period in Greek history, which lasted until the 8th century BC. Even though the period is often called the Dark Age of ancient Greece – mainly because of the general shortage of raw materials, the decline of trade, and the non-existence of writing – Athens steadily increased in size, new settlements were built, and its pottery with the famous geometric designs and the first sketchy outlines of the human body prepared the ground for subsequent artistic achievements.

In the course of the 7th century BC the increasing significance of craftsmanship and handicraft and the revival of trade put under scrutiny the unquestionable hegemony of the aristocracy of titles and land. There is evidence of a failed attempt of Cylon in 636 BC to exploit this general dissatisfaction in order to become a tyrant. Amid continuing struggle Draco codified the hitherto unwritten – mainly criminal – body of laws, but the unrest did not subside until Solon, a man trusted by all, reformed the state and the laws in 594 BC. His reforms



6. Athens

aimed mainly at including the lowest body of Athenians in political decisions, and they are often now considered as the first step towards the realization of democracy, even if they did not manage to elicit general consent.

Encouraged by their newly established political rights, the farmers and cattle breeders kept pressing for an improvement in their position and in 561 BC one of their most able politicians, Pisistratus, took advantage of their unrest and support to set up a tyranny. In spite of his hegemonic spirit, he gave out agrarian loans, boosted trade with other tyrannical states in the Aegean area, and opened the city up to Ionian philosophical and artistic influences. Ancient sources assign to him the first recording of the Homeric epics and the establishment in 566 BC of the Panathenaea, a first major instance of collective religious worship. The tyrannical regime became oppressive during the years of Hippias, who was finally chased away in 510 BC. After two years of renewed political struggle Cleisthenes from the aristocratic family of the Alcmaeonidae enlarged the list of Athenian citizens, divided the population into ten tribes of mixed origins, and inaugurated the policy of ostracism – enabling the citizens to demand the removal from the city for ten years of any citizen they deemed too influential. The newly established Athenian democracy provoked Persia by supporting the Ionian Revolt and subsequently successfully resisted the Persian assaults at Marathon (490 BC) and Salamis (480 BC).

A more integrated form of democracy is associated with the rule of Ephialtes (who was assassinated by reactionary aristocrats in 461 BC) and Pericles. But Athens' leading role in Greek politics had been formally acknowledged already from 478 BC with the foundation of the Delian League, which brought all subject allies under Athenian control. Led by able politicians and generals such as Aristides, Cimon, and Pericles himself, Athens prospered for 50 years in political, artistic, philosophical, and financial spheres alike; suffice it here to remind ourselves of the Parthenon, the golden-ivory statue of Athena in it, and Athenian tragedy – all products of that famous *pentekontaetia* (50 years) brought to an end in 431 BC by the

eruption of the Peloponnesian War, which was the result of Sparta's growing discontent in the face of an increasing Athenian expansionism in the late 430s BC. Lasting 27 years, the unprecedented cruelty of this conflict with Sparta exhausted the city and at the same time let Persia into Greek internal affairs in 407 BC, when the former stepped into the war on the side of Sparta.

The antagonism between the two principal Greek cities continued over the course of the 4th century BC and Persia was once again called upon during the Corinthian War (395–386 BC), this time on the side of Athens. During the short revival of its independent status in the first half of the 4th century BC, Athens pursued an alliance with rising Thebes and made a series of failed attempts, including a second Athenian League, to restore its imperial role. The cultural life was still flourishing but the political prestige and the finances of the city were in steep decline. The emergence of Philip II of Macedon around the middle of the century and his appeal for a Panhellenic alliance that would campaign against the Persians were met with Athenian distrust and hostility, as Demosthenes' well-known and flagrantly rhetorical speeches against the Macedonian king testify. Athens' military power received a heavy blow from the Macedonian army at Chaeronea in 338 BC, but its leaders in the 330s and 320s BC, notably Eubulus and Lycurgus, carried on with policies of retrenchment that stripped the city of its last opportunities for a viable political role in the new order.

Under Cassander of Macedon, Demetrius of Phaleron ruled peacefully but tyrannically so that the arrival of the Antigonid ruler, Demetrius Poliorcetes in 307 BC was enthusiastically welcomed. In spite of the financial adversities that kept on driving the citizens away (mostly to the Asian courts whose armies employed them as mercenaries), Athens in the Hellenistic period established itself as a centre of culture and philosophy of international status. Epicurean and Stoic schools were now added to the Platonic Academy and the Aristotelian Lyceum, while the theatre and the arts thrived. Roman domination in 146 BC had no effect on Athens' intellectual and cultural prestige, which was to last throughout the years of Roman rule as well as the early Byzantine era up to the 5th century AD. The city enjoyed a new economic boom around 100 BC, related to privileges bestowed upon it by the Romans. But the Athenians' support of Mithridates VI in an effort to regain their freedom was severely punished by Sulla in 86 BC.

From the 50s BC Roman nobles and emperors with philhellenic attitudes – notably Hadrian, Herodes Atticus, and Gaius Antiochus Philopappus – became benefactors of the city. During the 1st century AD the altar to the Unknown God and the first Jewish synagogue were erected. The Gothic descent on Europe had its impact on Athens, which was devastated by an invasion of Heruli in AD 267 and of Alaric in AD 396. The city's demographic and financial decline – which had already started by the end of the Peloponnesian War, when Athens is estimated to have had a population of around 36,000 people – was precipitated after the last destructions. At the same time, Christianity started making inroads. Already in the 3rd century AD celebrated Christian philosophers were teaching in new schools on the outskirts of the city.

Throughout the early Byzantine era Athens, together with all the dioceses of the Greek mainland, was placed under the administrative authority of the papal throne in Rome, maintaining at the same time a close relationship with Constantinople. However, in 732 emperor Leo III attached all the Greek dioceses to the patriarchate of Constantinople, as a retaliatory measure against the pope because of his opposition to Leo's own iconoclastic policy.

The attachment of Athens to Constantinople and the favourable presence of Irene the Athenian as consort to emperor Leo IV signified the start of a period of increasing prosperity for Athens. This was the period of the Slavic attacks against the Byzantine empire, which in the 19th century prompted Jakob Fallmerayer's claims about a Slavic prevalence in the Greek south before the 10th century. The current scholarly position maintains, however, that the influence of these Slavic nomadic groups was significantly limited in Attica – as, for example, the rarity of Slavic place names signifies – and that Athens, throughout these attacks, continued its increasingly prosperous existence, which was also reflected in the upgrading of the episcopate of Athens to a diocese in the 9th century, and the visit in 1018 of the Byzantine emperor Basil II Boulgaroktonos (Bulgar Slayer), following his victory over the Bulgarians of Samuel. The city also seems to have been little affected by the raids of Saracen pirates from Crete on the coasts of Attica in the beginning of the 10th century. The only significant disturbances to the prosperity of Athens were certain friction points with Thebes, the administrative centre of the Hellenic theme (i.e. the administrative division with political and military character that was formed during the 8th century AD in response to the Slavic pressure), in relation to tax collections and other decisions concerning Athens.

During the reign of the Komnenos dynasty – 10th–11th centuries – trade, agriculture, and craftsmanship continued to grow and a series of important monuments were built, the churches of Kapnikarea, Agioi Theodoroi, Agios Ioannis Karea, Omorphi Ekklisia, parts of the monastery of Kaisariani, and the monastery of Daphni with its famous mosaics on the west side of the city. However, education and intellectual life remained unresponsive to the cultural renaissance of Constantinople during the Komnenian dynasty. Michael Choniatis, the erudite last bishop of Athens before the Frankish occupation, draws in his writings a bleak picture of the intellectual achievements of the Athenians. This image should be associated especially with the second half of the 12th century, a time of steady decline for the city mainly due to regular pirate raids, the increasingly frequent encroachments of the Normans, and the arbitrary and heavy taxation rates imposed by the tax collectors of the Byzantine empire.

Athens was conquered by the Franks in 1205 and attached to the Frankish kingdom of Thessalonica. Even though under foreign rule, the city enjoyed a prolonged period of economic as well as political prosperity, which was additionally strengthened by its increasingly close relationship with the principality of Achaea. But desire for expansion towards the north brought in the Catalans as a mercenary army, who subsequently turned against the Franks and eventually conquered Athens in 1311. The Catalonian period was particularly painful for the Athenians, whose civil rights severely dwindled and who were reduced to a state of serfdom. Throughout the 14th century Venetian, Sicilian, and Spanish aspirations enfeebled the Catalans until they finally succumbed to the expansionism of

the Florentine ruler of Corinth, Nerio Azaggioli, who occupied the Acropolis in 1388.

The Florentines relieved some of the oppression infamously connected with the Catalans. Certain religious freedoms were restored for the Orthodox, and a few Greek representatives were admitted into the local administration. The period before the Turkish occupation in 1458 was one of prolonged turmoil, however, with Venetians, Turks, and Florentines clashing over the dominion of the city. The first half of the 15th century brought some renewed prosperity to Athens mainly due to the tolerant policy of Antonio Azaggioli towards the Greeks. But the economic, political, and social abuse of the westerners and the deep schism between the Orthodox and the Catholics, as underlined by the turbulent council of Ferrara-Florence (1438–39), aggravated the hostility between Latins and Greeks. As a result, when the sultan Mehmet II entered the city in 1458 its few remaining residents received him with feelings of relief.

Excited about this illustrious addition to his empire, Mehmet granted Athens special privileges, including the right to some form of local self-rule. This initial favouritism did not prevent religious oppression, however, which generated neomartyrs such as Philothei Venizelou, or aggression, such as the mass kidnapping of children; whereas the distrust of the local rulers also counteracted on an everyday basis the sultan's flexible attitude.

Driven by the hope that the Turko-Venetian war that had erupted in 1684 would prove useful in their own struggle for liberation, the Athenians entrusted the city to the Venetians on 10 September 1687. The battles that followed caused severe damage to the Parthenon and resulted in a very short-lived Venetian domination. When the Turks reoccupied the Acropolis, the Athenians fled the city en masse and did not start to return for three years, in 1691. The period of relatively liberal rule that followed, and lasted for most of the first half of the 18th century, came to an abrupt end with the friction between Turks and Russians towards the end of the century, when Turks again felt threatened by the Greeks' urge for liberation. Russians and Turks came to a – temporary – agreement in 1774, but the arbitrariness of the sultans and the local *voivode* was not eliminated. It was during the first years of the 19th century that Lord Elgin, having obtained the sultan's permission to collect already detached stones and inscriptions, managed to transfer the Parthenon and Erechtheum marbles to England.

The Revolution of 1821 spread great enthusiasm among the Athenians who became involved at once. Important military men came to the city's succour, among them Androutsos, Makriyannis, Karaiskakis, and later on the French Favière and Derigny. The Turks finally surrendered control of the Acropolis on 31 March 1833 and on 18 September 1834 Athens was declared the capital of the newly founded modern Greek state.

The transference of the capital from Nauplia to Athens transformed the small town of 1500 houses into the first political, economic, and intellectual centre of the new state. This transformation took time, however, and for most of the 19th century the robust, cosmopolitan periphery, with cities such as Ermoupolis and Patras, continued to attract the main financial activities of the new state, even though its political power was concentrated in Athens. From the very beginning, however, and within the narrow space of autonomous expression left to it by the conflicting interests of the supervising European Great Powers, the city struggled to establish a modern Greek identity for the new state. This effort was further undermined due to the mutual antipathies between the indigenous people and the newly arrived emigrants from Europe, as well as the military and the political leaders. Much energy was directed towards urban development, which combined two dominant styles, the more spontaneously romantic, with folk elements, and the Neoclassical. The latter was particularly boosted by the involvement of Classically educated German architects in designing the city and some of its most important public buildings, such as the palace (started 1832), the university (started 1839), and Hotel Grande Bretagne (started 1842). The subsequent years brought more freedom and a predominantly eclectic architectural style, even though the monolithic dependence on Classical antiquity as the prevalent tool for modern Greek self-expression meant that a fair number of Byzantine and later monuments were still being destroyed.

During the last decades of the 19th century Athens' political role continued to expand just as it was actively involved in the republican reformation of 1843, and the turbulent change of dynasty in 1863. Charilaos Trikoupis's premierships (in the 1880s and 1890s) brought further development, and vital work on the infrastructure that was largely missing in this architecturally impressive city was carried out. By the 1890s Athens had already begun to acquire a centrality not unrelated to the urban pull and overconcentration that plague it today. This centrality was boosted by the detachment between the 1880s and the 1920s of several other Greek regions from the ailing Ottoman empire and their attachment to the new state. People and resources from regions such as Thessaly, Epirus, Macedonia, Western Thrace, and Asia Minor, successively, were concentrated in Athens, thus enabling its industrialization at the expense of the periphery. The city has ever since been inextricably connected with all the most highly influential events of modern Greek political life, from the mutinies of royalists and Venizelists of the period 1909–35 through to the resulting dictatorship of Ioannis Metaxas on 4 August 1936 and the clashes of December 1944 between ELAS and British forces (also known as *Dekemvriana*) in the centre of Athens which, it is estimated, left about 800 buildings in ruins. Finally, in 1973, the protests of students at the Athens Law School and Polytechnic, which symbolized the discontent of the country as a whole with the military junta of the colonels, and heralded the fall of their regime a few months later.

From 1950 onwards there has been impressive economic and demographic expansion in the environs of Athens, attracting the greater part of the political, cultural, and administrative activities of the country. It is estimated that it has accommodated almost half of the national industry and produces almost half of the national income. Such a disproportionate growth has resulted in urban anarchy, pollution, and serious infrastructure failures that disfigure this otherwise dynamic city. The state has been aware of these problems and their impact on the socioeconomic development of Greece as a whole, and

has been trying to design policies that will redress this imbalance.

Summary

Inhabited since the Neolithic period (*c.*4000 BC), Athens was a major Mycenaean centre in the Late Bronze Age. A tyranny was set up Pisistratus in 561 BC, to be followed at the end of the 6th century by the democratic reforms of Cleisthenes. After the Persian Wars Athens emerged as leader of Greece and centre of Hellenic culture. Political hegemony was dissipated by the Peloponnesian War and subsequent struggles with Macedon and Rome; cultural supremacy was retained undimmed until the 5th century AD. Athens was named the capital of the modern Greek state in 1834 and has ever since been the prime focus of political and cultural activity in the country.

Athos, Mount

Principal centre of Orthodox monasticism

Mount Athos is a peninsula in northern Greece, the most easterly of the three claws that Chalcidice extends into the Aegean Sea. From the isthmus in the northwest to the southeast point the distance is about 56 km, while that from coast to coast is rarely more than 8 km. About 6 km south of the isthmus a wall marks the frontier, and beyond it the ground rises steeply to wooded peaks of 500 and 600 m. South of Karyes, the capital, which stands more or less in the centre of the peninsula, the woods turn to scrub and eventually to bare rock as the contours rise, peaking finally at 2030 m before a sudden drop down to the sea. For more than a thousand years Athos has been the exclusive preserve of Orthodox monks; to this day it remains the principal centre of monasticism for all the Eastern Orthodox Churches. It is dedicated to the glorification of the Virgin Mary (or Theotokos), whose garden by tradition it is. She alone is held to represent her sex there, which is why Athos is closed to women.

In antiquity Athos was already a holy mountain, its peak being sacred to Zeus. In 492 BC the Persian fleet of Mardonius was dashed to pieces on the rocks at the southern point; mindful of this, the next time the Persians invaded Macedonia by sea, in 480 BC, they cut a canal through the isthmus to ensure the safe passage of their ships. Several cities were founded on the peninsula, and in the 4th century BC there was even a bizarre proposal to carve the mountain itself into the image of Alexander the Great; but the king told his architect to concentrate rather on designing the new city of Alexandria, and by the early centuries AD it seems that the place was deserted.

No one knows when the first monks arrived on Athos, but it is unlikely to have been before the 8th century. (Some monasteries claim foundation dates as early as the 3rd or 4th century, but there is no evidence to support them.) The first recorded reference to Athonite monks is at the synod, known as the "Triumph of Orthodoxy", convened by the empress Theodora in 843 to celebrate the end of iconoclasm; and some 9th-century hermits are known by name: Peter the Athonite, who lived in a cave *c.*840–90, and Evthymios of Thessalonica, who founded the first community of ascetics. The first real monastery was established in 963 by St Athanasios of Athos with the support and encouragement of the emperor Nikephoros II Phokas. Still known as the Great Lavra (or Megiste Lavra), it holds first place in the hierarchy of all the monasteries, and the Athonite millennium was duly celebrated there in 1963. The ascetics opposed the introduction of cenobitic (common life) monasticism and, after the murder of Nikephoros in 969, appealed to the new emperor, John I Tzimiskes; but he overruled their objections, and ever since then both traditions – the eremitic and the cenobitic – have coexisted on Athos.

Further monasteries were soon founded, though not all survive today. Of the twenty that do, nine were established in the 10th century, four more in the 11th, one in the 12th, one in the 13th, four in the 14th, and the last in the 16th. These figures reflect the fortunes of the empire at the time. In earlier centuries there were many monastic centres and many holy

mountains elsewhere; but after the Turkish conquest of Asia Minor, the Latin occupation of many Byzantine provinces in Europe, and the Slav advances in the Balkans, by the 14th century Athos was the only one to survive. Since then it has always been known as *the* Holy Mountain (*Agion Oros* in Greek).

Athos has always been an international centre, a focus for monasticism and pilgrimage for all the Orthodox Churches. The Bulgarian monastery (Zographou) was founded in the 10th century, as was the Georgian house of Iviron (now Greek); Russians have had a monastery since the 11th century, Serbs since the 12th; Moldavians and Wallachians have long been represented, and there was even a Benedictine monastery for Amalfitans from the 10th century to the 14th. Today seventeen of the twenty monasteries are Greek-speaking; there is one each for Serbs, Bulgarians, and Russians; and two sketes (monastic villages) are reserved for Romanians. All sketes, cells, and hermitages are subordinated to the larger foundations, which is why the latter are called "ruling monasteries". Each of them is a self-governing, independent entity within the monastic federation, and between them they rule the Mountain. Each sends an elected representative to serve for a year in the Holy Community, the parliament of Athos, which meets regularly in Karyes. These arrangements have been in place since an imperial decree of 1046, on the strength of which the monks claim that theirs is the oldest continuing democracy in the world. From the start the Mountain came under the jurisdiction of the emperor, but by the early 13th century the new monasteries had become stavropegic (under the authority of the patriarchate) and in 1312 authority over the whole Mountain was transferred to the patriarch by emperor Andronikos II Palaiologos.

Athos survived the turmoil of the empire's last centuries, but not without a fight. All the monasteries suffered constant assaults by pirates, crusaders, adventurers, and Turks who would stop at nothing to strip them of their treasures. The need for self defence made them look more like castles and fortified towns, which is in many ways what they became. In order to attract wealthy and influential recruits, many monasteries began to depart from the cenobitic system (according to which all wealth is contributed to a common purse) in favour of a more individualistic (or idiorrhythmic) way of life in which personal wealth and profit were accepted. Though frowned upon at first, this alternative system did eventually gain imperial sanction in 1406 and was until recently followed by at least half of the monasteries.

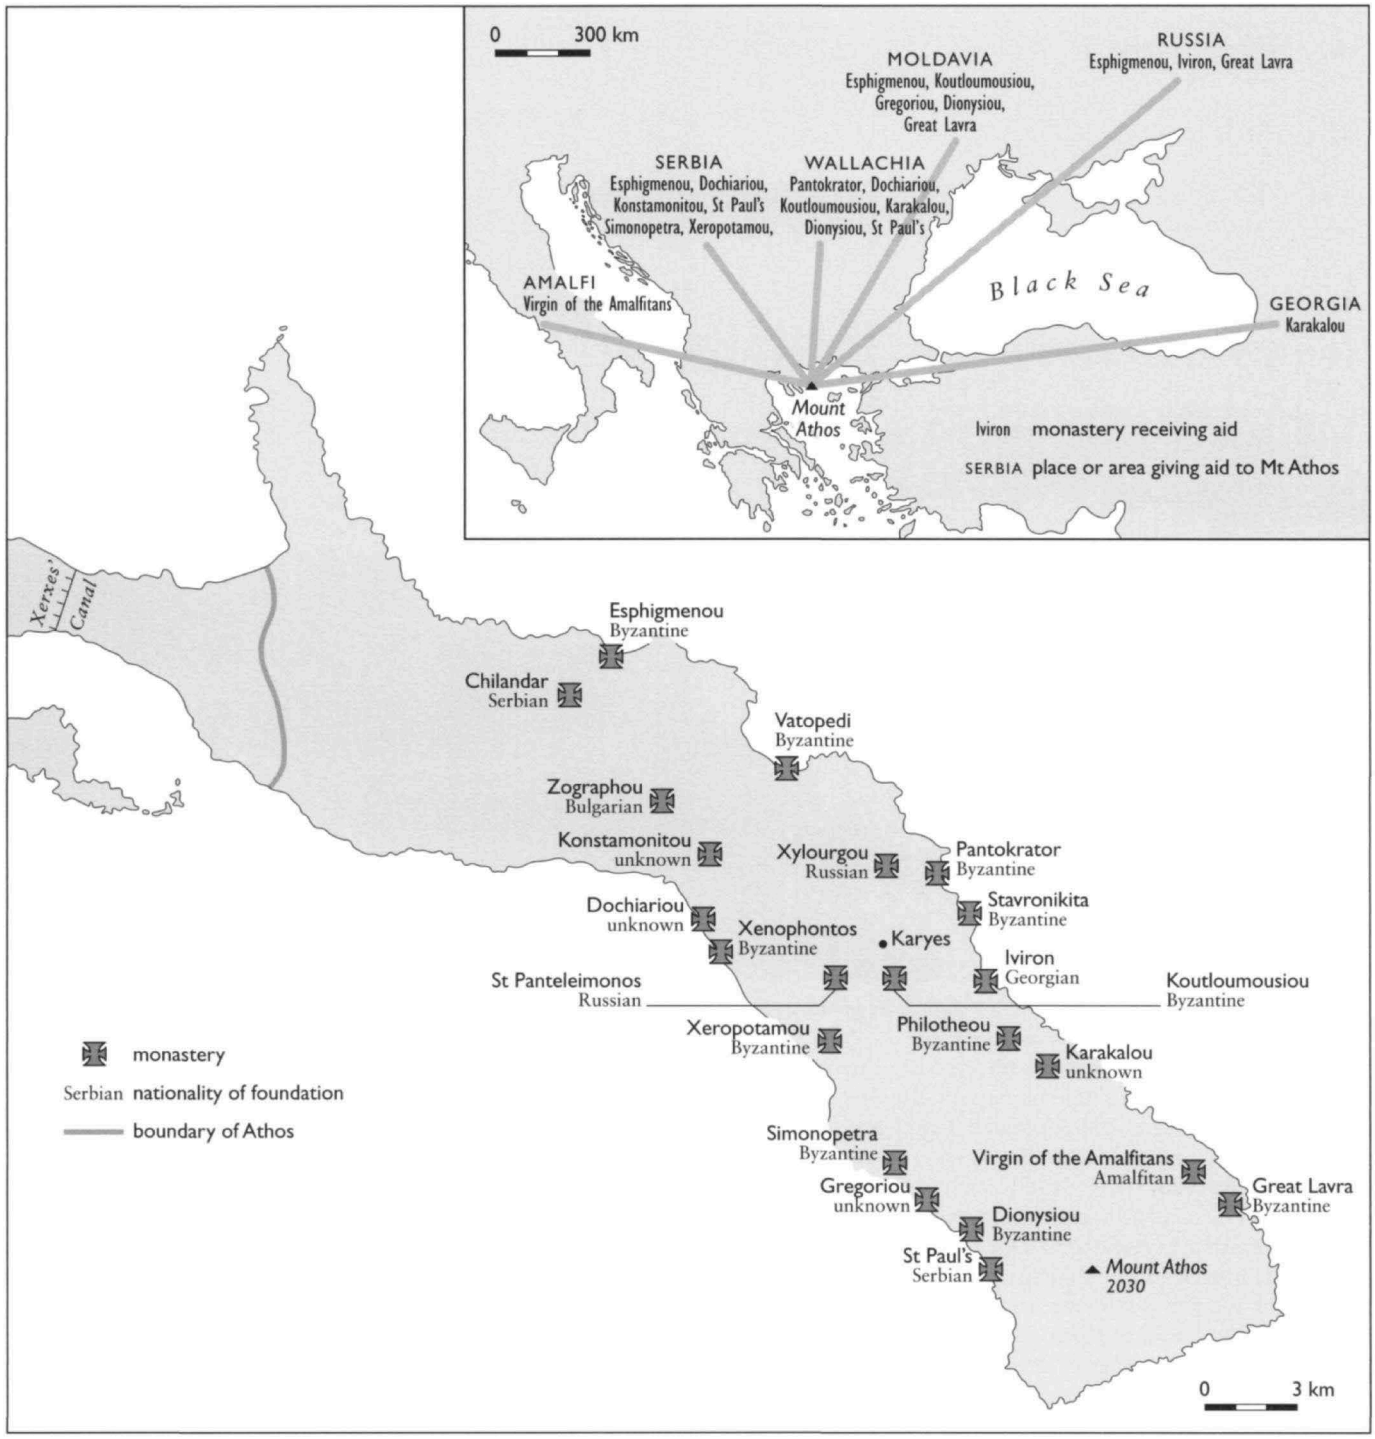
As the chief monastic survivor, Athos was able to take full advantage of the so-called Palaiologan renaissance, the cultural flowering that Byzantium enjoyed while the empire crumbled. Artists such as Manuel Panselinos were employed to decorate the principal churches. Musicians such as St John Koukouzeles, a monk of the Great Lavra, revolutionized the tradition of Byzantine chant. Theologians such as St Gregory Palamas, whose doctrine of hesychasm forms the basis of Athonite spirituality to this day, made Athos an international centre of scholarship. Emperors, anxious to gain the sympathy of the monks, or of the people, or of God, endowed the monasteries with treasures; and some were even tonsured monks themselves. In the late Byzantine period the monasteries were major landowners, and their surviving records are among the most important documentary evidence for Byzantine economic life.

Although the confiscation of monastic estates had begun even before the end of the empire, Athos was still in a strong position when Ottoman occupation began in 1430. The monks lost their remaining estates in Macedonia and Thrace, and they were forced to pay tax to the sultan; but they retained their autonomy, they remained under the spiritual protection of the ecumenical patriarch, and they continued to enjoy a period of prosperity. During the 16th century another monastery (Stavronikita) was founded, library holdings continued to expand, and the Cretan school of painters was active on Athos, creating some of the most glorious examples of their art. While the rural population fell into a state of increasingly profound ignorance, poverty, and despondency, the monasteries, and especially those of the Holy Mountain, upheld the traditions not only of Orthodoxy but also of Byzantium. Indeed it is no exaggeration to say that during the long, dark centuries of the Tourkokratia Athos was one of the principal guardians of Hellenism.

Even in the 17th century, when standards of education and literacy in Greece and Asia Minor had reached a very low ebb, the monasteries continued to acquire books for their libraries. But in the 18th century there was a decline, which the patriarch Cyril V made a determined effort to resist with the foundation in 1753 of an academy near the monastery of Vatopedi. His intention was to restore Athos to its place as a centre of religious culture and learning and to that end he appointed the philosopher Evgenios Voulgaris as director of the school. But the experiment failed: Voulgaris's theories proved too liberal for the monks, within a few years he was removed to Constantinople, and the school was destroyed by fire.

In the late 18th century, while the secularizing spirit of the Enlightenment began to take hold of Western Europe, a conservative reaction to it sprang up on Athos. The members of this movement, known as the Kollyvades, sought to show that Greek national awareness would be regenerated not by adherence to Western notions of secular liberalism but by a return to the spiritual values of true Orthodoxy and patristic theology. Among the leading figures of this "fundamentalist" revival were St Makarios of Corinth (1731–1805) and St Nikodemos of the Holy Mountain (1748–1809), who collaborated to produce an extensive anthology of Athonite spiritual writing known as the *Philokalia* (Venice, 1782), a work that retains its popularity and influence to this day. Salvation through Orthodoxy was also the message of another Athonite monk of the 18th century, St Kosmas the Aetolian (1714–79). He made a number of missionary journeys through the Greek-speaking lands in an attempt to revive the flagging morale of the people, emphasizing the link between Orthodoxy and the Greek language, and founding Greek schools wherever he went. Eventually falling foul of the Ottoman authorities, he was executed and joined the ranks of the so-called Neomartyrs who died for their faith during the Tourkokratia.

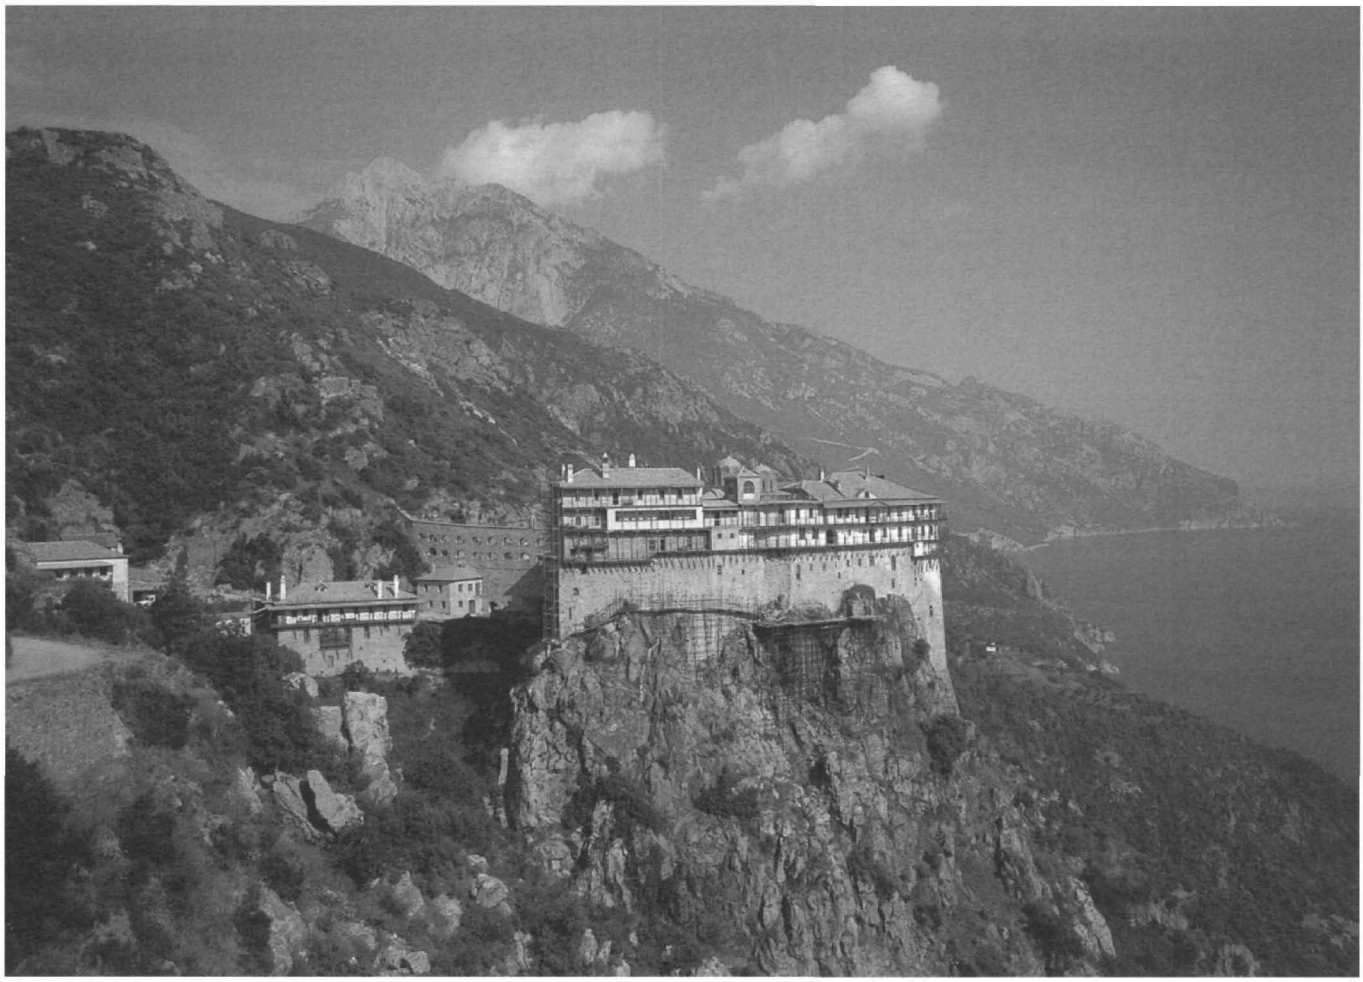
Throughout much of the 19th and 20th centuries Athos felt the impact of political events in the outside world. The preference of most elders was to hold aloof from involvement in the War of Independence (1821–32), but many younger monks could not resist showing their sympathy for those fighting for freedom. The Turks quickly snuffed out the revolt and installed



7. Monasteries of Mount Athos

a garrison of 3000 troops on the Mountain. As a result many more monks fled and the population fell to barely a thousand.

After the establishment of an independent Greece in 1832 the fortunes of Mount Athos began to recover, only to be threatened again from another direction. During the latter part of the 19th century the number of Russian monks at the monastery of St Panteleimonos began to increase dramatically. The buildings there and at the Russian sketes were enlarged out of all proportion to accommodate the influx, and there were soon more Slavs than Greeks on the Mountain (5500 out of a total population of 9800 in 1910). The motive for this was perhaps more political than religious, though that is not to say that there were not many pious ascetics among them. Some say that the tsar had set his sights on the throne of Constantinople and saw Athos as a convenient strongpoint from which to dominate the Aegean. But, whatever the motive for it, the attempted Russian takeover failed – for two reasons. First, the Great Powers intervened and refused to ratify the treaty of San Stefano (1878) which would have ceded most of what is now northern Greece to a greater Bulgaria under Russian patron-



Athos: the monastery of Simonopetra dating from the 14th century with the peak of Athos itself behind

age. Second, despite their numbers, the Russians never controlled more than a single monastery; and on Athos what counts is not monks on misericords but ruling monasteries in the Holy Community. Even so, the Russians remained numerically dominant until the Revolution of 1917, after which borders were sealed and there was a rapid decline. Numbers at St Panteleimonos have been falling ever since.

The other event that had a significant impact on the Holy Mountain was the dismemberment of the Ottoman empire. Along with the rest of northern Greece, Athos was liberated in 1912; but it took another 11 years of almost continuous war before any sort of stability returned. Even then, the price paid by the monasteries was the confiscation of their estates in Chalcidice to make way for some of the hundreds of thousands of refugees "returning" to Greece from Asia Minor in 1923 in the compulsory exchange of population. Suddenly, after nearly 500 years of Turkish rule, Athos was stripped of a large part of its raison d'être – as the guardian of Hellenism. Like Cavafy's barbarians, the Turks were "a kind of solution". Even though the Great Idea was in ruins and Greece was overrun by impoverished, starving, and unemployed refugees, the Greeks were a free people with their own land, their own language, their own culture, and their own religion. Finally released from its political-cultural responsibility, the Mountain needed to find a new role to play. It faltered – for half a century – and by the 1960s, when Athos was celebrating a past of 1000 years, it seemed to many observers to have no future at all, except as a museum of Byzantine art and architecture, and the Greek government was keen to realize its potential as a centre for tourism.

But the spiritual traditions of Athos, which had not died at all, are extremely resilient. While the monasteries, especially the idiorrhythmic ones, became so depleted in numbers that some were even threatened with closure, there was increased activity in the sketes and cells at the remote tip of the peninsula, the so-called desert of Athos. This area had always attracted hermits and ascetics who shunned the monasteries and withdrew entirely from the world. During the 1950s and 1960s a number of such men gained reputations as gifted teachers and acquired groups of disciples, mostly educated young men eager to follow their example. Several monasteries on the brink of collapse turned to these men and invited them in, at the same time accepting the need to revert from the idiorrhythmic to the cenobitic way of life. At first this meant no more than a reshuffling of the existing population; but from the 1970s there was a steady increase in numbers over all, and by the mid-1990s the total was approaching 2000 from a low in 1971 of 1145.

All 20 monasteries now follow the cenobitic rule; standards of spirituality have risen markedly with the influx of better-educated monks; buildings that had fallen into disrepair are

being restored; treasures are being properly cared for; libraries are being catalogued and manuscripts conserved; skills such as icon painting, wood carving, and chanting are being revived on traditional lines; there is clear evidence of renewal in nearly every monastery (the exceptions to this are the non-Greek houses). The revival is an entirely traditional one: in no sense is it a reform; even the abolition of the idiorrhythmic system signals a return to the original cenobitic way of life. The downside is that, as monks tend increasingly to come from an urban, educated background instead of a rural, peasant one, some skills such as farming and fishing have to be relearnt; and in order to fund the revival, some monasteries have been tempted to overexploit their forests, resulting in the replacement of mules and mule-tracks by motor vehicles and a network of roads. Furthermore, the determination of the majority of the monasteries to assert their autonomy and their panorthodox traditions has on occasion resulted in friction with both the patriarchate in Constantinople and the government in Athens which are charged respectively with spiritual and civil authority over the Mountain. But the fact is that at last Athos has rediscovered its raison d'être, which is to provide a radical alternative to the ever-increasing secularization of modern society. As a result it has resumed its traditional role and is once again operating as the spiritual heart and voice of Orthodoxy.

Summary

Principal centre of monasticism for all the Eastern Orthodox Churches. First monastery founded in 963. Expanded rapidly in the 10th and 11th centuries. Flourished in the late Byzantine period as a centre of scholarship and art. Operated as the guardian of Hellenism throughout the Tourkokratia. Declined spiritually in the 19th century and numerically in the 20th. Enjoying revival since the 1970s. Closed to women.

Atomism

One of the greatest contributions of ancient Greek philosophical *logos* to world civilization was the expression of a series of theories on the beginnings and structure of matter. Some were simple; others were more complex. Regardless of whether or not they were correct, they were a significant source of ideas and rationales that eventually played a role in the formation of modern scientific thought, even if they were incomprehensible to some.

The so-called atomic theory played a leading role. It consisted of a characteristic central idea that rejected the notion of an infinite divisibility of matter, as opposed to Aristotelian philosophy. The founder of the ancient theory of atomism is supposed to have been Mochus or Moschus, before the Trojan War. Leucippus, Democritus, and Epicurus, though not the introducers, described it and proved reasonably that atoms are the first principles of bodies. The views of Epicurus are considered by many to be the foundations on which many later Europeans formulated their own theories. As for Leucippus, whose historical existence has on occasion been disputed, we know that he was active in Miletus around the middle of the 5th century BC. According to Aristotle and Theophrastus, the title of his work was the *Great World System* (*Megas Diakosmos*). One of his students was Democritus, who was born in Abdera around 460 BC. All the original writings of Democritus are lost but excerpts of his work survive in later writers. Epicurus continued after Democritus.

The basis for adopting the existence of atoms is the acceptance of the existence of a vacuum, which is another distinction from Aristotelian philosophy. The existence of a vacuum, however, contradicts the theory of an infinite divisibility of matter. For this contradiction to be resolved, Leucippus' atom must be free of any vacuum and remain unchanged; a vacuum

can exist only in the space between the atoms. Atoms are not born; they are indestructible, unchangeable, simple, and therefore eternal and with specific dimensions. They are not motionless but are in a state of a perpetual spin, which allows similar atoms to come closer together. According to Democritus, bodies are initially formed by the joining and binding of groups of atoms that eventually mould a world or worlds, since atomistic philosophers support the existence of infinite worlds. The perfect atoms move towards the peripheral and form a spherical celestial dome; heavier materials move towards the centre of the sphere and constitute the earth. Based on the atomic theory, Democritus tried to give a convincing interpretation of the subject of colours, maintaining that the four primary colours – white, black, red, and yellow – were the result of the different types and positions of the atoms inside the body.

From the ancient Greek theory of atomism, Newton mainly adopted that of hardness when he expanded his atomic theory in the *Opticks* (Query 23). Many, however, consider that the scientist who brought the atomic theory into the public eye was Pierre Gassendi, who in 1649 published his comments on the 10th book of Diogenes Laertius and the *Syntagma Philosophiae Epicuri*, both of which contained a presentation of Epicurean and Democritean atomization.

This general theory by Western Europeans concerning the atomic structure of bodies was also basically accepted by Greek scholars during the Tourkokratia. Everybody now accepts that atoms are the basic factors of matter. Nikiphoros Theotokis, in the first chapter of his book, *Elements of Physics* (*Stichia Physikis*, 1766–67), wrote characteristically:

> Lucretius, Gassendi, Boerhaave, Desaguliers, and the other modern philosophers suppose atoms to be the principles of every body. These atoms are quite small, hard, moveable, pathetic, impenetrable, impassable. As they are elements of every body, and the basis of bigger bodies, we need to find their properties.

Scholars also accepted Dalton's later theory on atoms formulated in 1805. Dalton's atom was, of course, quite different from the modern atom, but it constituted one more link in the chain of the evolution of scientific thought from antiquity up to today.

Attalids

Ruling dynasty of the Hellenistic kingdom of Pergamum

The Attalids were the ruling family of the kingdom of Pergamum, which flourished under their control in the Hellenistic period from 281 to 133 BC. The dynasty was established by Philetaerus, a general in the army of Lysimachus, one of the successors of Alexander the Great. Lysimachus had gained control of Thrace and northwestern Asia Minor in the struggles after Alexander's death (323 BC), and he kept a large part of his state treasury in the city of Pergamum, which was under Philetaerus' command. In 281 BC Lysimachus was killed in battle, and Philetaerus laid claim both to Pergamum and to the treasury of 9000 talents. The 18 years of Philetaerus' rule (281–263 BC) were dedicated primarily to establishing and extending his control of northwestern Asia Minor and solidifying his family's position as the rulers of Pergamum.

In the early 3rd century BC Pergamum was a small Greek city built on top of a high acropolis whose walls enclosed houses, military barracks, storerooms, water cisterns, an agora (marketplace), and a small temple built of andesite (the locally available stone) honouring Athena (patron deity of the city); near the lower reaches of the citadel, outside the walls, was a temple of Demeter. Food was supplied by farms in the surrounding plain of the fertile Caicus river valley. With his financial wealth, an easily defended acropolis, a fertile farming region, and reliable water sources, Philetaerus' main problem was protecting the outlying parts of Pergamum from the city's enemies. The most insistent of these were the marauding Gauls, a warlike tribe from central Europe that had crossed into Asia Minor in 278 BC and was harassing the cities and towns of northern and western Anatolia. While Philetaerus waged several successful battles against the Gauls between 278 and 276 BC, he often dealt with their threats of attack and plunder in the same manner as other local political leaders – by paying hefty tribute.

Philetaerus, who had no children of his own, adopted his nephew Eumenes, and named him his successor. Eumenes I (263–241 BC) was occupied in much the same manner as his uncle: he defended Pergamum against the more powerful Hellenistic kings, especially the Seleucids, extended the territory under his control, and continued the policy of pacifying the Gauls through payment of onerous tribute. Eumenes I was followed by his cousin Attalus I, who ruled from 241 to 197 BC. Attalus was an astute politician, a brilliant general, and a patron of education and the arts. It was during his reign that Pergamum began its transition from a hilltop fortress to a splendid Hellenistic metropolis. His first major act was to refuse to pay tribute to the ever-menacing Gauls. He led the Pergamene army against them, defeating them solidly. In honour of his achievement, the epithet "Soter" (Saviour) was

added to his name, and he was the first of his family to be given the title "king". The victory over the Gauls was followed by a number of military successes, often in alliance with an increasingly powerful Rome, and Pergamum's control and influence in Asia Minor were extended and strengthened.

Two of his sons followed Attalus I as king – Eumenes II (197–159 BC) and Attalus II (159–138 BC). Their reigns brought Pergamum to its zenith as a prominent political and cultural centre in the Hellenistic world. The city's population increased to more than 100,000 people, while the kingdom as a whole covered 172,880 sq km with a population of 5,500,000 comprising five classes of residents: citizens, foreign residents, soldiers, freedmen, and slaves. From the beginning, Pergamum had been governed by the constitution of a Greek city state, although the monarchy had exercised great authority in the political system. During the reign of Eumenes II the military alliance with Rome, which had contributed much to the growing strength of Pergamum, was temporarily broken and Eumenes led his army unassisted in an important battle against the Gauls, who were waging frequent attacks on many of the cities in Asia Minor. This victory, won without the help of his powerful ally, substantially enhanced Eumenes' standing among neighbouring political leaders and greatly increased the power of the Pergamene monarchy.

Attalus II was an elderly man when he ascended the throne upon the death of Eumenes II. During his 21-year reign (159–138 BC) he continued the policies of his brother. He was a competent military leader and diplomat, continued the alliance with Rome, and was a patron of scholars and artists. Attalus II was succeeded by Attalus III, a son of Eumenes II, who ruled for only five years (138–133 BC). Upon his death this last Attalid king bequeathed Pergamum to Rome in his will. This act has never been clearly understood, but his decision may have been based on the knowledge that there was little chance that Pergamum could remain independent much longer. Rome had conquered mainland Greece, and devastated those who stood against it. Because of Attalus III, the citizens of Pergamum were neither plundered nor enslaved, but continued their lives in peace under the new regime. Pergamum became the capital of the Roman province of Asia in 129 BC.

The Attalids, especially from the time of Attalus I, saw themselves as the preservers of Classical civilization in the Hellenistic period. Since the political and military endeavours of Alexander the Great and his successors in the 4th century BC had moved the focus of the Greek world to Asia Minor and the Near East, resulting in the diminishment of mainland Greece, the goal of the dynasty was to make Pergamum the cultural and artistic successor of Athens. Along with the wealth of the original treasury of Lysimachus, the Attalids had a number of sources of income with which to implement their plan. Taxes were paid by the indigenous communities in the surrounding territory; tribute was paid by subject cities; and duties were assessed on items that were transported through territory under Attalid control. Pergamum also had great natural resources. Farms in the Caicus river valley produced wheat, barley, grapes, figs, olives, pomegranates, horses, pigs, cattle, and sheep. Mines and quarries supplied gold, zinc, copper, andesite, and marble. Pergamene factories produced wool, carpets, woven textiles, sewn garments, leather, perfumes, pottery, armour, and parchment. The great wealth of the kingdom by the 2nd century BC allowed Eumenes II to institute a major building programme that turned Pergamum into a magnificent city of marble monuments that was more than four times its original size.

Along with city planners and architects, Eumenes II welcomed artists and scholars. Pergamum had been known for its school of sculpture since the reign of Attalus I in the 3rd century BC when several famous sculptors came to the city to create a multifigured group to commemorate the king's victory over the Gauls. The epitome of the Pergamene school, and of all Hellenistic sculpture, however, was the reliefs of the spectacular Pergamum Altar (now in the Berlin Staatliche Museen), a monument that honoured the Attalid dynasty, their military victories, and Pergamum's founding hero, Telephus. Dynastic support of a wide range of scholars, especially those connected to the schools of philosophy in Athens, had begun during the reigns of Eumenes I and Attalus I. Attalus' own teacher had been a Peripatetic philosopher from Athens, and his son Attalus II studied at the Academy in Athens. While Pergamum did not develop a professional school comparable to that at Alexandria, the scholarly environment created by the kings attracted a large number of well-respected philosophers, mathematicians, historians, biographers, geographers, astronomers, poets, playwrights, engineers, physicians, and scientists. The Attalids' support was not restricted to the professional class, however, but extended as well to a sophisticated secondary education system in which both boys and girls from Pergamum received instruction.

The scholarly climate was enhanced even further by the creation of the renowned Pergamene library during the reign of Eumenes II in the 2nd century BC. Second only to the library at Alexandria in antiquity, at its height it may have owned as many as 200,000 works. The most significant scholar in Pergamum in that period was Crates of Mallus, a Stoic philosopher, literary critic, grammarian, and geographer, who was also probably director of the library. He created a system of cosmogony in which the earth was round, and while he was not the first person to describe the earth as a sphere, he was the first to construct a three-dimensional geographical globe. Crates seems to have been influential in encouraging the production and export of fine-quality parchment, for which Pergamum became justly famous. The use of parchment not only eventually displaced papyrus as the main writing material in antiquity, but it facilitated the development of the paged book (codex), which had replaced rolled documents by the 4th century AD.

As the power of the Roman empire waned in the 3rd century AD, Pergamum declined in population and contracted in size. The city diminished in standing as a centre of political, commercial, and military activity. Except for the renovation of the temple of the Egyptian gods as a Christian basilica, it also played only a small role in ecclesiastical affairs. The sanctuary of Asclepius was abandoned, as were most other buildings in the plain and on the lower levels of the acropolis. By the late 3rd century AD the city consisted primarily of houses built over earlier structures on the fortified upper acropolis. Pergamum did continue the Attalid tradition of being a centre of intellectual activity, however, playing a prominent role in the scholarship of the 4th century. It was home to the school of Aedesius (d. 355), a Neoplatonist who trained most of the famous teach-

ers of philosophy in western Anatolia, including Maximus of Ephesus (d. 371), one of whose pupils was the future emperor Julian. Oribasius (d. 400), a companion of Julian and a native of Pergamum, was one of the most famous doctors and medical writers of the period; he was especially noted for his compilation of excerpts from the works of earlier Greek and Roman physicians.

While Pergamum continued to be occupied during the Byzantine period, it is little more than a shadow on the page of history. It was captured for brief periods by the Arabs in the 7th and 8th centuries, and refortified by the Byzantine emperors Constans II and Manuel Komnenos in the 7th and 12th centuries, respectively. It came under the authority of the Greek emperor of Nicaea, Theodore Laskaris, in 1214, then Turkish emirs gained control in 1302. By the end of the 14th century Pergamum had been nearly destroyed by invasion and sacking. In the Byzantine period ancient Greek manuscripts and knowledge of Classical culture were preserved in major centres of learning, such as Constantinople, Thessalonica, and southern Italy. How much influence came down to them from the scholarly environment created by the Attalids at Pergamum – through the disbursement of the library's holdings or through the students trained by teachers from Pergamum – remains unclear from the current state of knowledge.

Summary

The Attalids were the founders and ruling dynasty of the kingdom of Pergamum in Asia Minor between 281 and 133 BC. They saw themselves as the preservers of Classical civilization and their goal was to make their capital city the successor to Athens as the cultural and artistic centre of the Hellenistic world. To this end they compiled a library of some 200,000 works and supported a large number of scholars in all areas of Greek learning, as well as artists, city planners, and architects, who turned Pergamum into a metropolis of marble monuments.

Attica

Region of central Greece

Ancient Attica was made up the greater part of the modern nome of the same name. A three-sided peninsula which protrudes from central Greece, Attica is surrounded by sea on two sides with Cape Sunium and its famous temple of Poseidon at the southernmost tip. On the landward side Boeotia and Megara lie on the borders. In antiquity Attica covered over 2400 sq km and embraced a variety of mountain ranges and valleys as well as coastal and inland plains. The extent of the territory increased in specific periods, as the disputed areas fought over by Athens and Boeotia or Athens and Megara were added to Attica.

The Parnes mountain range separates Attica from its main northern rival, Boeotia. Here the competing poleis (or city states) fought over the upland plains and near the coast the important centre of Oropus. At the heart of Attica lies the Cephisus plain with the city of Athens at its centre. Enclosing the city and its plain are the mountain ranges of Hymettus on the east and Aegaleus on the west. Beyond Aegaleus stretches the Thriasian plain and the border with Megara. Eleusis lies at the southern edge of this plain. It looks across to the island of Salamis which was part of the Athenian polis in antiquity. To the northeast of Athens lie the Penteli mountains. Both Hymettus and Penteli provided the city with marble for building projects, most famously those on the Athenian Acropolis of the 5th century BC funded by the maritime empire. In southern Attica, the other major upland area, the Laurium hills were famous for silver and lead ores. The silver financed the construction of Athenian ships in the first quarter of the 5th century and continued to provide Athens with a large reserve of wealth on which it built its success. The natural resources of Attica, precious metal and marble, supplemented its agricultural assets, in particular olive oil, honey, and figs. These were the three most important cultivated crops of the region in antiquity.

Attica has been occupied since neolithic times. Evidence for human activity on the Acropolis dates back to about 3000 BC: pits and wells containing late neolithic pottery have been found near the Clepsydra spring on the north slopes. Wells and burials of the Early and Middle Helladic periods (3000–1500 BC) show signs of continued and expanding human settlement in Attica into the Late Bronze Age. In the Mycenaean period (Late Helladic: 1550–1100) the growth in the number and quality of sites and the associated finds in Attica is remarkable. The end of the Mycenaean period sees a drop in the number of sites and quality of burial goods in Attica during the second half of 12th century BC. The Dark Age period, which covers the sub-Mycenaean to the end of the Protogeometric periods (1100 – *c.*900 BC), is fast becoming a misnomer in the history of Attica. Iron technology spread quickly in this period, and was the dominant metal for swords, knives, axes, daggers, dress pins, and fibulae in the latter half of the 11th and the 10th centuries BC. The number of sites in Attica reaches a nadir in 1100 BC; but *c.*1050 BC there appears a new style of Attic pottery, the Protogeometric style, and a growing number of settlements on the east coast and inland become identifiable. This steady transformation of occupation after the sub-

Mycenaean period is reflected in changes to burial practices; in addition, at the end of the 10th century, sanctuary offerings start to appear, examples of which are found at the Academy in Athens and on Mount Hymettus.

The Geometric period (*c.* 900–700 BC) marks a rapid progression of developments in Attica. The number of known sites rises more than threefold between the 9th and the end of the 8th centuries. By 700 BC nearly half of the known Classical deme sites of Attica show signs of occupation. Despite the growth in evidence of monumental sanctuaries in the wider Greek world in the 8th and 7th centuries, Attica betrays fewer signs of such advances until later on. The 8th century is generally thought to be the time when Attica becomes a territory dominated by Athens; the widespread distribution of small settlements in the countryside is reflected by the large number of cemeteries found in the Attic countryside. These numbers fall in the 7th century and cult activity becomes the best indication of rural settlement. The 7th century is considered to be a time of revolutionary political changes in Attica: the mythical synoecism of Attica by Thesus may belong to the Geometric period or before, but the stories of family conflicts, the Cylonian conspiracy (*c.*630 BC), and the Solonian reforms of the early 6th century mark important periods in the history of Attica.

In the late 7th and 6th centuries political developments were centred on the control of power in Athens, and the reforms enacted there affected the whole of Attica. The unification of Attica as a political entity took place by the 7th century, and its subsequent history revolves around the relationship between the urban centre of Athens and its smaller, often rural communities. The power struggles of the 6th century, which present themselves as factional competition between groups, sometimes related by kinship ties, centre on regions within Attica (Herodotus, 1. 59). The experience of tyranny in Attica in the second half of the 6th century was not harsh. Many developments focused on Athens, but settlements outside the urban centre were improved during this period of growing prosperity and peace: Eleusis was developed with an impressive circuit wall and the Telesterion (the hall of the mysteries) took on the square hypostyle design which existed at the end of antiquity; the early developments of the theatre at Thoricus belong to this period; the temple of Apollo on Cape Zoster at Vouliagmeni dates back to this time.

The fall of the Pisistratids and the reforms of Cleisthenes of 508/07 transformed the political organization of Attica and so shaped the subsequent structure of the region's history. The people of Attica were formally arranged by demes, small village- or town-sized communities. A number of demes were located in Athens, but the majority of the demes were extra-urban. These 139 demes were allocated to 30 regional groupings (*trittyes*). Attica was divided into three groups of ten *trittyes*: there were ten *trittyes* from the coastal areas, ten from the plain or inland area, and ten from the city area. The grouping of demes into these local enclaves allowed some manipulation of territorial control. One *trittys* from each of the three areas made up a tribe, and there were ten tribes. This political reorganization of Attica ensured that for much of antiquity the history of Athens could not be separated from the history of its surrounding rural territory.

The central role of demes formalized the political standing of rural settlements. The Cleisthenic reforms produced a system of political participation which involved the whole population of Attica in the running of the polis, even if the seat of power was located in the urban centre.

Attica in the Classical period flourished and became one of the most densely populated regions in Greece. Exploitation of the countryside increased rapidly, and the extent of farming and animal tending in the 4th century saw activity on even the most marginal of land.

The major cult centres of Attica at Rhamnous, Sunium, and Eleusis underwent intense contruction work. New temples were also built at Acharnae and at Brauron. The insecurities created by the Peloponnesian War saw the construction of forts in Attica: Thoricus and Sunium were enclosed by defences, fortresses were built at Phyle and Panakton. The war had considerable impact on the Attic countryside. Pericles' defence of Athens during the Archidamian War (431–421) forced those living in the countryside to move into the city on a regular basis. The countryside was not abandoned completely, but there are signs of devastation: the Dema wall house is thought to have fallen into disuse during this period. The relatively brief summer invasions by the Spartan army during these years were less severe than the disruptions which the construction of a Spartan fort on Deceleia achieved between 413 and 403. The role of the harbour town Piraeus and the strategic roles played by Eleusis, Sunium, and Rhamnous were crucial to the security of Attica. Their functions became more formalized by the end of the 4th century and were to remain so for at least the next three centuries.

The archaeological evidence for settlement and activity in Attica peaks in the 4th century: epigraphic evidence for the erection of decrees, funerary material, and religious dedications all climax in this period. The decline of evidence and signs of activity in the 3rd and 2nd centuries is thought to suggest that people withdrew from the countryside and migrated to the city. But the continuing success of Eleusis and Rhamnous throughout the Hellenistic period and the importance of the countryside as a source of food supplies suggest that Attica remained relatively well populated in the 3rd to 1st centuries BC. Clear signs of decline in activity focus on the Laurium mining region which had been heavily populated in the 5th and especially 4th centuries. The exploitation of silver by Athens in this area attracted large numbers of slaves, industry, and farming. The decline of mining in the first half of the 3rd century, and the small level of activity from the late 3rd century onwards, mark a stark contrast with the Classical period. The occupation of Attica in the 3rd and 2nd centuries should not be based on the exceptional patterns of activity seen in Laurium; Heracleides Creticus, writing in the late 3rd century, described Attica as a fertile region with a large number of inns and good road networks, all of which indicates some level of rural occupation.

The Hellenistic period may signify a decline in the intense exploitation of Attica; the real drop in activity belongs to the late Hellenistic and early Roman period in line with many other rural areas in Greece. The virtual disappearance of settlement and activity in and around Panakton in the previously disputed area between Boeotia and Attica from 200 BC to the late Roman period symbolizes the reduced pressure on the

countryside in this period. The pattern of exploitation in marginal land in Attica is one way of calibrating the levels of activity in the area.

But the Roman period also sees an increasing revival in prosperity in other parts of Attica concentrated among a much smaller number of individuals. In the early 2nd century AD Herodes Atticus displayed his wealth in Athens but also developed Marathon as a personal estate. In contrast, some areas declined as the urban centre of Athens increasingly became the focus of expenditure: the Augustan period saw the removal of elements from the temple of Poseidon at Sunium into the rebuilt temple of Ares in the Agora at Athens.

In the late Roman period there is a brief intensification of activity in Attica, in line with general signs of revival in Athens. The Herulian sack of Athens in AD 267 and the subsequent decline of activity in Attica mark the gradual drift of the region from the prosperity of the Greek and Roman periods.

Invasions from the end of the 6th to the 8th centuries, however, delayed any revival. Byzantium had reasserted control in Greece by the middle of the 9th century and Attica began to rediscover some prosperity, enjoying greater security from the middle of the 10th century. In 967 Crete was recovered from the Arabs, thereby reducing the threat of raids in Attica. The formal establishment of Christianity in the 5th and 6th centuries AD had seen the construction of churches and the conversion of some ancient temples in Attica, and many new churches in the region date from the 11th to the 13th centuries. The monastery of Kaiasariani on the lower slopes of Mount Hymettus dates back to the 11th century. It escaped the imposition of taxation by the Turks following the conquest of Attica in 1456, and remained independent of Athens until 1716.

The Latin conquest of Constantinople in 1204 brought changes for Athens and Attica. The Burgundian knight Otto de la Roche was given control of Boeotia and Attica by Boniface III. Under Frankish rule Attica prospered for around 100 years. The countryside is still dotted with Frankish towers built during this period.

Frankish control was broken in 1311 and the region was under Catalan control for much of the 14th century. The Venetians wrested Attica from the Catalans in 1386 and remained in power until the Turkish occupation. Attica was annexed to the Ottoman empire in 1456, and stayed under Turkish control until the Greek War of Independence (1821–32). Athens was finally liberated and became the capital of free Greece in 1834.

The population of Athens expanded into Attica during the 1920s following the resettlement and exchange of Greek and Turkish peoples in 1923. During World War II Attica suffered considerably. The German forces occupied the area between April 1941 and October 1944. Koropi was the last village in Attica to be burnt down by the German army as it retreated from the coast. In December 1944 a communist revolution broke out in Athens. On the slopes of Hymettus there was fierce fighting between the British troops and the forces of ELAS.

The history of Attica cannot be separated easily from that of Athens, but its importance for the political development of Athens in antiquity cannot be underestimated. A number of major sites in Attica illustrate the wealth and success of the region. The modern development of Athens and its expansion into Attica confirm the symbiotic relationship which typified the dependence of Athens on Attica in the Classical period.

GRAHAM OLIVER

Summary

Attica, a peninsula protruding from central Greece, is the region surrounding Athens. In antiquity it provided the raw materials that were fundamental to the city's success—marble, silver, and crops. Attica was politically unified by the 7th century BC and reorganized by the reforms of Cleisthenes in 508/07 BC. Its prosperity declined in the late Roman period. It received an influx during the exchange of populations in 1923.

Australia

There were no Greeks among the first white settlers in Australia who arrived with the First Fleet in 1788. The first mention of Greeks on Australian soil, in 1818, is not a flattering one: a local newspaper in Sydney complained of rubbish being thrown in the streets by Greeks and other foreigners. The earliest Greeks in Australia were perhaps from the island of Cyprus. Most of the first Greeks in the Antipodes were

Australia: procession of Greek Australians celebrating their dual heritage

certainly from the Greek islands: Poros and Hydra, Ithaca and Samos, Rhodes and Euboea, Calymnos and Cos, Cythera and Castellorizo; those from the mainland were from the Peloponnese. At home they had been mostly either people of the sea (sailors, fishermen, and sponge divers) or else people of the land (farmers and shepherds). In Australia they worked on sugar plantations or in the mines; later they moved to the cities, where they managed restaurants or grocery stores. Although many of them were rapidly well established, it was not at all easy for the early immigrants, who worked hard in the hope someday of returning to Greece, a dream that was fulfilled only by a few. World War I and the Italian occupation of the Dodecanese islands sowed the seeds of an ever-increasing emigration. Almost all of the inhabitants of Castellorizo, for example, migrated overseas, most to Australia. After World War II the wave of migration continued unabated. In comparison to the difficulties faced by the earlier migrants, those who migrated during the 1950s, 1960s, and 1970s left their mark on Australian society, both socially and commercially, in spite of the fact that many of them first worked in factories. Today the Greeks are an integral part of Australia, holding important positions in government and society, and are well known for their contribution to commerce, politics, and education.

From the early 20th century, many of the islanders had

formed their own associations (or brotherhoods) in Australia. And though the first Greeks were unlettered for the most part, one Greek doctor opened a medical practice in Melbourne in 1902. The Greek press also began in Melbourne, in 1913 with the publication of *Afstralia* (the paper was later renamed *Ethnikon Vima*, under which name it still appears today). Other daily newspapers also appeared, such as the *National Herald* and, more recently, *O [Neos] Kosmos*.

The presence of Greeks in Australia, however, is particularly associated with the growth of the Orthodox Church. The early migrants quickly felt the need to build churches and to organize their social and spiritual life with adjacent halls and schools. It is this close connection of the Greek people with their Church that has accounted for the rapid development of educational establishments (on the primary, secondary, and even tertiary levels) and welfare institutions (especially the care of the aged). Any study of the Greeks in Australia is therefore inevitably linked to an understanding of the Greek Orthodox Church, but the close cooperation of the Greek people with their Church has at times been intense and contentious.

The historical development of the Greek Orthodox Church in Australia has been an increasingly significant feature in the life and culture of the Antipodes. Although it is difficult to discover the origins of Hellenism or of Orthodoxy there – there are very few clear references to them – the overall impact of the Eastern Orthodox Church is today easily perceived in a society where pluralism and multiculturism are not abstract humanitarian ideals but already, at least to a certain degree, realities of everyday life. The Greek Orthodox faith and Church, particularly after World War II, are not marginal phenomena in Australia, but have been gradually integrated into society at large. Before 1945 there were only 10,000 Greeks in Australia, while by 1950 there were 75,000, by 1960 there were 160,000, by 1970 about 400,000, and today more than 600,000. The Orthodox population numbers around 1 million, out of a total population of 17 million. Fewer than half of these were born in Australia, while fewer than 5 per cent have both parents born in Australia.

The first Liturgy in Australia – in Sydney, possibly during Bright Week of 1820 – was celebrated by a Russian Orthodox priest called Fr Dionisii, who was the chaplain on a ship that sailed to the Antarctic and round the world in the years 1819–21. But it was not until 1895, when a Greek priest named Archimandrite Dorotheos Bakaliaros arrived in Australia, that regular parish life appears to have begun. He travelled between Sydney and Melbourne, performing services in local town halls, but he had probably left Australia before the completion of the first Orthodox church, which was built in Sydney in 1898 and dedicated to the Holy Trinity.

The canonical jurisdiction and status of the first Orthodox churches are equally unclear. It appears that originally clergy were secured from the patriarchate of Jerusalem, which provided the communities in Sydney and Melbourne with priests during the early years. The first church in Melbourne was constructed in 1900. Two years later, the Church of Greece assumed spiritual responsibility for the churches in Australia, and began to send out priests for the pastoral needs of the Greek-speaking parishes. The earliest parishes served a multilingual congregation, and the clergy from Jerusalem were clearly well qualified for this purpose. In 1922 the ecumenical patriarch in Constantinople, Meletios Metaxakis, claimed jurisdiction over all the Greek Orthodox living abroad, and in 1924 he established the Greek Orthodox metropolis of Australia and New Zealand "for the better organization of the Orthodox Church" in that part of the world. The ecumenical patriarch has exercised spiritual authority over the Greek Orthodox Church in Australia and appointed its canonical archbishop ever since.

The Greek Orthodox Church (promoted to the status of archdiocese in 1959, and separated from New Zealand in 1970, when the latter was formed as its own metropolis) is divided into five archdiocesan districts, with local offices in the federal capitals, and has more than 120 clergymen, and more than 100 organized parishes with their own catechetical and afternoon language classes and community centres. The archbishop (since 1975 His Eminence archbishop Stylianos) is based in Sydney, and has three assistant bishops.

B

Babrius

Writer of fables of the 1st or 2nd century AD

Babrius wrote verse fables, 144 of which are extant in their original metrical form. In addition, two proems (prefaces) remain, which seems to indicate that the fables were originally published in two books. The first proem is dedicated to one "boy Branchus", the second to "king Alexander's son". These two addressees are probably one and the same person. It is, however, unclear with what historical king Alexander prince Branchus' father is to be equated. We do possess external termini ante quem: since Babrius' fables can be shown to have been well known by the early 3rd century AD, the author can safely be assumed to have lived in the 2nd or late 1st century AD; a still earlier date is excluded by the linguistic evidence. Quite unlike his predecessor Phaedrus (early 1st century AD), who was a Greek writing Latin fables, Babrius wrote in Greek, but was in all probability of Roman origin. This is indicated both by his very name, which occurs only in Latin and not in Greek inscriptions, and by a peculiarity of his metrical technique, accentuating each penultimate syllable, which is in accordance with Roman rather than with Greek prosody and stress. Babrius may have lived in the eastern (Greek-speaking) part of the Roman empire, more particularly in or near Syria. This is suggested by the literary and historically surprisingly exact ascription of the genre's origin to the Syrians (i.e. Assyrians) in the second proem. Further clues may be found in the author's professed personal experience with Arabs (57. 12), and in the oriental local colour of no. 8.

Babrius' fables are written in so-called choliambic trimeters (iambic trimeters with a long penultimate syllable). In both proems he selfconfidently states that he has "softened" the stinging iambs, by which he may be taken to mean that he has innovatively tempered the originally satiric connotations of choliambic metre. The fables' length varies considerably: on the one hand, the quatrain form is quite frequent, but the collection also includes a fable of 102 lines (no. 95). Many fables feature metrical epimythia, whose authenticity has sometimes unjustly been disputed. The collection has obviously been preserved incompletely, the alphabetic order in the principal manuscript abruptly ending with omicron.

The fables' subject matter is partly traditional and partly original, including all kinds of variations as well as fabulizations of mythological and other materials. Babrius seems to have drawn from a variety of sources. His narrative elaborations, psychological portrayal of protagonists, and mildly humorous tone are all stylistically idiosyncratic.

Babrius' fables enjoyed immediate popularity. A papyrus fragment dating from the early 3rd century AD (*Oxyrhynchus Papyri*, edited by B.P. Grenfell and A.S. Hunt, 1898–, 10. 1249) contains parts of four Babrius fables dealing with the theme of false judgement, which may be an indication that they were included in some sort of anthology used for moral education. That Babrius did soon become a school author is clear from various testimonies. First, the bilingual Graeco-Roman *Hermeneumata* ("Interpretations") by pseudo-Dositheus, which can be dated exactly to AD 207 and are explicitly composed "for lovers of Latin", contain 17 fables, 3 of which derive from Babrian prototypes. Second, 14 fables, 11 of which are in Babrian choliambs, have been preserved on the so-called Van Assendelft wax tablets (named after their Dutch buyer) from Palmyra (destroyed in AD 272); the many mistakes made in the Greek, as well as the very writing material, show that the fables served as a dictation given by a schoolmaster to a not-too-brilliant pupil. Third, we have a papyrus scrap (*Amherst Papyri*, edited by B.P. Grenfell and A.S. Hunt, 1900–, 2. 26; late 3rd or early 4th century AD) with fragments of three fables by Babrius, whose educational application is again clear from the accompanying Latin verbatim translation. Finally, another papyrus (*Bouriant Papyri*, 1; 4th century AD; edited by P. Collart, Paris: Champion, vol.1), undoubtedly a Greek language teaching method, starting with monosyllabic words, ends with part of the first proem of Babrius' fable collection.

Babrius' fables also found more literate readers. In a Greek letter (*Epistle* 82; AD 362) the Roman emperor Julian explicitly quotes from a book containing fables by Babrius. In addition, Babrius' collection is the principal source for the 42 Latin fables in elegiac distichs by the Roman fabulist Avianus (*c.*AD 400), who pays tribute to his predecessor in the prose preface to his verse collection dedicated to the erudite Macrobius Ambrosius Theodosius, future praetorian prefect of Italy (AD 430).

The fables' popularity lasted throughout the Byzantine period. First of all, the *Suda* lexicon quotes more than 50 times from Babrius to exemplify particular words, and even lists the fabulist under a separate entry – in a way the Byzantine predecessor of this essay. John Georgides included many *epimythia*

(concluding morals) from fables by Babrius in his *Gnomologium* (*c.*10th century). Two lexica (the so-called *Etymologicum Genuinum* and *Etymologicum Magnum*, dating from the 9th and 12th centuries respectively) exemplify two rare words (*omphax* and *pepromenon*) by quoting from two fables by Babrius. Two other lexica (Photios and, again, the *Suda*) paraphrase a Babrian fable to illustrate the meaning of a proverb (*tn kheira*). One fable (no. 141) is only (if incompletely) preserved by two rather late testimonies, the Byzantine polyhistor John Tzetzes (12th century) and the neo-Latin Natalis Comes (16th century).

An important witness of the collection's popularity is the large number (148) of prose paraphrases of Babrian fables. Many of these (more than 50) give the outline of fables not preserved in their original metrical form. In addition, Babrius is the primary source of the Byzantine *Tetrastichs*, a collection of 89 fable quatrains in quasi-ancient iambic trimeters or typically Byzantine dodecasyllabic verses, ascribed to Ignatios (Diakonos?; 9th century). Their author(s) may have found inspiration in the frequency of four-liners among Babrius' fables mentioned above. The *Tetrastichs* were widely read in the Middle Ages, as is demonstrated by the great number of manuscripts, many of them falsely proclaiming Babrius as their author, and even misspelling his name as Babrias, Gabrias, or even worse. Their alleged Babrian authorship has been taken for granted more than once; even the famous French fabulist Jean de la Fontaine states that he has used Babrius, whereas it can be shown that he really read the *Tetrastichs*, and that in a Latin translation. Conversely, a scholium on Thucydides (4. 92) quotes as if from Aesop two verses by Babrius, whose proems admittedly do stereotypically mention the legendary fabulist as a source of inspiration.

Three Byzantine manuscripts containing fables by Babrius are extant: A, G, and V, named after the libraries in which they once were, or still are, kept, on Mount Athos, in Grottaferrata, and the Vatican, respectively. The principal manuscript A (now in the British Library, Add. 22087; 10th century) contains 122 fables, which are, like the prose paraphrases and the so-called Aesopic fables, alphabetically ordered by their incipit; the alphabetization of the second proem (under *m*, as it begins with *mythos*) makes it a priori unlikely that this order is the author's. G (now in the Pierpont Morgan Library, New York, Cod. 397; 10th century) has – in addition to an important version of the *Life of Aesop* – 31 fables, 4 of which are preserved only here; V (Cod. Vaticanus Gr. 777; 15th century) has 30 fables, 12 of which are not in A.

Modern times have seen the gradual publication of Babrius' collection. The fables from A and V, as well as the wax tablets, *Hermeneumata*, and prose paraphrases, were first published in the 19th century, whereas G and the papyri reappeared only in the 20th century. The rediscovery of the Athonite manuscript in 1842 by Minoides Mynas and its subsequent first edition (edited by J.F. Boissonade, Paris, 1844) were a first-rate scholarly sensation at the time. The enthusiastic finder was inspired by his success to compose a series of fables in the manner of Babrius; his forgeries did mislead one editor (G.C. Lewis, London, 1846), but the pseudo-Babrius was soon unmasked as a jackdaw strutting with borrowed feathers. This curious little anecdote epitomizes a problematic implication of the fables' popularity. In view of the author's own complaint in his second proem that imitators "sneaked in when I first opened the door", those studying the many fables and paraphrases connected with his name should at least not rule out too easily the possibility that the accepted body of Babrius's work includes some forgeries.

Biography

Babrius lived in the 2nd or late 1st century AD, perhaps in Syria. He was probably of Roman origin but wrote verse fables in Greek, of which 144 survive in their metrical form. Prose paraphrases of more than 50 others survive. He remained popular throughout the Byzantine period.

Bacchylides

Lyric poet of the 5th century BC

Bacchylides, from Iulis on Ceos, was born around 510 BC and was active until the third quarter of the 5th century BC. A papyrus discovered in 1896 has preserved substantial remains of some 14 of his epinician odes (victory songs) and six dithyrambs (poems on heroic subjects). Bacchylides also composed hymns to the gods, paeans (hymns to Apollo), hyporchemes (songs for dancing), prosodia (processional

songs), partheneia (songs for maidens), erotica (songs of love), and possibly enkomia (songs of praise), of which only fragments remain.

Little is known of his life. The poetic talents of the young Bacchylides probably developed under the influence of his uncle Simonides, who composed in a similar range of genres. Like many Greek poets before him, Bacchylides enjoyed the attention of a wealthy prince. Three of his surviving epinician odes are addressed to Hieron, tyrant of Syracuse, and the poet must have spent time in Sicily in the 470s BC. Ancient scholars believed that Bacchylides and his contemporary Pindar rivalled each other at Hieron's court for the favour of the powerful ruler. Bacchylides and his poems were also well received in many other parts of the Greek world. Among the addressees of his victory odes were athletes from Ceos, Aegina, Athens, Thessaly, Phlius, and Metapontum; and his surviving dithyrambs appear to have been performed in Athens, Delos, Delphi, and Sparta.

Bacchylides composed his victory odes for performance in the victor's home town after his return from the games, or, in the case of shorter hymns, to be performed at the athletic festivals. The odes were performed by choruses, which danced or processed while singing the odes to the accompaniment of the aulos and/or the lyre. The poems typically contain a mixture of praise, aphoristic statements, and myth. Since an ode usually records the name of the athlete, the specific contest won (chariot race, wrestling, etc.), and the location of the competition (Olympia, Delphi, etc.), it functions as an announcement and commemoration of the victory. Also included in the poet's praise are the victor's family and city of origin. Scattered gnomic statements, expressing proverbial wisdom or beliefs, enhance and temper the words of praise: "no mortal is blessed in all things" (5. 53–55), "fame follows him whom the gods honour" (5. 193–94). The third typical component of the odes, the often extended narration of heroic myth, serves several purposes. The inclusion of myths is a form of praise for the poems' addressees, as some association is implied between the achievements of the athletes and the exploits of the heroes. In poem 13, for example, the games at Nemea are understood to commemorate the struggle between Heracles and the Nemean lion. Recollections of specific mythic figures sometimes reflect the noble past of a victor's homeland. Poem 1, composed for a Cean victor, tells the story of Dexithea and her son, the Cean hero Euxantius. Myths of the heroic past may also illustrate principles and beliefs. Poem 3 relates the miraculous rescue of the semi-mythological king Croesus as evidence that the gods reward generosity and piety.

The dithyrambs, intended for choral performance at religious festivals and competitions, narrate scenes from heroic myth. Perhaps Bacchylides' most famous dithyramb, ode 17, tells how Theseus, while sailing to Crete with Minos and the contingent of captive Athenian youths and maidens, descended into the sea to the house of his father Poseidon and received gifts from Amphitrite. The poem characterizes the hero as a champion of the Athenians, opposing the aggression of Minos, and the affirmation that Theseus was the son of Poseidon may reflect the growth of Athenian naval power in the Aegean between and after the Persian Wars. The subjects of Bacchylides' other dithyrambs include the embassy of Menelaus and Odysseus to Troy, Heracles' celebration of the capture of Oechalia, the arrival of the young Theseus at Athens, Io's escape from Argus, and the marriage of Idas and Marpessa.

Bacchylides drew upon a range of previous poetry for his mythic material. Prominent among these sources were the early epic poets, from whom Bacchylides adopted legends about Heracles, Menelaus, and Meleager. He quotes one aphorism directly from Hesiod, and other maxims recall Theognis and Solon. It is reasonable to assume that, in regard to style and manner of presentation, Bacchylides was heavily indebted to his uncle Simonides, a pioneer in the development of the victory ode, but the scanty remains of Simonides allow little comparison. Bacchylides shares in common with Pindar the use of myth and maxim, and he seems occasionally to have imitated his older contemporary, but the styles of the two poets differ significantly. Pindar favours daring metaphor and dense imagery, while Bacchylides prefers simpler modes of expressions. Bacchylides also prefers clear, linear narration of myth, as was the practice in epic. His introduction of dialogue into his narration is reminiscent of Homer and was probably influenced by Stesichorus.

Bacchylides found no immediate successor, and the types of choral lyric he composed waned in popularity as the 5th century BC progressed, but his poetry was remembered long after his death. Alexandrian scholars counted Bacchylides among the nine great lyric poets. He is mentioned several times in the scholia of Homer, Hesiod, Pindar, and others. He found an admirer and imitator in the Roman poet Horace. Quotations and references to Bacchylides in such authors as Longinus, Plutarch, Athenaeus, and Stobaeus attest to his enduring appeal, but the manuscript transmission seems to have been broken in the Roman period and his works were lost until the discovery of the papyrus in 1896.

MICHAEL J. ANDERSON

Biography

Born *c.*510 BC on Ceos, Bacchylides was active at least until 450 BC. He was the nephew of the poet Simonides and was no doubt influenced by him. In the 470s BC he spent time at the court of Hieron I, tyrant of Syracuse, where he may have been a rival of Pindar. Substantial fragments of poems in various genres survive, notably epinician odes and dithyrambs.

Bactria

Region of Central Asia

Annexed to the Persian empire by Cyrus II (Herodotus, I. 153), probably in the 530s BC, Bactria was an important satrapy of the Achaemenids, bordering on the Oxus river in the north, the Pamir mountains in the northeast, and the Hindu Kush in the south. In 522/21 BC the satrap of Bactria, Dadarshish, supported Darius I against the rebellious Armenians and quashed the uprising of neighbouring Margiana. His successor was Artabanus, who probably was satrap between 500 BC and 465 BC. Bactrian infantry and cavalry, equipped with reed bows and short spears, fought under the command of Hystaspes, a brother of Xerxes, in the invasion of Greece in 480/79 BC (Herodotus, 7. 64). Together with the Medes and Saka, the Bactrian contingent wintered in Thessaly in 480/79 BC under the command of Mardonius. In consequence of a palace intrigue Xerxes' brother Masistes, the *hyparchos* (subordinate governor) of Bactria, planned a revolt against the king in Bactria, but was killed on his way there (Herodotus, 9. 113). At the battle of Gaugamela Bactrian and Saka forces faced Alexander and his companions, marking them as the strongest force in the army of the Persian king. After his defeat Darius III tried to escape to Bactria, but he was killed by its satrap Bessus, who was also a relative of the king (Arrian, *Anabasis*, 3. 21. 5, 3. 30. 4). When Bessus assumed the Persian tiara and proclaimed himself king, Alexander immediately moved his army to Bactria to kill Bessus. The Bactrian capital Bactra, modern Balkh, was Alexander's residence in 329/28 BC before he continued his campaign against Sogdiana the following spring. Bactrian rebellion against Alexander in the summer of 329 BC lasted for two years, and when it was finally quashed, Alexander took 30,000 Bactrians and Sogdians as hostages.

Bactria was a wealthy province, profiting undoubtedly from trade between Persia and India, but also benefiting from fertile oases and pasturage. According to Herodotus (3. 92) Bactria paid an annual tribute of 360 talents of silver to the king of Persia. Reliefs at Persepolis show a Bactrian delegation bringing gold and camels as gifts to the king. The fact that several of Bactria's satraps were relatives of the king of Persia reflects the importance of this province for the Persian empire.

In the Seleucid period Bactria-Sogdiana formed a vast satrapy under one satrap, and was recognized as a wealthy province with valuable resources. In the 230s BC, led by the Greek Diodotus, Bactria revolted against the Seleucids and Diodotus proclaimed himself king. In 206 BC, after a two-year siege, Antiochus III was forced to recognize the Bactrian king Euthydemus. The Greek-Bactrian kingdom survived until 140 BC, when the Saka invaded Bactria, only to be expelled by a new power, the Tocharians, who invaded the country in AD 100.

Little evidence exists to elucidate the influence of Bactrian culture on the Greeks. While new foundations and extensive irrigation systems attest to the emergence of a growing Greek population in Bactria, the nature of the relationship between the local population and the new Greek-Bactrian rulers is difficult to establish. This uncertainty is illustrated by Ai Khanoum, a city of Greek foundation, complete with gymnasium and theatre, whose religious architecture, however, is distinctly oriental. Though Greek artists brought to Bactria much of the Greek style in art and architecture, they gradually assimilated new, local forms and styles. Bactrian Greek art was probably produced for the ruling elite, but must have existed alongside local traditions. Among the new species of plants introduced from Bactria to the Hellenistic world were the pistachio tree, which, according to Theophrastus, grew there (*Historia Plantarum*, 4. 4. 7).

MARIA BROSIUS

Summary

A region of Central Asia, Bactria was annexed to the Persian empire in the 530s BC. Bactrians fought alongside Persians in the invasion of Greece in 480/79 BC. After the Battle of Gaugamela Alexander took up residence at Bactra in 329 BC and put down a Bactrian rebellion. The Greek-Bactrian kingdom survived until 140 BC. A Greek city was built at Ai Khanoum.

Balkan Wars 1912–1913

The Balkan Wars were events of momentous importance to Greece. They mark the beginning of a decade of war and expansion, a decade during which Greece would come very close to the realization of the territorial aspect of the Great Idea. However, the Balkan Wars were also the natural culmination of the Macedonian struggle and one of the last phases of the Eastern Question.

The First Balkan War broke out in October 1912 and ended with the Treaty of London in May 1913. It was the natural outcome of the network of treaties concluded (or, in the case of the Graeco-Serbian treaty, discussed) between Bulgaria, Greece, Montenegro, and Serbia during 1912; the initial moves

8. The outcome of the Balkan Wars, 1912–13

were made as a result of Russian initiatives, but the events soon moved away from Russian control. The result was a military alliance between Bulgaria, Greece, Montenegro, and Serbia, directed against the Ottoman empire.

Hostilities began in October 1912, following a prearranged schedule whereby Montenegro declared war on the Ottoman empire and the other three Balkan states mobilized and followed suit. During the First Balkan War the numerical superiority of the allies was crushing. What resulted was victory for the allied armies. Greece made quick progress, invading Epirus and Macedonia and advancing rapidly on all fronts. On 26 October 1912 the Ottoman commander of Thessalonica surrendered the city to the Greek army. Greek army units also laid siege to Ioannina, the principal city of Epirus. The Greek navy quickly established superiority in the Aegean, stopping the Ottomans from transporting troops by sea from Anatolia and also liberating the islands of the eastern Aegean Sea. Crete once more proclaimed union with Greece. The other Balkan allies were equally successful; by May 1913 the Great Powers put an end to the conflict, forcing the belligerents to sign the Treaty of London. With this the Ottoman empire ceded all territory west of a line between Enos and Media (both points in eastern Thrace) to the victorious Balkan allies.

The problem facing the allies was now the division of the spoils. The territorial clauses of the Serbo-Bulgarian treaty left territory unassigned, while no territorial clauses had been included in the Graeco–Bulgarian treary. A further complication arose out of the creation (at the insistence of the Great Powers) of an independent Albanian state, whose territories figured in the aspirations of the allies. Bulgaria, however, was dissatisfied with the outcome of the war: Bulgaria felt it had borne the brunt of the fighting, while its territorial gains were disproportionate to its contribution; clashes had already begun during the war between Bulgarian and Greek units (with fighting breaking out in Thessalonica and elsewhere) as well as with the Serbs. Fear of Bulgaria led to secret discussions between Serbia and Greece, with a secret treaty signed between the two countries in June 1913. It was a very timely action: within the month the Bulgarians attacked both the Greeks and the Serbs in an attempt to break the front and separate the two armies, thus sparking off the Second Balkan War. The attack failed; Serbia and Greece were soon joined in the war against Bulgaria by the Ottoman empire which seized the chance of recovering territory occupied by Bulgaria (including the city of Adrianople); and by Romania, which invaded Bulgaria from the north. Within a month the war was over. With the Treaty of Bucharest, concluded in August 1913, Bulgaria lost territory to Serbia, Greece, Romania, and the Ottoman empire; it lost the city of Kavalla (which had been given to it after the First Balkan War), though it retained an outlet to the Aegean Sea including the city of Dedeagach (Alexandroupolis).

For Greece, the Balkan Wars were highly successful. Greece acquired the whole of the southern Macedonian lands, most of Epirus (with the exception of the northern part) and the islands of the eastern Aegean including Lemnos, Chios, Lesbos, and Samos as well as Crete; the islands of Imbros and Tenedos (whose population was Greek, although occupied by Greece during the First Balkan War), were put at the disposal of the Great Powers, and were eventually given to Turkey. Greece increased its land area by some 70 per cent and its population rose from 2.8 million to almost 4.8 million. The important cities of Thessalonica (the major port of the Balkans), Kavalla, and Ioannina were incorporated in the kingdom, along with rich and fertile lands. The success of Greece in the war also took it considerably closer to the realization of the Great Idea, though there were now obstacles in further expansion (not least the Bulgarian outlet to the Aegean, which blocked potential Greek eastward expansion towards Constantinople). Greece was also faced with the major problem of the integration of the new territories into the kingdom; this was not easy, given that considerable parts of the population of these territories were non-Greek. The task would be delayed by the outbreak of World War I and would only be completed in the aftermath of the Asia Minor disaster in 1922. The conflict between expansionists and those who advocated integration of the newly acquired lands before further territorial expansion would also be one of the causes that gave rise to the national schism. More generally, the Treaty of Bucharest created a lasting resentment in both Bulgaria and the Ottoman empire, a resentment that would decisively influence their choice of allies in World War I and subsequently.

Banking

Banking in Greece is, as M. Rostovtzeff remarks, "as ancient as the use of a coinage issued and guaranteed by the state". The earliest bankers (*trapezites*), the money-changers, sat behind their tables (*trapezai*) in the streets and marketplaces of ancient Greece ready to exchange coins of other cities. If the banking business is loosely defined as the storage of valuables and the lending of money at interest to borrowers, then the first primitive banks of Greece can be considered to be the temples. Since they were recipients of the offerings of the devout and because their sacrosanct character made them ordinarily safe from pillage, it is easy to see how this form of business began. Funds deposited in temples remained untouched and cash was lent from the temples' own funds to states, and also apparently – although the evidence is not certain – to individuals. The temple of the goddess Athena at Athens, for example, lent money to the state between 433 and 427 BC at 6 per cent. It must, however, be emphasized that the temples never operated a general banking business; that was left to private individuals.

The earliest mentioned banker in Greece for whom we have proper evidence is one Philostephanus of Corinth, who received a deposit of the considerable sum of 70 talents from Themistocles. In the 4th century BC we know the names of about 20 Athenian bankers. But banking in ancient Athens was a small private concern, never a great international system, organized and carried on in a modern way. The never-ending wars of ancient Greek cities and the great danger that pirates constituted to foreign trade made international banking impossible. Even among towns in the same state there were no banking facilities. The cheque and the bill of exchange were unknown.

The banking operation in Athens, like nearly all other commercial activities, was performed mainly by metics (people not native to the city). For this reason, bankers were sometimes considered marginal to society. The most famous and wealthy ancient Greek banker was Pasion (d. 370/69 BC), a former slave. Although there were rich and famous bankers, yet money-lending and foreign exchange operations were, to a large extent, carried on by usurers. Interest rates of 30 per cent were not uncommon, especially for loans made to merchants and shipmasters for the furtherance of commercial ventures in overseas trade.

In addition to temples and individuals, some city banks existed (in the case of Athens the evidence is not strong). Miletus, for example, known for its financial strength, instead of having recourse to private bankers or temples for its money transactions, created a state bank. A further step was the establishment of a state bank monopoly.

The banking business, despite its local character and the absence of foreign operations, was relatively well developed in the ancient Greek city states, a characteristic that was later inherited by the banks of the Hellenistic world. One of the new principal features of that period was the rapid spread of city as well as temple banks, the best known of which were those of Cos, Ephesus, and Sardis. Although the evidence is not abundant, we know that temples in the Seleucid empire were highly respected at least in the early times of the dynasty. When, because of financial difficulties, some Seleucid emperors required the surrender of temple wealth, the action provoked a fierce reaction from the citizens because the bulk of the money consisted of private deposits.

The Ptolemaic banking system, on the other hand, assumed a peculiar and unique character. Its chief novelty was the centralization of banking by the creation of a state bank in Alexandria. Private banks played a secondary role in the economic life of Egypt. The Ptolemaic central bank was organized on a Greek pattern and in general was not very different from a regular city bank. Because the bank was an institution whose primary business was the custody and investment of the state's money and sometimes the collection of taxes, the interests of private clients were of secondary concern to it. Given the guarantees needed by the state bank to finance private ventures, individuals in need of money almost certainly had recourse to private banks. As a consequence of its good management, citizens preferred to deposit their money in it. The kings were not opposed to this extension of the activities of the bank as it meant an increase in their income and involved very little risk. In addition to these activities, the bank had dealings in corn, since corn in Egypt was almost an equivalent of money. The government's granaries were effectively a network of corn banks with their centre in Alexandria. They were managed by a special staff, who had the same functions as the bankers; namely, they acted as intermediaries for either state or private corn transactions. The Ptolemaic banking system did not disappear with the rule of the Ptolemies. It was retained with some modifications by the Roman administrators of Egypt and it influenced the Roman and Byzantine system of tax and rent collection.

Byzantium did not have a state bank like the Ptolemaic banking system, either because of the financial fragility of the Byzantine state or for religious reasons, since for Christians it was highly unethical to lend money at interest. The treasury, whose main business was the management of state money and the collection of taxes, effectively performed some of the activities of a central bank. The money market was strictly controlled by the government, in particular by means of measures limiting the rate of interest. In the 4th century the legally permitted interest rate was 12.5 per cent, though this did not mean that a higher rate could not be obtained. Short-term loans for foreign trade that involved higher risks could command more than 50 per cent. The law did not recognize this rate, however, and it could not be enforced in a law court.

It appears that bank credit was often used, particularly for covering the cost of military undertakings, and that taxes under collection were used as security. After Justinian's death in 565, his successor had first to cover the banking debts of his predecessor. One way of dealing with such problems was by confiscating the property of political opponents who had to face prosecution after a change of government. Another characteristic of the Byzantine banking system was that all bankers had to belong to a corporation. This was also true for every important business activity in order for the state to control and tax it effectively.

During the last centuries of Byzantium Constantinople was undeniably the financial centre of the empire, while its bankers, not only Greeks but also Italians and Jews, were the most wealthy and famous inhabitants. It was normal to make loans using foreign currency; these consisted of exchange contracts on which the interest was in fact hidden in the exchange rate established. Cheques or promissory notes began gradually to be used. These were commonly employed by the Latin bankers but were also introduced and largely adopted by the Byzantines. The bankers of the late Byzantine empire, especially those with big foreign and domestic operations, had undeniable economic power, but in contrast with the Latin west they never succeeded in creating real public banks. Despite their ability to handle every known type of financial transaction of their time and to engage in spontaneous business ventures that promised to be profitable, they remained private institutions. The same is true even after the fall of the empire to the Ottomans.

In the first years following the Turkish conquest, Greek bankers had no formal operations because of the expulsions and the absence of any commercial activity, although usury never disappeared. Gradually rich Greeks, Jews, and Armenians began to invest their capital in money lending since the velocity of money circulation in the Ottoman empire was slow and credit was the usual method of payment in trade. These bankers had accumulated their wealth through commerce and were engaged in every economic activity deemed profitable, not only money lending.

In Constantinople the Phanariots provided most of the bankers. They were Greek nobles who had many privileges granted to them by the Porte. They were highly educated and became senior officials of the Ottoman state such as secretaries, interpreters, and ambassadors. The Phanariots had very good relations with the Porte and some of them became bankers to the sultan. The main requirement for anyone desiring to be engaged in banking operations was the availability of capital. But sometimes it could be done even without capital, as was occasionally the case with Albanians who borrowed money from Jewish bankers. The Albanians had no difficulty in raising money for their speculations because they had established themselves as being of good character in their financial affairs.

No particular laws regulated the interest rate, which therefore fluctuated greatly according to the creditworthiness of the borrower and the security posted. Loans to the state had a 10 per cent interest rate; those made to European merchants in Smyrna also had a 10 per cent rate. In Greece the rates varied from 10 to 30 per cent according to the creditworthiness of the customer. Maritime loans, being less secure, bore a higher interest rate, between 17 and 50 per cent, depending on the vessel's destination and the season in which the voyage took place. Bankers' profits were not only derived from the rate charged on loans but also from some arbitrary practices of the Turkish authorities, such as the payment of tax prior to the harvest in order to favour money-lenders. The peasants therefore had no alternative but to borrow money until harvest time and usually on the condition that bankers could buy their produce at a price between 2 and 6 per cent lower than its market value.

At the time of the Greek War of Independence (1821) organized banking facilities in Greece operated only in Thessalonica and the islands of Hydra and Spetsae. The preferred way of transferring large amounts of money as well as financing the purchase of merchandise was the bill of exchange. Bankers advanced loans to traders with security for the commodities and received bills payable over a period ranging from one month to two years. Although in Constantinople the cashing of bills was a common operation, in Athens such facilities did not exist until 1817.

Greek banking during the years of Turkish occupation is characterized by the personal nature of the business and by the absence of banks such as existed in western Europe. This situation gradually changed with the establishment of an independent Greek state. The first bank in Greece was established in 1828 under the name National Financial Bank (Ethniki Chrimatistiki Trapeza). It was a state institution issuing securities on behalf of the Greek government and had no other operations, but it failed to gain confidence and ended its operations about six years later. The second serious attempt, a successful one, was the founding in 1841 of the National Bank of Greece (Ethniki Trapeza tis Ellados). Initially the main operations of the bank were the issuing of currency, the trading of debt securities, and the granting of mortgages. By the end of the century the institution had expanded its operations to all types of transactions and activities related to banking and had become the most important Greek bank, a position that it still holds. A large number of banks were founded during this period, but apart from one or two, most were of a regional or personal character. Because of their inadequate capital base and limited revenues, they failed to survive and either ceased operations or were acquired by the big ones. The main reasons for this development were: the absence of government regulation and intervention, and the tendency of the financial institutions to perform indiscriminately every banking activity without being specialized in core operations.

In December 1927 the Central Bank (Trapeza tis Ellados) was established with its main business being the issuing of currency, a task performed until then mainly by the National Bank of Greece among its other activities. Moreover during this period two other specialized financial institutions were founded, the National Mortgage Bank (Ethniki Ktimatiki Trapeza) in 1927, a former subsidiary of the National Bank of Greece, and the Agricultural Bank (Agrotiki Trapeza) in 1929. These two banks specialized in real estate and agricultural credit respectively, operations that had been performed mainly by the National Bank of Greece. After World War II the transformation of the Greek banking industry continued, with a reversal of the tendency to create small banking units of

regional character, as well as with the adoption of modern Western banking practices.

Baptism

The literal meaning of the Greek word *baptizo* is "immerse" or "dip in" and it is in this sense that the word occurs from the time of Hippocrates. In antiquity, however, the word is found in a sacral context only occasionally and did not acquire a technically religious meaning. There are some early examples of sacral baths, such as those found in the Eleusinian cults (5th century BC) and in Bacchic consecrations. Yet the underlying motive of sacral washings in Hellenism is that of bathing, washing, or cleansing. Later on, the notion became spiritualized and ritual immersions acquired in Judaism the meaning of purification. St John the Baptist first gave an eschatological orientation to baptism by relating it to penitence and the forgiveness of sins (cf. Mark 1: 4–8). From then on, the belief became common that a ritual absolution that signified a desire for purity of soul and the forgiveness of sins will be effaced by God in the same manner as corporeal dirt, i.e. by the use of water.

In Christianity baptism occupied a place of utmost significance from the very beginning. In the New Testament baptismal immersion was linked to Christ's death, burial, and resurrection (cf. Romans 6: 3–4). This is the reason why baptism in the early Church took place during the Easter vigil, thus emphasizing its final aim, regeneration and eternal life. Moreover, because baptism is connected with Christ's death, who "died to sin once for all" (Romans 6: 10), it is administered only once. Subsequently, the meaning of baptism was enlarged even further to signify incorporation and integration into the Church.

In the early Church there was a lengthy process of initiation for the catechumens for baptism, which lasted up to three years. However, by the middle of the 2nd century, infant baptism became common practice. Yet the baptismal rite retained the final part of the "catechumenate" and incorporated it into the service. Thus the Orthodox rite begins with the exorcism of Satan and the evil spirits of error, wickedness, idolatry, covetousness, the renunciation of evil, and the confession of faith. Previously all these were pronounced by the adult catechumens before baptism. Since infant baptism was established, that part of the service has been fulfilled by a spiritual guardian or godparent who acts on behalf of the infant. It is popular practice in Greece for the godparent to stand for children only of the same sex, since it is believed that children who have the same spiritual guardian are spiritual kinsmen. Such children are regarded therefore as "brothers" and "sisters" and marriage among them is prohibited. Here spiritual unity becomes the binding element between the two persons, thus emphasizing spiritual kinship as superior to biological. From the time of baptism onwards, the child's "religious education" should ideally be carried out by its godparent, its family, and the Church. At the beginning of the service the priest also asks the godparent the name of the infant. In Greece an infant remains unnamed until the actual day of baptism. Usually Greek children are named after one of their grandparents, thus pointing out the continuity of life even after death and the regeneration of generations.

The baptismal sacrament proper begins with the blessing of the water in a long prayer recited by the priest. The surface of the water is signed with sanctified olive oil and the godparent anoints the infant with this oil. Both water and oil are life-giving substances. Their use in baptism signifies the redemption of matter; they are the medium through which communion with God is achieved.

The priest, invoking the name of the Holy Trinity, baptizes the child by three total immersions and emersions. This triple act symbolizes Christ's three-day burial and resurrection. The baptismal font becomes the tomb in which the baptized is immersed or "buried" and from which he or she is immersed or "raised up", so that he or she may walk in newness of life (cf. Romans 6: 4). The baptismal font, however, is also, in the words of the Church Fathers, the "Divine Womb" whence one receives a new birth. Thus, baptism introduces the Orthodox to a new mode of existence, to a regeneration, and to the transcendence of his or her biological "hypostasis" (cf. J. Zizioulas).

Baptism: 5th-century mosaic of the baptism of Christ, Baptistery of the Orthodox, Ravenna

An essential difference between the Orthodox and western liturgical practices is that in the Orthodox rite the sacraments of baptism and chrismation or confirmation are merged together. Chrismation is the sacrament of Pentecost. For the Orthodox it is not a separate sacrament but the fulfilment of baptism, as indeed Pentecost is for Easter. Through chrismation human nature, purified by baptism, receives the gift of the Holy Spirit. The priest anoints the various parts of the infant's body – forehead, eyes, nostrils, lips, ears, breast, hands, and feet – with chrism (*myron* in Greek). Chrismation is considered to be the "ordination of the laity"; through it the baptized infant becomes a full member of the Christian community.

In the early Church baptism and confirmation were not administered in the church but in a separate place called the *baptisterion* (baptistery). Following chrismation, the newly baptized were dressed in white robes, symbolic of the "newness of life", and were led by the clergy for the celebration of the Eucharist, where they received their first Holy Communion. Today also baptism and confirmation are followed by a procession of the priest, accompanied by the godparent holding the newly baptized infant, round the baptismal font. The fulfilment of baptism and chrismation is found in the Eucharist. For three consecutive Sundays the neophyte will receive the sacrament of Holy Communion. In the early Church the neophytes remained in the church for eight days. This "rite of passage" ended on the eighth day with the washing of the holy chrism, the cutting of the hair, and their return into the world.

Although the above description points to the prevalent form of baptism in Orthodoxy, there also exists what is known as "clinical" baptism. When a person is seriously ill and has not been baptized, then baptism may be administered by any baptized Christian either in the air or by affusion. But such a form of baptism, though necessary in certain circumstances, is considered as imperfect and is administered only by the use of "ecclesiastical economy", i.e. concession or dispensation. The Orthodox also regard the Latin baptism as incomplete, because it is not done by immersion but by sprinkling. Since the middle of the 18th century a big debate has been created in the Orthodox Church on whether western converts should be "rebaptized". It was held that sprinkling alone was inadequate for conveying to the baptized person the regeneration achieved through immersion. The debate still continues today. However, the usual practice – since 1932 when archbishop Chrysostomos I introduced into the Euchologion the "Service of Conversion to Orthodoxy from the Latin Church" – is for baptized Christians of other Churches to be received in Orthodoxy by chrismation alone. Finally, it is worth noting that a symbolic "second baptism" is part of the tonsuring ritual of the monastic profession.

Barlaam of Calabria *c.*1290–1348

Theologian

A native of Seminara in Calabria, Barlaam had his initial formation in a Greek-rite monastery, perhaps at St Elias of Galatro. There he studied Greek and Latin, the philosophy of Plato and Aristotle, and Western scholasticism. He arrived in Constantinople around 1328, seeking a closer knowledge of both the Byzantine Church and the Hellenic philosophical tradition. Court favour won him a chair in theology and patristic exegesis, and his lectures soon attracted a wide audience, including Gregory Akindynos. His success attracted the rivalry of Nikephoros Gregoras. For a time he taught in Thessalonica, where his pupils included Demetrios Cydones.

Barlaam was the only theologian in the empire deemed capable of dealing with the Dominican legates of pope John XXII sent in 1333. To them he gave an able defence of the single procession of the Holy Spirit from the Father, pointing out that the Latin syllogistic arguments were not strictly apodictic, or demonstrative, according to the definition of Aristotle. It was as this time that his disputes with St Gregory Palamas began, Gregory becoming uneasy with Barlaam's theological method. Barlaam, examining the methods of prayer used by the hesychast monks, found their physical method strange and even scandalous. He began to draw attention to the abuses he perceived, notwithstanding the protestations of Akindynos. Forced to withdraw from the capital, he continued his campaign in Thessalonica, provoking Palamas's first *Triad in Defence of the Holy Hesychasts*.

Returning from an abortive mission to gather support in the West for an anti-Turkish crusade in 1339, Barlaam found Palamas's second *Triad* to which he replied with his *Against the Messalians*. This in turn instigated Palamas's third *Triad*. Again ignoring the counsel of Akindynos, Barlaam formally accused the hesychast party at the Constantinopolitan synod of June 1341. He was soon put on the defensive, his accusations against the hesychast monks being deemed groundless and his explanation of the light of the Transfiguration inconsistent with the patristic witness. With the death of Andronikos III, his patron, Barlaam was almost entirely isolated, and left for the West. He was consecrated bishop of Gerace in Calabria in 1342. He returned to Constantinople only once, in 1346, as leader of a fruitless papal mission to Anne of Savoy that was overtaken by events. He died in 1348.

Barlaam was a prolific writer. Against the Latins he produced 18 works on the procession of the Holy Spirit and 3 on papal primacy. One of his works on the Holy Spirit was directed specifically against Thomas Aquinas. His arguments are chiefly based on philosophical reasoning. His anti-Palamite polemic survives only in fragments, with some further information contained in his surviving letters. He was accused of denying that God really differs from his operations and teaching that the light of the Transfiguration was created. After his return to the West, Barlaam also produced Catholic apologetic. His *Reply to Demetrios Cydones*, which is edited, is a good example. Less well known are his philosophical and scientific works. He composed a work on Stoic ethics, and addressed a series of philosophical solutions to George Lapithos, the Cypriot scholar. Lastly we must mention his works on astronomy, his highly regarded works on algebra and arithmetic, and his treatise on the celestial harmonies in music.

Barlaam has been ill-served by posterity. His reputation in the East has been blackened out of recognition. In the West he has been seen as overly vacillating. Palamite sources have characterized him as a Western stooge or fifth columnist. This is unfair. Barlaam was certainly familiar with Western scholasticism, but exhibited no great sympathy for it in his Byzantine period. His treatise against Thomas Aquinas demonstrates this. In fact, up to 1341 he was a more committed anti-Unionist than was Palamas. Barlaam's theological method was greatly influenced by Aristotelian argument. He was also well versed in Plato and the traditions of Neoplatonism. He was particularly indebted to Dionysius the Areopagite.

Barlaam's influence has naturally been restricted by the canonization of Palamite theology. Even the anti-Palamite faction of Akindynos repudiated him. Barlaam did, however, retain a small circle of supporters in Byzantium, the most notable of them being Demetrios Cydones, the Byzantine Thomist. His anti-Latin works may have furnished some material for the anti-Unionist party in the last hundred years of the Byzantine empire. Equally, his Catholic apologetic appears, through Cydones, to have influenced the Unionist party.

Biography

Born at Seminara in Calabria *c.*1290, Barlaam became a monk in Italy and studied the ancient philosophers as well as Western scholasticism. He moved to Constantinople *c.*1328 where he became a professor of theology and patristic exegesis. His attacks on hesychasm and St Gregory Palamas divided the Church and Barlaam

returned to the West where he became Bishop of Gerace in 1342. He died in 1348, perhaps at Avignon.

Basil I *c.*830–886

Emperor

The figure of Basil I (867–86) is prominent in Byzantine history because he was the founder of the so-called Macedonian dynasty, which lasted from 867 until the death in 1056 of its last representative, the empress Theodora. Basil had risen to power as a favourite of the emperor Michael III (842–67) of the Amorian dynasty, and seems to have been of humble origin, a fact reflected in both the panegyrical *Vita Basilii* and the hostile Logothete chronicle tradition. As the son of peasants Basil was not the recipient of an elite education, and as emperor he seems to have been intellectually primarily dependent on Photios. On his accession to sole power in 867 Basil had at first removed Photios from the patriarchate and exiled him, only to recall him to the palace and later re-establish him as patriarch in 878, which position Photios still held on Basil's death in 886.

Photios is well known as the explicit source of the crucial cultural monuments of the 9th century, such as the *Bibliotheca*, his letter of advice to the recent Christian convert Boris of Bulgaria, and his own collection of homilies. Photios's hand can also be detected in other endeavours designed with the Macedonian dynasty in mind, such as the illustrated manuscript of the homilies of Gregory of Nazianzus (Paris, Bibliothèque Nationale, gr. 510), which contains portraits of Basil, his wife Eudokia Ingerine, and their sons Leo and Alexander.

Basil's name is, however, attached to the two parainetic texts from his reign, written as if by him to his son and heir Leo VI. Of these two texts the first and earlier is the better known. They are inspired by previous examples of the genre of advice such as Isocrates' *To Nicocles* and *To Demonicus*, but most notably by the 6th-century *Ekthesis* of Agapetus, deacon of Hagia Sophia, which was addressed to the emperor Justinian I (527–65). They probably date from 879 and 886 respectively, the first on Leo's elevation to the position of heir apparent, the second on his restoration as heir apparent following his disgrace and confinement. Given Basil's lack of literary ability it is unlikely that he was the real author of the texts, and Photios's hand again has been suggested, especially for the *First Parainesis*. This text is closest to the model of Agapetus. It is divided into distinct chapters, having 66 compared to the 72 of the *Ekthesis*. The acrostic device used by Agapetus is also used, spelling out the message *Basil Emperor of the Romans in Christ for His Beloved Son and Co-emperor Leo*. Unlike the work of Agapetus, each chapter is given an individual heading, setting out its theme. The second text is much shorter, has no acrostic, and is not subdivided into topics, but again consists of the typical ideological and moralistic reflections, and exploits in particular the Old Testament Wisdom literature. The texts together reflect the vogue for parainetic and didactic texts, but more particularly for the achievements of the age of Justinian – reflected in the art of the reign (triumphal images of Basil recalling those commemorating the military victories that marked the reign of Justinian) but especially in the interest in, and production of, legislation under Basil.

The main project of Basil's reign was the endeavour to revise and produce the essential version (in Greek) of the Roman *Corpus Juris Civilis*, that is, the collection of legal texts issued under Justinian, namely the *Institutes*, *Digest*, *Codex*, and his own *Novels* (these were issued in Greek from the beginning). This exercise, resulting in 60 books, seems to have been completed under Leo VI (886–912), and became known as the *Basilika*, or the imperial laws. As a preliminary and introductory volume to the *Basilika* there appeared under Basil, Leo, and Alexander (912–13) the *Epanagoge* (or rather *Eisagoge*); here too Photios's hand can be detected, for it seems likely that he contributed the preface and the individual titles on the emperor and the patriarch. The *Procheiron* (a practical law book drawing on the *Institutes* and the *Ecloga* of Leo III (716–41), issued in the names of Basil, Constantine – Basil's eldest son, who predeceased him in 879 – and Leo), has been identified by Schminck as a later reworking of the *Epanagoge* by Leo VI, though some (e.g. Lokin) would still see it as an authentic Basilian text.

Thus, as far as the Hellenic tradition goes, Basil himself was not such an active figure; his virtue is that he provides the opportunity for others. Indeed one could say that Basil's career and circumstances provided the greatest inspiration. He was of low origin, his accession as emperor was not without scandal, and as such he needed much ideological weight thrown behind him. Thus poets, writers, orators, intellectuals, artists, and builders (not just Photios) were inspired to come to his aid and create a very special atmosphere in the 9th and 10th centuries. Basil is the focus of such celebratory works as poems by Photios, the *Epitaphios* of Leo VI, the *Vita Basilii* commissioned by Constantine VII Porphyrogennetos (913–59), and Basil's own important ecclesiastical foundation the Nea Ekklesia ("new church"). This latter was Basil's major ecclesiastical foundation, built within the Great Palace and dedicated in 880. The richly decorated five-domed church had as its divine dedicatees Christ, the prophet Elijah (Basil's particular divine patron it seems), the archangel Michael (perhaps originally Gabriel), the Virgin and St Nicholas. Basil's building projects are recorded most extensively in the *Vita Basilii*. These entailed the repair and restoration of many of the late-Antique churches of Constantinople (including Hagia Sophia, the Holy Apostles, and St Mokios), and also the construction of new structures, especially in the imperial palace itself, which in addition to the Nea Ekklesia included a courtyard with fountains, porticoes enclosing a garden, a polo ground (the Tzykanisterion), and imperial apartments. The most famous of the apartments is the Kainourgion which was decorated with

mosaics, including depictions of the emperor and his labours, his generals and their military successes, and the imperial family.

All these projects aspired to present Basil as a God-favoured emperor, whether as a new David or a direct descendant of both Alexander the Great and Constantine the Great. It was the creation and establishment of a new dynasty that provided the impetus for the literary, artistic, architectural, and legal projects of the age, and this is the cultural legacy of Basil I.

SHAUN TOUGHER

Biography

Born of humble stock in Thrace or Macedonia *c.*830, Basil achieved power as a favourite of Michael III. On Michael's murder in 867 Basil became emperor and founder of the Macedonian dynasty. During his reign his armies campaigned in the east and in Italy, but his main project was the attempt to revise and codify the law. He died in Constantinople in 886 after a hunting accident.

Basil II 958–1025

Emperor

Basil II (976–1025) is generally considered the greatest of all the Byzantine emperors. He was a successful military leader whose campaigns brought the empire to its greatest geographical extent. He spent much of his early life under the regency of his mother, the empress Theophano, and a series of military strongmen. Upon the death of John I Tzimiskes (969–76) Basil, now 18, decided to assert his rights to the throne. Bardas Skleros, the former *domestikos* (commander) of the east under John Tzimiskes, rose up to challenge him. By 978 he had seized control of most of Asia Minor. Basil Lekapenos, the grand chamberlain, turned to Bardas Phokas for help against Skleros. At Pankaleia in 979 Phokas defeated first Skleros in a single combat and then his entire army. Despite Basil's success, power continued to be exercised by Lekapenos until his exile in 985, after which the emperor assumed total control of the government. Basil's brother, Constantine VIII, showed little interest in ruling and spent most of his time in extravagant pleasures. Later, in 987, after Basil's defeat by the Bulgarians at Trajan's Gates, the nobility rose up against him, the chief leaders being Bardas Skleros and Bardas Phokas. Both rebels had widespread support among the senior officers of the army and the landed nobility. Originally Phokas and Skleros agreed to share the empire between them, but later Phokas had Skleros arrested and, having brought all of Asia Minor under his control, prepared to attack Constantinople. Basil was only able to defeat Phokas with the help of Vladimir I of Kiev, who sent 6000 troops to support him. These troops would later become the nucleus of the famous Varangian Guard. In return for his timely aid, Basil gave his sister Anna to Vladimir in marriage, an act that also led to the conversion of Russia to Orthodox Christianity.

The revolts of Phokas and Skleros had a lasting impact on Basil and he continued to be suspicious of the military aristocracy. As a result he decided, in 996, to restrict the power of the *dynatoi* by issuing new legislation on the alienation of soldiers' land. He repealed Nikephoros Phokas's earlier legislation which limited monastic landholding, mainly because he felt this law worked more in the interests of the landowning class, and issued new regulations restricting monastic lands. Small houses of eight monks or fewer that stood on peasant land were subordinate to the village community but exempt from paying tribute to the bishop, while larger houses were made subordinate to the bishop but could make no new acquisitions of land. Basil also decreed that all property acquired by the *dynatoi* (notables) from the poor since the time of Romanos I Lekapenos (920–44) should be returned without any compensation. The state claimed a right of eviction on all land that had been under state control as far back as the time of Augustus. Later he made the *dynatoi* responsible for the outstanding tax payments of the peasantry. Despite his efforts the *dynatoi* continued to be powerful and many noble families who figure prominently in later Byzantine history could trace their origins back to Basil's reign.

Basil spent a good part of his reign waging war against Bulgaria, which had become a serious threat again under the leadership of Samuel, who established his capital at Ohrid. At first, Basil was unsuccessful, being defeated by the Bulgarians at Trajan's Gates in 986. He returned in 991, but war with the Fatimids in Syria forced him to turn his attention elsewhere. In 1001, after concluding a peace treaty with the Fatimids, Basil returned again to Bulgaria. One of the most infamous incidents of this war followed his victory at Kleidion in 1014: he had thousands of Bulgarian prisoners of war blinded and then sent

Basil II: frontispiece of an 11th-century psalter showing Basil triumphant over the defeated Bulgarians, Biblioteca Marciana, Venice

them back to their king, Samuel, who purportedly died from the shock of seeing so horrific a sight. The war finally concluded with the capture of Ohrid in 1018. Basil's successful conquest of Bulgaria earned him the title "Bulgaroktonos" (Bulgar Slayer). He next extended Byzantine control over Croatia and Serbia. In the east he organized the kingdom of David of Tayk'/Tao into the theme of Iberia and in 1022 incorporated the kingdom of Vaspurakan into another theme. Basil also offered a marriage alliance to the German emperor Otto III between Otto and Basil's neice Zoe; however, Otto died before the marriage could take place. Basil's future military plans called for the reconquest of Sicily and war with the Western empire, but he did not live to carry out these projects. Because of his preoccupation with warfare, he treated scholars with disdain and consequently his reign witnessed a decline in intellectual and creative activity. Basil never married and died in Constantinople on 15 December 1025. He was succeeded by his brother Constantine VIII.

JOHN F. SHEAN

Biography

Born in 958, Basil succeeded John I Tzimiskes in 976, but until 985 power was exercised by Basil Lekapenos. Having defeated the rebellions of Bardas Phokas and Bardas Skleros, Basil curbed the rights of wealthy landowners. After several campaigns he conquered Bulgaria and earned the nickname "Bulgar Slayer". In the east he defeated the Georgians and planned the (unrealized) reconquest of Sicily. He died in 1025.

Basil the Great, St *c.*330–379

Christian writer

The "Cappadocian father" who made the greatest impact in his lifetime, Basil was the younger brother of St Macrina (the younger) and the elder brother of St Gregory of Nyssa. Growing up in a prosperous and cultured Christian family, he benefited from an extensive and extended education that left him with a knowledge not only of Christian writers but also of a range of Classical Greek philosophical and literary figures. Caesarea in his native Cappadocia saw the start of this education, and lengthy study followed in Constantinople and Athens. His university life in Athens was marked by the breadth and depth of his studies and by a somewhat austere regime of work and church attendance. Here he set himself mastery of pagan as well as Christian authors, sharing his enthusiasm with Gregory of Nazianzus, to become a lifelong friend, and also with Julian, later as emperor to abandon Christianity and with it Basil's friendship. Partly under the influence of the formidable and very talented Macrina, Basil abandoned a promising secular career in rhetoric, turning to monastic seclusion, briefly in Syria and Egypt, before settling to an eremitical life in Neocaesarea in 358. This was not a totally solitary existence, since he was joined by his friend Gregory with whom he undertook preaching expeditions in the surrounding countryside. This pattern was to be broken around 364 when the recognition of a basic talent brought him into active life in Caesarea. Its bishop, Eusebius, felt himself under extreme pressure from the emperor Valens who had taken up a marked Arian stance. Seeing in Basil a man who had not only maintained a firm Nicene orthodoxy but one who possessed outstanding powers of expression and determined character and, as it turned out, clear gifts of leadership, Eusebius summoned him to the defence of his Church against the stringent demands of the emperor. Working closely with his bishop, the newly ordained Basil rapidly made himself indispensable, gaining recognition as the natural successor to the see. Succeed Eusebius he did in 370, beginning a decade of administrative brilliance in a time of theological and ecclesiastical turmoil. The Arian ideas championed by Valens took on new forms in the teachings of Eunomius, while the divinity of the Holy Spirit was attacked by the Pneumatomachian party. Basil's opposition was vigorous in speech and writing. He did not live to see the Council of Constantinople (381), but his contributions to its definitive statements of orthodox belief are manifest.

It was not only unorthodox belief that occupied Basil. When it came to Church affairs he was no less capable of taking a strong line, even when it meant conflict with Rome and Alexandria over the appointment of the bishop of Antioch. Nor was he averse from exerting influence in political affairs. Having begun at the top with his confrontation with Valens, he would tackle provincial governors and imperial administrators on issues that he felt involved social justice or Church autonomy. His social concerns combined with his sense of ecclesiastical power, as he established a whole complex of social services, centred on buildings instituted as hospitals and refuges from poverty, setting up schemes for famine relief and poor relief programmes that would outlive him. A whole new Caesarea grew up, to the disapproval of some who wanted a more church-centred bishop, but strongly defended by others such as Nazianzen who saw here a vital expression of Christian concern, a proper complement to the vigorous sermons preached by Basil. The style might draw on the rhetorical practices of his youth in its telling use of standard figures, but it is saved from formalism by the liveliness of his insights and the pastoral concern evinced for his large and eager congregations. Whether he is expounding, against all comers, the Christian doctrine of creation, as in the *hexaemeron* sermons of 370, preached before he became bishop, or interpreting psalms or events in the liturgical year or again attempting to explain the nature of Christian duty and restraint, Basil emerges as a powerful expositor. He is equally effective in his numerous letters. When collected, they became recognized as literary models, yet content outweighs form, since the letters express deep feeling for friends, consolation for loss, commendation of perceived merit, alongside official correspondence dealing with behaviour in Church affairs and letters, sometimes of treatise length, setting out his understanding of the Nicene faith and its

legitimate development in terms of the Holy Spirit and the Trinity. His writing of sermons and letters was in competition for Basil's time not only with his episcopal administrative duties but also with the production of his strictly theological works. His lifelong adhesion to Nicene orthodoxy came out in 360 in his attack on the extreme Arian stance of Eunomius. The work by which he is probably best known is *On the Holy Spirit*, dedicated to his friend Amphilochius of Iconium.

The interest shown in correspondence with contemporaries who were not Christians is echoed in Basil's continued concern with Classical Greek literature. His awareness of his Christian past may be exemplified in the edition of selections of Origen's works that he produced in collaboration with Gregory of Nazianzus under the title *Philokalia*, yet he never lost interest in the writings of the Classical centuries, as he demonstrates in a treatise setting out educational principles on which young Christians may be encouraged to explore certain authors who predate Christianity. Written probably in his final years, this *Address* displays an understandable mixture of openness and caution. His young readers would be encouraged to range over poets from Homer to Euripides and to give thought to the works of Plato. Basil had seen Julian's attempt to place Christians on the cultural sidelines by banning them from teaching the Classics, a move he had passionately opposed. Yet he maintains a certain moral austerity, calling for concentration by his students on examples of excellence of character.

In the midst of this multifarious activity, Basil did not abandon another of his youthful enthusiasms, a yearning for the ascetic life. Amazingly, alongside a life of varied and apparently exhausting activity, he maintained a monastic vocation, having formulated in his early days alongside Nazianzen some 80 rules for right Christian conduct, the *Moralia*, applicable to all Christians prepared to follow ascetic practice within daily life, but especially focusing on the monastery. Later, Basil set out in detail in the *Asceticon*, the "Rule of St Basil", as it is widely known, a comprehensive understanding, in question and answer form, of the fundamentals of monastic life. Strict, without the vitiation of extremes, the Rules point to a life that was to become standard. Limited means, manual work, and study were to be set within a pattern of liturgical practice within a community life that enjoined obedience and chastity. This life, however, was not to be self-regarding. The bishop of social and educational concerns is visible in the monastic injunctions to relieve poverty and take part in training children. His emphasis on worship may also be traced in the "Liturgy of St Basil", partly attributable to him.

Any one of Basil's activities might have seemed sufficient to occupy a full life: their combination is astonishing. His influence continued in theological development, in educational practice through the Byzantine centuries into the Renaissance, and, perhaps most visibly, in the dominance of his Rule both in the East, where it remains central to this day, and in the West where, through the mediation of Rufinus, John Cassian, and most notably St Benedict, it had a profound effect. Basil is visible also in another sense, in that his stature as "the Great" was recognized in portraiture, where he is pictured as an elderly bishop, though he died around the age of 50, or with the attribute of a dove, interesting in a man whose career was far from totally eirenic. Representations of Basil occurred notably in Constantinople, on Mount Athos, in Sinai, and in Ochrid in Macedonia.

Biography

Born *c.*330 at Caesarea in Cappadocia, Basil was the brother of both St Gregory of Nyssa and St Macrina the Younger. Educated in Athens and Constantinople, he became the lifelong friend of St Gregory of Nazianzus. Abandoning rhetoric, he devoted himself to the ascetic life and in 370 became bishop of Caesarea. Surviving works include sermons, letters, a treatise *On the Holy Spirit*, an essay on pagan literature, and the *Asceticon* (his monastic rule). He died probably in 379.

Beirut

City in Phoenicia

Archaeological evidence of occupation on the site of Beirut goes back to Neolithic times. The earliest mention of the name occurs in the Amarna letters (1377–1360 BC). After Alexander the Great had conquered the Near East, the city was Hellenized under the rule of the Ptolemaic and Seleucid dynasties. The Roman emperor Augustus settled veterans on the site, and around 14 BC Beirut (Latin Berytus) received the status of a Roman colony. Henceforth it was an island of Latin culture in the Greek Near East.

Beirut owed not a few of the monumental buildings that marked it as a Graeco-Roman city to the patronage of king Herod of Judaea and his descendants. The religion of Beirut had a Graeco-Roman superstructure built on Semitic foundations. Poseidon/Neptune, the principal deity, was probably a Hellenized version of Baal Markod. The patron goddess of the city, Aphrodite/Venus, who was worshipped in a temple of Roman design, was probably Astarte in Graeco-Roman guise.

Beirut was a trading city known for its silk and purple dyeing. Around AD 238 the school of Roman law is mentioned for the first time. Gregory Thaumaturgus, later to be a famous missionary bishop, was a student. In the 4th century many young men who were hoping to make a career in the imperial service or the courts enrolled to study Roman law. At the time the sophist Libanius was worried that the competition of professional studies in Latin and law would replace the traditional rhetorical education based on the study of Greek literature. In the end his fear proved groundless. The latest known public inscription from Beirut written in Latin dates from AD 344. In the 5th century Greek became the language of instruction at the law school. From the prefecture of Cyrus (AD 439–42) praetorian prefects issued their edicts in Greek. In the 5th and early 6th centuries some very well-known jurists taught at Beirut, two of them members of the commission set up by Justinian to compile the *Corpus Iuris Civilis*. With the publication of the Code legal education was restricted to the schools in Constantinople, Rome, and Beirut.

By the 3rd century Christianity was well established at Beirut. Theodosius II gave it the status of an ecclesiastical metropolis, which it retained after the Council of Chalcedon (451), although by then it no longer had any suffragan sees subordinated to it. At this time Beirut, like much of Phoenicia, still had numerous practising pagans. Zacharias of Mytilene has left a vivid account of how sometime around 480 a group of Christian student activists organized a search for manuals of magic among fellow students, including at least one Christian, with a view to forcing their owners to surrender them. The books are said to have been works of Zoroaster, Ostanes, and Manetho, and their magic, though potentially capable of achieving a wide range of wicked purposes, appears to have been employed chiefly to further sexual relations and to find hidden treasure. It was claimed that a human sacrifice was being planned and that ownership of magical literature was much more widespread than had been suspected at first. Leadership of the campaign was taken over by the bishop. A popular rising in defence of the books and their owners was defeated with the help of a band of peasants brought in from the countryside. The books were burnt in the presence of the civil authorities. A pagan professor of law named Leontius was sent into exile until he converted to Christianity.

Beirut suffered a disastrous earthquake in 551 when 300,000 inhabitants are said to have been killed, though archaeological evidence suggests that not all the city was destroyed. According to the contemporary historian Agathias, the teaching of law resumed after the city had been rebuilt, but there are no later references to the law school. After the city was captured by the Arabs in 635, Muslims gradually formed the majority of the population, but the city contined to have Christian communities: Melkites, Monophysites, and, from the late 7th century, Maronites. Beirut was taken and held briefly by the emperor John I Tzimiskes in 975.

J.H.W.G. LIEBESCHUETZ

Summary

Beirut (Latin Berytus) was first Hellenized under the Ptolemaic and Seleucid dynasties. Augustus made it a Roman colony and it remained Latin-speaking until the 4th century. The city was famous for its school of Roman law, established *c.*AD 238 and still flourishing in the 6th century, and for its silk and purple dyeing. It fell to the Arabs in 635.

Berlin, Treaty of 1878

The Congress of Berlin, held in Berlin in June 1878, resulted in the treaty of Berlin. The congress and the treaty signalled Europe's readiness to involve itself more deeply in Balkan affairs. The terms of the treaty, while intended to impose a measure of stability on the peninsula, in fact set the stage for the violent conflicts that would devastate the area in the decades to come. For both these reasons, the treaty of Berlin has been called the single most important agreement for the Balkan nations of the 19th century. For Greece the consequences of the treaty were deeply negative. It was forced to accept a new state on its northern border, Bulgaria, that was directly competitive with it in Macedonia. Up to this time Greece had always assumed that it would be the beneficiary of any Ottoman retreat from the Balkans. After the treaty of Berlin this could no longer be taken for granted.

Although the decisions taken by the congress were of the utmost importance to the people of the Balkans, it was very much a meeting of the Great Powers and was intended to serve their interests. None of the Balkan states was allowed to participate fully in the proceedings, and they had to limit themselves to sending representatives who were permitted only to present their arguments. In no case were these arguments able to alter a major decision. The Great Powers – Britain, Russia, Austria-Hungary, and Germany – were concerned first and foremost to restore the European balance of power which had been upset by Russia's backing of a greater Bulgaria. The establishment of the new state of Bulgaria was a direct result of the troubled decade of the 1870s.

After 40 years of relative quiet the Balkans endured a protracted and peninsula-wide upheaval during the 1870s. Beginning with a peasant rebellion in Bosnia and Hercegovina in the summer of 1875 that refused to go away, the Great Powers – particularly Austria-Hungary and Russia – became increasingly concerned that the status quo could no longer be preserved. In the summer of 1876, as Serbian and Montenegrin forces began to invade Bosnia-Hercegovina, Russia and Austria-Hungary agreed to the following: if the Balkan armies were defeated, then Russia and Austria-Hungary would work together to maintain the status quo. Should they be victorious, then together, again, these two powers would partition the Ottoman empire but with the proviso that no great Balkan state should be established.

In the end Russia abandoned this rather hands-off approach. Spurred on by the disastrous performance of the Serbian military as well as the unwillingness of the Ottoman government to allow interference in the affairs of Bosnia-Hercegovina, in April 1877 Russia declared war on the Ottoman empire. Russian willingness to take on the Ottomans would give it extra leverage vis-à-vis the other great powers when the war was over, leverage that it would use to support its new client, Bulgaria. The Russo-Turkish war presented all the Balkan states, Greece among them, with an agonizing choice. Greece was well aware that Russia had plans for a Bulgarian state and it was afraid that, if it fought, the end result might be to wrest territory from the Ottomans only to give it to the Slavs. On the other hand, if it refrained from entering, it could well be left out of a peace settlement. By entering the war at the very last minute in February 1878, Greece got the worst of both worlds: it angered Britain, who had not wanted it to enter the conflict, but did not give any appreciable help to the Russians, who could thus disregard it.

Taking advantage of its victory over the Ottomans, Russia signed a bilateral treaty with the sultan in March 1878. The treaty of San Stefano, which established a new Bulgarian state, shocked European and Balkan powers alike. If the terms of the treaty had been carried out, Bulgaria would have embraced territory both north and south of the Balkan mountains, Thrace, and most of Macedonia. The state, now the largest in the Balkans, would clearly be under Russian control. For Greece this meant the end of its hopes to extend its boundaries to include Thrace and, especially, Macedonia. Not only that; the territory that Greece coveted was to be awarded to a detested Balkan enemy. For Austria-Hungary and Britain this was a completely unacceptable extension of Russia's influence in the Balkans without any corresponding gain for themselves. Austria-Hungary felt this particularly strongly. As far as it was concerned, Russia had violated their agreement, whereby if Russia extended its influence in the eastern Balkans, then Austria-Hungary had to be compensated with Bosnia-Hercegovina. Tremendous international pressure was brought to bear upon Russia and it eventually agreed to the meeting in Berlin, the express purpose of which was to rewrite the treaty of San Stefano.

If at least one Balkan power – Bulgaria – was satisfied by the terms of the treaty of San Stefano, none was made happy by the treaty of Berlin. Bulgaria was cut down to size, thereby ensuring a permanent sense of grievance on the part of the Bulgarians. The area south of the Balkan mountains was burdened with the tortured status of a semiautonomous province with a Christian governor chosen by an intricate process. This complex arrangement did not last, and in 1886 eastern Rumelia, as the area was known, was won for Bulgaria through force of arms. Unable to decide what should be done with them, the Great Powers handed Macedonia and Thrace back to the Ottoman empire. Every Balkan state interpreted this as a temporary arrangement and this ensured that, over the next 35 years, the area would become a bloodbath as Serbia, Greece, and Bulgaria sought to establish their claims over Macedonia in particular. Greece itself gained no territory at Berlin. Serbia was dismayed to see that its former ally, Russia, was concerned first and foremost to satisfy Austria-Hungary which, as a result of the treaty, received the right to occupy and administer Bosnia and Hercegovina. Thus Serbian ambitions in these areas, which were considerable, were blocked, just as Greece's were in Macedonia. This served only to increase Serbian interest in Macedonia.

By establishing a smaller Bulgarian state and awarding control in Bosnia-Hercegovina to Austria-Hungary, the Great Powers were able to re-establish amicable relations among themselves. But the treaty left every Balkan government feeling aggrieved and thus the arrangements made at Berlin increased, rather than decreased, the possibility of future conflict.

Bessarion *c.*1400–1472

Cardinal and scholar

Bessarion, a Byzantine monk and later cardinal of the Roman Church, was the most prominent of the Byzantine émigrés who took up residence in Italy during the 15th century. His background as a member of the Byzantine educated elite and his status as a powerful and wealthy cardinal of the Roman Church enabled him to assume a unique role both in preserving the Hellenic literary tradition of Byzantium and of the ancient world, and in disseminating that tradition throughout Italy and Western Europe. Above all he helped to stimulate the revival of the study of Plato during the Italian Renaissance.

In Constantinople in the early years of the 15th century Bessarion followed the traditional Byzantine higher education syllabus, studying under John Chortesmenos and George Chrysokokkes. He later spent time at Mistra with George Gemistos Plethon, the champion of Platonic studies, before being appointed metropolitan of Nicaea in 1437. The following year he accompanied the Byzantine emperor John VIII Palaiologos to the Council of Ferrara-Florence, where he emerged as one of the most prominent supporrers of union with the Roman Church among the Byzantine clergy. His *Dogmatic Discourse on the Union*, addressed to the Byzantine delegation, urged them to accept union with the Latin Church, the authority of the pope, and the "Western creed with its controversial addition of the word *filioque* ("and the son"), in the hope that military aid against the Turks would follow. When agreement was finally reached, Bessarion was accorded the honour of reading out the decretal of union in Greek in the cathedral of Florence on 6 July 1439. The union of the Churches, however, was not well received by the people of Constantinople, and from about 1442 Bessarion was living permanently in Rome. He was made a cardinal and was even considered for the papacy on two occasions.

Although many Byzantines saw Bessarion's conversion as treachery, he remained deeply concerned for his country and compatriots. He used his personal wealth and influence to assist his fellow Byzantines in exile, paying the ransoms of many of those taken prisoner after the fall of Constantinople in 1453. He also played an active role in the efforts to organize a crusade to retake the city. In 1471 he published his *Oration to the Leaders of Italy Regarding the Imminent Perils* in which he urged them to unite against the common enemy of all Christians.

Yet it was not only the military threat posed by the Turks to Italy that worried Bessarion, but the realization that their capture of Constantinople might finally extinguish the inheritance of Greek Classical literature that had been preserved for so long under the Byzantine empire. According to his own account, after 1453 he embarked on a systematic rescue mission, collecting manuscripts of the Greek Classics to preserve them for posterity. His servants were sent as far afield as Constantinople and Trebizond to purchase Greek manuscripts, and a small army of scribes was employed to make copies of these works, both in Italy and in the Venetian colony of Crete. Bessarion himself contributed to the process both by copying manuscripts and by scouring Italian monastic libraries in search of long-forgotten codices. He is alleged to have scored a notable success in the monastery of San Niccolò di Casole near Otranto, where he discovered the texts of works by Colluthus and Quintus Smyrnaeus.

Bessarion also promoted the translation of Greek texts into Latin, as a way of bringing them to a wider, non-Greek readership. He himself prepared Latin versions of Xenophon's *Memorabilia*, the metaphysical essay of Theophrastus, and Aristotle's *Metaphysics*, the last remaining the standard Latin translation until well into the 19th century. He also encouraged similar work by his protégés George of Trebizond and Theodore Gaza.

As a result of these activities, Bessarion expended the enormous sum of 30,000 florins and built up a vast collection of some 800 books. In 1468, having decided that the Venetian republic was the most stable of the Italian states and so most likely to be able to preserve the Hellenic inheritance, he donated the entire collection to the church of St Mark in Venice, where it is still preserved in the Marciana Library. It included some of the most important manuscripts of Classical literature, such as the famous Codex Venetus of Aristophanes (Marc. gr. 474). They were a major reason why, in the 1490s, the publisher Aldus Manutius chose Venice as the site for his Greek printing press, which before 1515 produced editions of nearly all the works of the major Greek authors of antiquity.

Apart from the collection, reproduction, and translation of manuscripts of Classical Greek texts, Bessarion also played an important role in promoting discussion and debate as to their value and meaning. His residence next to the church of the Holy Apostles in Rome became a meeting place for scholars, an "Academy" where prominent Italian humanists such as Flavio Biondo, Lorenzo Valla, and Poggio Bracciolini could discuss Hellenic philosophy and literature with the many Greek expatriates, including George of Trebizond, Theodore Gaza, and Andronikos Kallistos, who lived under Bessarion's protection.

Bessarion and his circle were at the centre of the debate on the merits of the works of Plato, which were only now once more becoming available in the West. While the philosophy of

Bessarion: 16th-century engraving of Bessarion in his cardinal's hat

Aristotle had long ago come to be regarded as compatible with Christian doctrine, aspects of Plato's thought, such as the concept of metempsychosis, or the transmigration of souls, were much more difficult to reconcile with traditional theology. The debate had begun in 1438 when Bessarion's teacher, George Gemistos Plethon, had circulated his treatise *On the Differences of Plato and Aristotle* at the Council of Florence, and the whole question had become much more heated when George of Trebizond had published his *Comparisons of Plato and Aristotle*, a strongly worded attack on both Plato and Plethon. In 1469 Bessarion produced his *Against the Calumniator of Plato*, in both Latin and Greek, as a reply to the attacks of George of Trebizond. Bessarion sought to defend Plato by stressing those areas of his thought that were reconcilable with Christianity, and by relegating the "celestial republic", with its communal sharing of property and wives, to the status of an ideal, unattainable in a fallen world. His championship of Plato proved to be much more successful than Plethon's had been: by expounding Plato's thought in Latin, *Against the Calumniator* made it accessible to a much wider readership, and by stressing the points of agreement both with Aristotle and with Christian doctrine, it helped to make its study respectable.

JONATHAN HARRIS

Biography

Born around 1400 at Trebizond, Bessarion was educated in Constantinople and Mistra. He became a monk in 1423 and was appointed Metropolitan of Nicaea in 1437. In 1438 he attended the Council of Florence as a leader of the unionists. In 1439 he converted to Roman Catholicism and became a cardinal. He devoted himself to rescuing manuscripts of Greek Classical literature and bringing them to Italy. On his death in 1472 he left his library of some 800 books to Venice.

Biography and Autobiography

The genre of biography, if it can indeed be called a genre before the advent of the saint's *Life*, was one of extreme fluidity, some examples being categorized in antiquity rather under other genres such as the encomium and the funeral speech. The format too varied greatly: Satyrus' *Life of Euripides*, for instance, a work of the 3rd century BC, was even written as a dialogue. The term "biography" itself does not appear before the 5th century AD (in fragments of Damascius' *Life of Isidorus*), although *bios* (life) occurs for some varieties of biography from the 4th century BC, when it was even used collectively for Dicaearchus' cultural *Life of Greece*. The word "autobiography" is not ancient at all, but appears to have been coined by an anonymous English reviewer in 1797, and rejected by its author as pedantic.

The germ of biography is evident in the earliest Greek literature. In each of the Homeric epics an interest in the doings of individuals is signalled in the opening line. The *Iliad* deals centrally with the wrath of Achilles in his quarrel with Agamemnon and adds excursus on the prowess of a host of other noble warriors in preference to detailing the progress of a campaign; the *Odyssey* focuses on the adventures over a ten-

year period of its eponymous hero. Personal revelations are made by Hesiod in his *Works and Days* and also, although there is much modern scholarly argument over their veracity, by the lyric poets of the Archaic age. An interest in genealogy too is attested towards the end of this period.

True biography and autobiography, however, began only in the 5th and 4th centuries BC. According to Momigliano, the first occurred largely in Greek Asia Minor, and he plausibly attributes it to eastern influence, and the second in mariners' accounts of their voyages, but the scanty evidence precludes any certainty in either case. From the beginning, however, as far as can be perceived, and throughout the history of surviving Classical and Byzantine biographical writing, one feature was consistently maintained: in the case especially of political and military figures, to a far greater extent than in the modern world, a distinction was drawn between histories containing biographical information and works centred upon an individual. The former generally restrict themselves to adult activities, detail the individual's publicly important actions, and strive for a high standard of truth; the latter include information on childhood, emphasize the personality, and often twist the strict truth for the sake of the work's overall purpose (the loci classici are Polybius, 10. 24 and Plutarch, *Life of Alexander*, 1. 2).

Commonly cited as the earliest of all Greek biographies, and dating from the first third of the 5th century BC, is *Matters Concerning Heraclides, King of Mylasa* by Scylax of Caryanda. However, only the title is preserved (and that only in a Byzantine compilation of the 10th century AD), there is no indication whatsoever of the nature of the work, and its attribution to this rather than the later Scylax of Halicarnassus or even to a third Scylax is open to question. Quotations direct and indirect from *On Themistocles, Thucydides and Pericles* by Stesimbrotus of Thasos (*c.*470–425 BC) clearly indicate a decided bibliographic interest, but even here the exact nature of the work is unclear. Possibly groundbreaking is the roughly contemporary prose *Epidemiai* by the poet Ion of Chios in which he describes, with obvious autobiographical elements, his visits to and impressions of notable men both political and literary (e.g. the tragedians Aeschylus and Sophocles), while fragments indicate that he mentioned philosophers too, including Socrates (without proving in this case any personal acquaintance).

In the earliest surviving Greek history Herodotus shows overt biographical interest in eastern rulers, whereas his Greeks generally appear as individuals more covertly through their actions, the latter a tendency even more pronounced in Thucydides. This may simply be explicable on the ground of familiarity to their audiences, but may reflect oriental practice in monarchies in contrast to the more communal emphasis in the Greek city states. The oldest surviving Greek works actually centred upon an individual date from the first half of the 4th century BC and take notably different forms. First there are "apologies" (legal defences), especially of Socrates, for whom both Plato and Xenophon initiated a series of ever more imaginary material which continued until the sophist Libanius' declamation in the 4th century AD. Plato's became increasingly regarded as the standard biography of the historical Socrates, while Xenophon supplemented his with a collection of reminiscences (*Memorabilia*) of the philosopher's conversations, most, if not all, garnered from other sources. In imitation Isocrates, in 353 BC at the age of 82, after an unsuccessful law suit, felt compelled to write an imaginary forensic defence of his own life's work (*Antidosis*). Demosthenes' *De Corona*, on the other hand, is a real and spirited defence of the author's political career delivered personally in court in 330 BC but dealing with the period before Athens' submission to Macedon. Fully fledged encomia too appeared in the first half of the 5th century BC. Isocrates asserts in his *Evagoras* (king of Salamis in Cyprus who was assassinated in 374 BC) that he is the first to "praise a man's virtues in prose", presumably meaning in an extended single work. The dramatic, though fictional, setting is a funeral oration, which in a democracy was usually reserved for citizens collectively lost in battle. His uncritical laudatory example was followed by Xenophon, whose *Agesilaus* similarly describes its subject's actions and virtues, but may have been inspired by adverse criticism of the Spartan king (died 359 BC). Two further works of Xenophon demonstrate the extended range of biographical writing. The *Anabasis* vigorously and memorably describes his own role in leading home from Mesopotamia the Greek mercenaries after the battle of Cunaxa in 401 BC. The *Cyropaedia* is extraordinarily difficult to classify, since it deals only briefly with its ostensible subject (the education of Cyrus the Great), and is closer to a very lengthy dissertation on ideal kingship. It has been described as both a philosophical novel and the precursor of the love-romance. Moreover, whereas in the *Anabasis* historical veracity is occasionally subordinated to a self-advertisement necessitated by (lost) rival accounts, the *Cyropaedia* is so cavalier with truth as, among numerous flagrantly fictitious assertions, to have its hero die in bed rather than battle.

Aristotle encouraged a continuing Peripatetic biographical interest in other directions. The only surviving work is Theophrastus' *Characters*, a series of 30 sketches of unpleasant types of personality. His contemporary Clearchus of Soli attempted descriptions of different peoples. Others, not all Peripatetics, wrote on real individual figures (Theophrastus himself on Aristotle's nephew Callisthenes of Olynthus, a historian of Alexander the Great executed by the king) and especially philosophers. Aristoxenus' *Lives* were anecdotal and waspish; Antigonus of Carystus raised the subject to a higher level of scholarly accuracy in the mid-3rd century BC; and in the early 2nd century BC Sotion tried in his 13-book *Succession of the Philosophers* to establish an intellectual lineage from teacher to student, a serial form of philosophical biography best known today in Diogenes Laertius' work of the 3rd (?) century AD. Poets were not forgotten, and with older figures (beginning with Homer) ignorance was often not permitted to vitiate a full account: Chamaeleon, for instance, in the late 4th or early 3rd century BC, inferred biographical facts from the writers' own compositions, a practice that could lead to ludicrous inaccuracies and (a far more serious problem) to numerous suspect assertions not demonstrably false. Through a love of sensationalism, in the 3rd century BC Hermippus of Smyrna was deliberately fraudulent in his biographies of philosophers, poets, and lawgivers, of whom some were mythical.

Political biography from the Hellenistic period has also perished. Nevertheless, scattered fragments and allusions point to an increasing interest in individual rulers which was inspired by the charismatic career of Alexander the Great and continued under the numerous subsequent monarchies. Some of these

works naturally veered towards panegyric, such as *How Alexander was Brought Up* by the king's helmsman Onesicritus, who probably modelled his work on Xenophon's *Cyropaedia*. Adversely critical moral judgements, however, are suggested by monographs on types of public figures such as the Peripatetic Phaenias' *On the Tyrants of Sicily* and *The Slaying of Tyrants for Revenge*, Idomeneus' *On* [Athenian] *Demagogues* and Hermippus' *Lives of Those who Passed from Philosophy to Tyranny and Despotic Rule*. Nepos' surviving Latin biographies (including some of Greeks) from the 1st century AD, which have both an encomiastic and an ethical purpose, probably reflect a trend in most lost Hellenistic productions. Apologetic memoirs too by public figures continued, including the influential work of Aratus, the Sicyonian statesman of the 3rd century BC.

It is only from the imperial Roman age that true Greek biography and autobiography survive in substantial quantity, and even then not until the 1st and 2nd centuries AD. A largely new aspect of autobiographical works is their composition by intellectuals. Unfortunately only fragments remain of *On My Own Life and Education* by Nicolaus of Damascus, a Peripatetic aristocrat, tutor of the children of Mark Antony and adviser to Herod the Great (who wrote also a now fragmentary biography of Augustus which was based upon the emperor's own autobiography), but the Hellenized aristocratic Jewish priest Josephus saw fit to include intellectual matters in his surviving *Life*, which is chiefly intended as a defence of his command of Galilee during the first Jewish revolt (AD 66–70). The *To Himself* (*Meditations*) of the Roman emperor Marcus Aurelius, a unique work from antiquity consisting of very private self-exploratory musings on human existence whose subsequent publication is a complete mystery, also reflects (although it may not be categorized as a true autobiography) this trend, as does more clearly the physician Galen's philosophical *On My Own Opinions*. Notable later examples are the autobiography of the Antiochene rhetorician Libanius, written over nearly 20 years and in the form of a sophistic discourse, and most especially Synesius of Cyrene's *Dion*, in which he defends his attachment to Classical culture against both monkish asceticism and excessive pagan superstition.

Biographies of public figures reached their acme with Plutarch, whose *Parallel Lives* (in which he paired Greeks and Romans with usually a concluding comparison) was already an educational text by the early Byzantine period. Unlike many Greek biographies, they are of genuine literary merit and, despite some problems, real historical value; and they deal with the entire lives of their subject. Nevertheless, their primary aim was moral education through examples of virtuous and vicious behaviour. Their psychological observations are on occasion subtly perceptive. Historical monographs (rather than true biographies), centred upon an individual and usually verging on the encomium, also continued to be written, such as Arrian's *Anabasis of Alexander* and the somewhat earlier second book of Maccabees (an epitome of a lost work by a certain Jason of Cyrene).

Biographies of philosophers are still to be found in the imperial age, but, in reflection of current literary interests, sophists replace poets. Modern knowledge of the Second Sophistic is largely dependent upon the 3rd-century *Lives of the Sophists* by Lucius Flavius Philostratus ("the Athenian"), a collection of brief and at times tendentious sketches. Diogenes Laertius' compendium of the lives and tenets of ancient philosophers, derived from similar earlier compilations, is a work of industry but little critical acumen and is chiefly valuable today for its quotation of three compositions by Epicurus. Generally more scholarly, though laudatory, biographies are those of the Neoplatonists Plotinus and Proclus by their pupils Porphyry and Marinus respectively, while biographies of Pythagoras by Porphyry and Iamblichus claim him as the source of Plato's philosophy.

In the imperial (and Byzantine) age, far more than before, contemporary rulers were subject to epideictic oratory, which contained many biographical details, albeit highly encomiastic and selective. The late 3rd-century rhetorician Menander, in laying down their formulaic contents, shows the types into which these addresses were divided: they included the encomiastic imperial oration and the address to local governors, speeches of welcome and valediction, speeches at weddings, birthdays, and funerals, the ambassador's speech, and many more. Most surviving examples are Byzantine, the emperor expecting one every year at Epiphany, and the ecumenical patriarch on Lazarus Saturday.

Biography of the Hellenistic and imperial ages had similarities with and probably influence on the anecdotal style of the synoptic gospels, a feature that persisted into the Lives of martyrs and saints. It is unclear to what extent the rise of Christianity or simply the common culture of late antiquity may have prompted the empress Julia Domna (d. 217) to bid Philostratus write a biography of the neo-Pythagorean holy man Apollonius of Tyana, a fictionalized amalgam of exotic travel, miracles, exorcisms, sage advice, religious asceticism, and nonconformity unique in pagan biography. At least it elicited a comparison between Apollonius and Jesus, which in turn provoked a refutation by Eusebius in the early 4th century. Lives of Christian saints most probably induced Eunapius to follow Philostratus in producing similar, though inferior and idealized, sketches of 4th-century pagan philosophers, rhetoricians, and iatrosophists.

By far the most important form of biography in the Byzantine period is hagiography (see the separate entry under that title), an edifying and often exciting recital of an individual's struggle for union with God. Saints themselves, though frequently vouchsafing much personal information in their letters and other writings, rarely wrote overt autobiographies. That by Gregory of Nazianzus is made doubly remarkable by his preference for verse over prose. In the 11th century St Christodoulos of Patmos attached an autobiography to the Typikon (charter) of his monastery, a practice followed also by the historian Michael Attaleiates and later by Michael VIII Palaiologos (1259–82).

Byzantine historians were often eyewitnesses of or participants in what they describe, and Michael Psellos in his 11th-century *Chronographia* was especially and notoriously unable to forget the importance of his own involvement. Nevertheless, although Nikephoros Basilakes discusses his education and teaching in an introduction to a collection of his works which he made around 1160, true autobiography does not reappear until the Palaiologan period, when it appealed to a variety of men. The most interesting examples are those of the teacher and scholar Nikephoros Blemmydes (an apologia of his life),

the cultured Constantinopolitan patriarch Gregory II, the scholarly statesman Theodore Metochites, and the philo-Latin Roman convert to Roman Catholicism Demetrios Kydones. Perhaps classifiable also as autobiography are the *Histories* of the usurping emperor John VI Kantakouzenos, written after he became a monk in 1354, who with the sedulously fostered guise of objectivity sought to defend his political career.

Byzantine secular biographies are even less common, although a few imperial figures such as Theodora the wife of Theophilos (829–42), and John III Vatatzes (1221–54) received them in hagiographic form. They are nearly all encomiastic, more critical appraisals being reserved for histories (although hagiography could take the form of hostile biography as in Niketas David Paphlagon's *Life* of Ignatios, which becomes an attack on the rival patriarch Photios). The biography of Basil I, written or at least commissioned by Constantine VII Porphyrogennetos (913–59), is indeed embedded within a history (the so-called *Theophanes Continuatus*) and was designed to validate the position of Constantine. The *Alexiad* stands on its own and is a far more ambitious defence of her father by the princess Anna Komnene, while the five-book history by Michael Kritoboulos of Imbros is to a considerable extent a eulogy of the conqueror of Constantinople, Mehmet II Fatih, to whom it is dedicated. In complete contrast, except that they too seemingly veer from the strict truth, are a few biographical invectives. Noteworthy in this connection are two from the 12th century. The anonymous *Anacharsis or Ananias* belabours an aristocratic failure at soldiering, riding, hunting, musicianship, calligraphy, and astrology, whose second marriage was to a Jewess whom even baptism could not save from being called a frog. Nikephoros Basilakes' target is a certain Bagoas, an educated catamite of humble birth who feigned piety to insinuate himself into the palace.

During the period of foreign occupation after the fall of Constantinople in 1453 various eyewitness accounts of specific calamitous events contain personal details. Autobiographical writing proper was rare and usually restricted to descriptions of journeys or captivity, such as that of "Christopher Angell [Angelos], a Grecian, who tasted of many stripes and torments inflicted by the Turkes for the faith which he had in Christ Iesus", as the English version proclaims. He used Classical Greek for his work, published in 1617 at Oxford where he taught his native language, whereas his near contemporary Georgios Mosketes, professor of Greek at Pisa, chose Italian for an account of his travels in the Levant, imprisonment by the Turks, and subsequent ransom. Memoirs became more common in the second half of the 18th century (including some by the Constantinopolitan patriarch Meletios II in the high language) and reached their climax during the War of Independence, most notably in the vivid and idiosyncratic vernacular reminiscences of General Makriyannis.

Biographies before the late 18th century are rare and at first rather chronicles of a series of rulers or patriarchs. However, the increasing involvement of Russia in Greek affairs encouraged in 1736 a lengthy *Life of Peter the Great* in Italian by Antonios Katephoros, which was later translated into vernacular Greek. Growing patriotism in anticipation of escape from Turkish rule spawned biographies of ancient heroes: an adaptation of the pseudo-Callisthenic *Alexander Romance* (1800) is attributed to Demetrios Gobdelas, professor and rector of the Greek school at Jassy, while Athanasios of Stagira used western sources for his *Lives* of Themistocles (1816) and Miltiades (1818); and whereas a certain Spyridon Kaphireus wrote on the *Virtues and Deeds of Demosthenes* (1820), the Athenian patriot in the struggle against the Macedonians, Georgios Bentotes, was inspired by Marmontel's *Bélisaire* to translate that imaginative reconstruction of the romantic Byzantine general's latter days (1783). Far more useful, however, is *The New Greece* (published posthumously in 1872) by Georgios Zabiras (1744–1804), which presents biographies of 517 Greek savants of the Tourkokratia. An interest in personality types reappeared too during this period, inspired by Theophrastus' *Characters*: Adamantios Korais edited this work and translated it into French (1799), Demetrios Darbaris produced a Greek translation with a few additional characters of his own (1795), and Charisios Megdanes composed imitations under the title *Lychnos tou Diogenous* [Lantern of Diogenes] (1818).

Later 19th- and 20th-century Greek biography and autobiography largely followed, generally without any great distinction, the styles of other European literatures. Three works, however, stand out. In his *To Taxidi Mou* [My Journey] of 1888 Ioannis Psycharis chose semi-fictional autobiographical travels around the Greek world to make his clamant demand for official recognition of the demotic language; Ilias Venezis's *Noumero 31328* [Number 31328] is a graphic description of his time as a prisoner of the Turks (1922–23); Nikos Kazantzakis's last, and posthumously published, work, *Anaphora ston Greko* [Report to Greco] (1957), is a highly fictionalized autobiography in which he seeks to give a spiritual and philosophical coherence to his journey through life.

Birth

Birth is a crucial feature of the life cycle. In the Greek cultural milieu, childbearing and family continuity are of paramount importance, with marriage and children considered to be life's highest attainment. The procreative purpose of female sexuality is emphasized, the role of the mother is glorified, and there is an apparent tendency to chide those who are either unable to achieve such a state within marriage or in some way rebel against it. The birth of a child is seen as ensuring the regeneration of life within the family and the community. It is regarded as a way of defeating death and securing personal immortality, since Greek children often bear their grandparents' names. In antiquity the Greeks were also dependent on their offspring for the perpetuity of their families (*oikoi*), for support in old age, and for the tending of their tombs after death.

Until recently birth was primarily the concern of women. Its social history points to similarities in the experience and status of Greek women in all historical periods. The principal role of all Greek women was that of bearers and nurturers of legitimate children and, indeed, continuance of the race. Although we cannot speak of Greek women in antiquity as a unified group, legal and historical sources attest to the exclusion of women throughout Greece from the public domain, and to their devotion solely to reproduction. Indeed, even Spartan women – who were considered to be different and more visible than other Greek women in the public sphere because of their involvement in many athletic events – engaged in such activities with the main goal of bracing their bodies for delivering children for the city. Thus infertility in antiquity was viewed as a calamity; conversely, the birth of a child brought about a great change in the bride's position through full admission into the conjugal family, denied to her up to then.

Conception and childbirth were also seen as beneficial for female health and were prescribed as cures for a number of gynaecological conditions. Labour and delivery, however, could he difficult and in some cases could even lead to death. A high rate of both maternal and infant mortality is often assumed by researchers who report on the use of various herbal drinks, induced sneezing, or the tying of a pumice or a dead cyclamen root on a woman's thigh as a means of easing a difficult delivery. There was also a belief that delivery would be impeded if things were tied on or around the mother, for example, her hair or a belt. Because of the dangers involved in childbirth, women often invoked the help of certain deities who were believed to protect them on delivery, such as Artemis (Lochia), Athena, Eileithyia, and Genetyllis (in Attica).

Women gave birth at home with the assistance of female relatives and neighbours and/or a midwife. Male doctors were expected to assist only in cases of prolonged and hazardous labour. The role of the midwife was notable both in antiquity and in the recent past, and in some cases she shared the same status as a doctor. At birth it was the midwife who announced the sex of the child, cut and tied the umbilical cord, and judged its fitness to live. Yet, the expertise of the midwife was not limited to the process of delivery and to the birth itself. She was able to treat many female complaints that had to do with the uterus as well as postnatal problems, such as puerperal fever. In fact, a competent midwife possessed a wide knowledge of such diverse fields as dietetics, pharmacology, surgery (meaning the "work of hands"), and magic.

The use of a wet-nurse or dry-nurse was also common in Greek antiquity, but the mother was regarded as the infant's prime caretaker. However, children belonged to their fathers, not to their mothers, and Greek law codes asserted that in the event of the father's death the newborn should be offered to its father's family. Male infants were favoured and the male foetus was believed to be more active than the female. Women who carried a male child were thought to be healthier with a better complexion, as well as having an easier pregnancy and delivery. Many ethnographic data refer to the use of figurines to increase fertility. Women who desired to have a child made an effigy of themselves as pregnant or an effigy of their prospective child as an adult and carried it as a talisman. Some researchers believe that the large number of female idols found in the Aegean and dating from the early Neolithic period may reveal an earlier preference for the birth of girls, since fertility was crucial for the survival of the group and pregnancy as well as maternity may even have granted special symbolic value to women. However, data on infanticide and the exposure of infants in Hellenistic Greece reveal that, if such a preference existed in early antiquity, it must have ceased later on because girls formed the group that was most highly at risk from such practices. Both infanticide and abortion were regarded as acceptable forms of family planning, with the former being preferable to the latter from the point of view of the mother's health.

Childbirth was considered unclean both in antiquity and in the present day, because it is coloured by natural, profane blood and thus ritually pollutes all those concerned, especially the mother. In antiquity the mother was considered impure until her postnatal bleeding had stopped. For that period of time contact with the sacred was avoided and women were excluded from the temples. A 40-day purification period was also followed by women after an abortion.

During the Byzantine era birth was institutionalized with the establishment of some lying-in hospitals, but the majority of women continued to give birth at home with the help of a midwife. Although evidence is lacking concerning the size of families and the frequency of births in this period, there was still a high rate of maternal and infant mortality. In this regard, A. Laiou estimates the net birth rate in the 14th century as 22

per 1000. Christianity, however, changed attitudes towards marriage and procreation, which were now viewed as subordinate to celibacy. At the same time the prestige of the woman as wife and mother grew due to her association with the greatest archetype of Christian cosmology, the Mother of God. The birth of boys was still favoured over that of girls since girls had to be endowed with dowries, and infertility was still a source of tremendous shame. In Byzantium many pre-Christian beliefs concerning childbearing persisted despite their condemnation by the Church. In the absence of medical expertise midwives often employed a mixture of medical folklore practices and outright witchcraft to facilitate birth. Midwives were thus often associated with heretical beliefs and rituals. Women used various religious objects in order to gain divine assistance during delivery. The use of pagan amulets was also widespread, and was responsible for women commonly being accused of superstitious practices.

Christian writers condemned contraception and abortion, at any stage of pregnancy, as even worse than murder since they claimed that the victim lost the chance to become a human being. Nevertheless, Byzantine women used several means to prevent continuous pregnancies, the most common being toxic herbal medicines and long periods of breast-feeding, which reduced the risk of pregnancy, as well as postnatal taboos on sexual intercourse. Sexual intercourse was also prohibited on Sundays and fasting days, and there was a belief that women who conceived on such days would give birth to lepers and epileptics. In the absence of effective contraception the only option that remained open to parents, especially those living in extreme poverty, was the abandonment of infants. Many children were abandoned at the entrance of churches or wealthy households, and the Christian emperors could do little in such cases. Constantine I, in a law of 329, permitted the sale of children in cases of extreme poverty. The creation of orphanages represented an attempt by the Church and the state to relieve such problems.

Under Ottoman rule the desire of Greeks for male children became more palpable than ever, for boys were equated with weapons and thus increased the hope of liberation. Birth continued to take place at home, as in earlier periods. It is worth noting, however, that during the Tourkokratia the custom of breastfeeding became established throughout Greece, since it was closely related to the survival of infants, and thus of the Greek people in general. Greek mothers considered breastfeeding to be the "eighth sacrament" of the Church, thus making it a sacred act. Moreover, evidence shows that the socialization of girls into motherhood and breastfeeding practices started at 3 years of age when the child was given her first doll. Maternal mortality during this period was more than 35 per cent – 20 times greater than it is today – and the wet nurses (*vizastres*) were therefore honoured by the people and the Church. They were the first to receive the consecrated host (*antidoron*) from the priest in church, and those who had nursed many children were automatically granted absolution. The patron saint of wet nurses was St Marina, and the woman who nursed nine children was called "St Marina and Mistress". The importance attached to breastfeeding is also attested by the fact that children who were nursed by the same woman were considered to be siblings, and were therefore forbidden to marry one another.

In the rural areas of modern Greece such practices continued – and still continue in some areas even today with minor variations. The wealth of folk traditions and rituals regarding pregnancy, childbirth, the first weeks of life of the infant, and the transitional period faced by the mother persisted in modern Greece until the 1960s, and some persist today. In some cases, the incorporation of ancient traditions and rituals into Orthodox Christianity is obvious. Today the saints who are most often invoked by pregnant women are St Elevtherios – his name derives from the word *elevtheria* (freedom) and he helps women in delivery – and St Marina. It is notable that in Athens the churches devoted to these particular saints are built on the ruins of temples of Eileithyia, the deity who was connected with labour and delivery in antiquity.

It is not necessary to delve very far into the past to find the belief that during pregnancy and the postnatal period women were considered open to demonic attack and were protected by certain prohibitions, such as the 40-day taboo, the avoidance of crossing over ravines, the constant censing of the house, and the fear of darkness. The infant, too, was considered to be particularly susceptible to the "evil eye", and for 40 days was kept inside the house. The end of that period was, and still is, marked by an act of purification where mother and child receive the blessing of the priest at church (*sarantisma*). There is also a widespread belief that on the first, third, or seventh day after birth – depending on the area – the infant is visited by the Fates (Moires), known also as "old women" (*gries*), which predetermines his or her luck and the events of the whole of his or her life. Special measures had to be taken for the reception of the Fates. The dogs of the house had to be tied up, so as not to scare the Fates into leaving; the furniture of the house was moved so as not to obstruct their way; and a table with honey, bread, wine, and sweets had to be laid out. The mother, however, was not left alone because the Fates were old and envious and might harm her. Other customs that have endured include the use of certain herbs to induce fertility, and formulas followed during the rite of marriage, conception, pregnancy, and childbirth to increase the chance of the birth of male infants (*arrenogonia*). Finally, the belief that pregnant women crave certain foods is very much alive, as is the belief that, if they do not eat them, they will either lose the baby or their baby will have a birthmark.

Up to the 1960s the midwife was an important figure in village communities, and in some areas of northern Greece is still honoured on 8 January, on what is known as the "day of the midwife". From the 1950s, however, childbirth has been increasingly institutionalized and the magico-religious practices surrounding it have gradually disappeared. Women now give birth in hospitals or private clinics under the care of obstetricians who are mostly males. Breastfeeding is no longer widespread, and since maternal and infant mortality is greatly reduced, couples have fewer children than in the past. Indeed, the recent decline in the birth rate is one of the greatest problems of Greece. Between 1975 and 1995 the birthrate decreased to about 40 to 60 per cent; the average number of children in 1995 was estimated to be between 1.25 and 1.49. Infertility, however, is still regarded as a social and personal defect, for which women are held responsible, though increasingly medical science persuades men to bear responsibility as well.

Compared to other life-cycle rituals, such as marriage and death, birth was and still is less publicly ritualized. Moreover, in all historical periods the father does not really figure in the process, because in Greece a second, superior "social" birth exists that usually negates the part played by women and transfers control to men. In antiquity children were incorporated into society in a celebration held five or ten days after their birth (*amphidromia*) in which they were given a name and were publicly acknowledged as family members. In the context of Greek Orthodoxy children receive a second, superior birth with baptism and become full members of the Christian community; it is during baptism that they receive their name and hence become persons. Finally, one of the ways in which infertility was confronted, both in antiquity and at present, was through adoption. In certain areas of modern Greece, the father would pass the adopted child through a wide sleeve that was stitched on to his shirt, in a symbolic act of birth known as *arrenolocheia* (couvade).

Bishops

The Greek word *episkopos*, the Latinized form of which (*episcopus*) is the root of the word "bishop", literally means "overseer". In the Christian Church it has come to denote the highest ministry, after those of deacon and priest.

In Classical antiquity and in the apostolic age the noun referred to a function or an activity, namely that of being a supervisor. In ancient Greece *episkopoi* are attested as supervisors and business managers in both a secular and a religious context, as state or city officials or as officers of pagan cults. There are only six passages in the New Testament – none of them in the gospels – that use the word and its cognates to refer either to Christ as the shepherd and guardian of souls (1 Peter 2: 25) or to those who occupy a supervisory role within the communities (Acts 1: 20; Acts 20: 28; Philippians 1: 1; 1 Timothy 3: 1–7; Titus 1: 7–9). It is significant that these passages allow for the possibility of several *episkopoi* within a congregation and that they do not specify the need for every congregation to appoint *episkopoi*. In fact, before the 4th century, Christian writers often fail to make a clear distinction between the episcopate and the presbyterate.

Paul's First Letter to Timothy (1 Timothy 3: 2–7) provides the earliest description of the ideal character of an *episkopos*, inspiring all later writing on the subject. He has to be well respected, irreproachable in his lifestyle, of sound character, not a recent convert, and a gifted teacher. He also has to be an able manager of his own household – thus proving his poten-

tial to hold authority in the congregation – and may not be married more than once.

The monarchic episcopate, where there is only one bishop for a community, is first attested in the epistles of Ignatius of Antioch (died *c.*107). The word *episkopos* now acquired the additional sense of a specific office in the Christian Church. Ignatius regards the monarchic episcopate simultaneously as a reflection of the One God and as a guarantor for the doctrinal unity of the Church. The bishop represents God while the presbyters represent the Apostles. At the same time he is the first among equals within the presbyterate. To his congregation he is the spiritual model due to his exemplary conduct and the sacral centre due to his liturgical functions.

By the 4th century the episcopal office had acquired clearer contours, and traditions regarding episcopal appointment had been established that would remain valid, with certain variations, to the present day. A minimum age of 30 years is required for ordination to the priesthood in the Orthodox Church, and by extension also for the episcopate. The bishop's character must be above reproach. He may not be a neophyte and he must have the higher education essential to his duty as a teacher. The celibacy of bishops that has become customary today was demanded in the legislation of the emperor Justinian (527–65), but it was not consistently enforced. Still in 692 the Council in Trullo (Quinisext Council) stipulated that, if a bishop-elect was married, his wife had to enter a monastery at some distance from his residence. Eventually, the problem was eliminated by recruiting bishops from monasteries. Another concern was simony, i.e. the purchase of ecclesiastical office. Contested episcopal elections between ambitious candidates could easily turn into riots and lead to bloodshed, as John Chrysostom reports for the city of Antioch. Church councils repeatedly inveigh against this practice, which undermined the honour of the episcopal office.

The concrete circumstances of the election of a bishop vary over time and in different regions. The general guidelines were set down by the Council of Nicaea (325) which repeats in essence the *Apostolic Tradition* of Hippolytus of Rome: a new bishop must be elected by the inhabitants and the clergy of the city where his see is located, as well as by all the other bishops in the relevant diocese, either at a synod or by letter. Once the candidate is confirmed by the metropolitan, his ordination is performed by three, or at least two, bishops from neighbouring sees through the laying on of hands, in a demonstration of the principle of collegiality. A bishop may not leave his diocese for prolonged periods of time, nor may he seek a lateral transfer to another episcopal see.

In the early Church only the bishops were allowed to preach and to perform baptisms, but these functions were eventually extended to priests. However, the ordination of priests and deacons as well as the consecration of church altars remains the exclusive domain of bishops to the present day. The bishop is assisted by one or more deacons in his liturgical functions, and by an *oikonomos* (manager) and a *chartophylax* (document keeper) in the financial and administrative governance of his diocese. The most prominent manifestation of the bishops' role in clarifying Christian doctrine, and of the principle of collegiality among them, is their participation in synods and councils. Once or twice a year the bishops of a province gather for a synod under the presidency of their metropolitan. As participants in ecumenical councils, they stand for the universal Church in its entirety.

The bishops acquired public prominence when the emperor Constantine ended the great persecution and extended his imperial patronage to the Christian Church. In convening the Council of Nicaea, he not only bestowed official recognition on the bishops as representatives of the Church, but also accorded them the privilege of imperial officials to travel by the imperial post. The council was attended by some 300 bishops, most from the eastern regions of the Roman empire. It solidified the shape of the ecclesiastical organization that had developed in analogy to the administrative and territorial structure of the Roman empire. Corresponding to the provinces of the empire were the dioceses of the Church. The largest city within such a territory (the metropolis) was the seat of provincial government and also became the seat of the metropolitan bishop, who presided over the bishops of the lesser cities within his diocese. Responsible for vast stretches of rural hinterland were *chorepiskopoi* (literally: "country bishops"). They were subordinate to their bishop, with whose approval they could ordain deacons and priests. This custom was prevalent especially in Asia Minor in the early Byzantine period, but lost importance by the 8th century, and had become obsolete by the 12th.

As a result of Constantine's advocacy of Christianity, Church and empire became coterminous. This also affected the role of the bishops. They were increasingly called upon by the imperial legislation to take an active role in the administration of their cities, to administer justice even in civil matters, to monitor the performance of imperial provincial officers, and to report abuses. The emperor Justinian, for example, stipulated in 530 that bishops had to collaborate with the city council in the supervision of public building works, road construction, and the maintenance of aqueducts and public baths.

At times of crisis, bishops often became the focal point of authority in their cities. During the periods of severe famine in the 6th century, they saw to the distribution of food and regulated the grain supply. In the course of the Persian and Arab invasions of the 7th century, they organized the relief efforts for the population and even became involved in the military defence of their cities. In subsequent centuries, as the properties of the Church increased, so did the power of the bishops. In addition to the city with its religious structures – churches, monasteries and convents, hospitals and orphanages – they were often in charge of a large territory with towns and villages. After the Council of Chalcedon (451) the bishops also held the authority over the monasteries in their diocese.

The letters and sermons by bishops of the Byzantine period give us a vivid picture of the concrete circumstances of their lives (Basil of Caesarea, John Chrysostom, Severus of Antioch, Leo of Synada). More formal treatises that deal with the various aspects of the episcopate were composed by the Church Fathers Gregory of Nazianzus (*On his Flight*), John Chrysostom (*On the Priesthood*), and pseudo-Dionysius the Areopagite (*The Ecclesiastical Hierarchy*). Many saints' *Lives* celebrate the deeds of holy bishops, such as the *Life of John the Almsgiver* and the *Life of the Patriarch Eutychius*.

Under the Tourkokratia, since adherence to Orthodox Christianity shaped the identity of the inhabitants of the former Byzantine empire, the bishops were important figures

of leadership, especially in fostering education by maintaining schools and institutions of higher learning.

Today, in the autocephalous Orthodox Church of Greece, bishops continue to play an important role in ministering to the pastoral and spiritual needs of their dioceses. In 1922 all episcopal sees were declared to have the rank of metropolitans. There are 81 dioceses, with an additional number of titular metropolitans and bishops with special missions. They convene once a year for the Holy Synod, presided over by the metropolitan of Athens.

Bithynia

Region of northwest Asia Minor

Bordering the Sea of Marmara, the straits of the Bosporus, and the southern shores of the Black Sea, and situated opposite Constantinople (Istanbul), Bithynia is today part of Turkey, and well known for its Byzantine fortifications and churches. Although originally confined to the peninsula of Chalcedon, it gradually extended eastwards to Heraclea and Paphlagonia and southwards across the Propontis to Mysian Olympus, a well-known Byzantine monastic centre during the iconoclastic period. Though mountainous and densely forested, it was one of the most prosperous regions of Asia Minor. Not only did it contain good pastureland, but it also produced fine timber and all kinds of fruits and grains. It was blessed with fine harbours, fertile valleys, and supplies of marble. The principal routes to the Anatolian plateau and to Pontus ran across it. However, its chief channel of communication was the Sangarius river which, with its tributaries, watered its fertile agricultural lands. As a corridor between Europe and inner Anatolia, Bithynia was situated in a strategic yet vulnerable position between east and west.

Bithynia was named after the Bithyni, one of the warlike Indo-European tribes that had emigrated from Thrace during the latter part of the 2nd millennium BC. In 560 BC the land was conquered by king Croesus of Lydia, but it fell into the hands of the Persians when the latter conquered Lydia four years later. However, foreign rule had very little effect on Bithynia, which retained its ethnic identity and survived into Hellenistic times under the rule of a local dynasty. It often waged war with the Greek colonies of the coast, and the warlike nature of its inhabitants saved it from complete domination by the Persians after the 6th century BC. It was occupied by Alexander the Great in 334 BC, although the warlike tribes did not fully submit to his conquest. After Alexander's death in 323 BC, Antigonus I ruled the land nominally for some time and founded Nicaea (modern Iznik), which subsequently became a prominent city of Bithynia. But the Bithynians regained their independence under Zipoetes in the early 3rd century BC. His son Nicomedes I established the first dynasty of Bithynian kings and ruled from 278 to 250 BC. In 264 BC he founded Nicomedia (modern Izmit) and made it his capital. He made an unsuccessful offer to pay the heavy public debt of the Cnidians in return for the *Venus* of Praxiteles. In order to protect themselves against the Seleucids and their rival Heraclea, the kings adopted a policy of both aggression and judicious alliance. As a result their power spread to inner Paphlagonia, to the fertile basins round Nicaea and Prusa, and eventually over the cities of the coast. Nicomedes invited into Anatolia as mercenary allies the warlike Celts who were subsequently settled in Galatia. This led to turbulent conditions in the land for many years thereafter. The country, however, prospered under his successors, stabilizing itself internally while shifting alliances and waging wars with powerful neighbours such as Pergamum to which, however, it lost some territory during the 2nd century BC. These kings founded cities and promoted Greek culture.

The kingdom reached the height of its power in the early 2nd century BC, but this was followed by a century of rapid decline under incompetent leadership. Its notable rulers were Prusias I (237–192 BC), Prusias II (192–148 BC), Nicomedes II (142–91 BC), and Nicomedes III (91–74 BC). The last mentioned was a close ally of the Romans, being little more than a Roman puppet, and on his death he bequeathed his kingdom to Rome. This led to the Third Mithridatic War (74–63 BC) when Mithridates VI of Pontus tried without success to prevent the Romans from annexing Bithynia. During 65–63 BC Pompey organized Bithynia and Pontus into a single Roman province for purposes of administration. Its capital was Nicomedia which, nearly three centuries later, became the imperial seat of Diocletian. To facilitate the maintenance of order and the collection of taxes, Pompey divided the territory among 11 cities. Much of the land was split up into large estates, especially in the region of Nicaea. Although this area was heavily exploited by the Publicani (tax-farmers) during the 1st century BC, and in consequence much land was transferred to Italian owners, under the empire it became very prosperous. The rapid recovery of these cities from the ravages of war speaks well for Roman rule.

At first, the new province was governed by proconsuls. However, under the Julio-Claudian emperors imperial procurators assumed greater responsibilities owing to the importance of the highways to the eastern frontiers and Syria as well as the maritime connections with the Black Sea. Under Trajan and Hadrian the proconsuls were replaced by special imperial legates, and this agreement became permanent from the time of Marcus Aurelius. Pliny the Younger was sent as propraetor to Bithynia to restore the solvency of some cities there, particu-

larly Nicaea and Nicomedia, which so rivalled one another in building as to risk bankruptcy. His correspondence with Trajan well reflects the conditions of Bithynian city life in the early 2nd century AD, while the speeches of Dio Cocceianus show symptoms of a booming but uncontrolled civic prosperity, as reflected in embezzlement by magistrates, lavish building programmes, bitter feuds between cities, and popular discontent.

Bithynia was the home of some well-known scientists and writers such as Hipparchus of Nicaea and Arrian of Nicomedia. It was also the temporary residence of the Latin authors Catullus and Suetonius, as well as the younger Pliny. Helena, the mother of the emperor Constantine, came from Bithynia. The *octophorus*, or eight-man litter, was particularly associated with the Bithynian kings. Bithynia became a separate province in the early 4th century AD, and continued to exist into the 8th century when Slav captives were settled there.

Under the Byzantine empire the territory of Bithynia was restricted to an area west of the Sangarius, and constituted a province in the diocese of Pontus. Although the growth of Constantinople eclipsed its cities, Bithynia prospered as a result of its position on the military and commercial routes between Constantinople and Anatolia. In the 7th century it became part of the Opsikion theme and was subsequently divided between that theme and the Optimatoi. Ecclesiastically, after 451 Bithynia was divided into the three provinces of Nicomedia, Nicaea, and Chalcedon. It was overrun by the Turks under Osman in 1298, and thereafter formed an integral part of the Ottoman empire.

D.P.M. WEERAKKODY

Summary

A region of northwestern Asia Minor, Bithynia was named after the tribe of the Bithyni which had emigrated from Thrace. It was taken by the Persians in 556 BC and by Alexander the Great in 334 BC, but it was never fully subdued. A successful dynasty of Bithynian kings ruled from 278 to 74 BC. In 65–63 BC Pompey organized Bithynia and Pontus into a single province. It was later part of the Byzantine Opsikion theme and was overrun by the Ottomans in 1298.

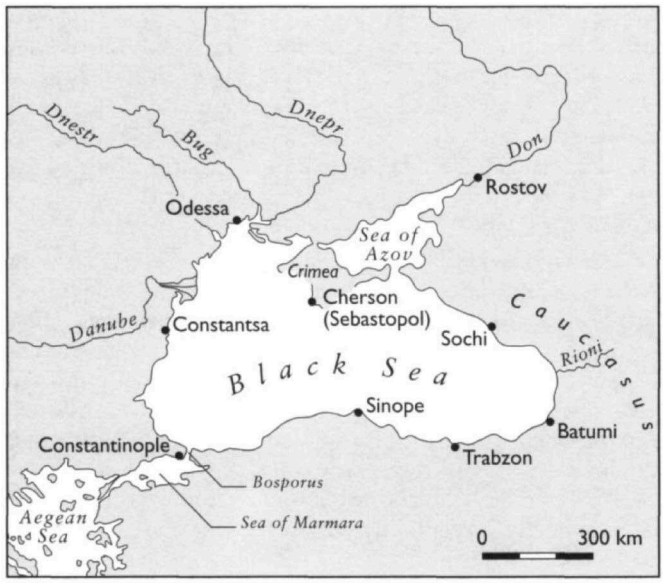
Black Sea

The Greek *Pontos Euxeinos* or *Axeinos*, Arabic *Bahr al-Nitash*, medieval Latin *Mare Majus*, Slavonic *Chernoye More*, and Turkish *Kara Deniz*, is called the Black Sea in most languages, probably in apposition to oriental concepts of geography by colour – e.g. the Yellow Sea and the Mongol Golden Horde were somewhere east or north, and for medieval Greeks (and modern Turks) the White Sea was the Aegean, while the Red Sea was also thought to embrace the Indian Ocean. Classical Greek explanations that the "hospitable" Euxine replaced the "inhospitable" Axine may mask an Iranian origin in variants of "black" *afshin*. Certainly non-classicizing Greeks call it so as the *Mavri Thalassa*.

The Black Sea is a vast basin, in shape a figure of 8 on its side, 1180 km in width from Thrace to Colchis (where the Argonauts sought the Golden Fleece) but only 263 km at its waist from the Crimea to Anatolia. This basin is filled by great rivers: clockwise from the Thracian Bosporus are the Classical Panysos (Bulgarian Kamcija), the Istros (Danube, the single greatest river, with many mouths), the Tyras (Slavonic Dnestr), the Hypanis (Slavonic Bug), and the Borosthenes (Slavonic Dnepr). The Tanais (Slavonic Don) percolates across the Sea of Maiotis (Azov), through the Cimmerian Bosporus, into the Black Sea proper. The Phasis (Rioni) runs down from the Caucasus to the most humid corner of the Black Sea. Indeed Batumi, known to French sailors as "Le pissoir de la Mer Noire", sustains a staggering annual rainfall of almost 2500 mm, while the western lobe of the sea attracts from 350 mm in the Crimea to 500 mm in Istanbul. From Anatolia on the south coast the Iris (Kizil) and Halys (Yeşil), the Red and Green rivers of Turkey, debouch through broad deltas.

The Euxine basin is tilted south, from floating weeds at the mouths of the Dnestr and Dnepr and the 8-metre shallows of the Sea of Azov below the Don, to a depth of 2245 m just north of Sinope. At some stage, still disputed by geologists, this great accumulation of fresh river water burst out through the Thracian Bosporus above Byzantium into the progressively more salty waters of the Mediterranean and, eventually, of the Atlantic. Yet this Bosporus is a mere pinhole. The result is that the Black Sea is sulphurous and lifeless below about 150 m. Through a double current, it has been estimated that the Bosporus can recycle the surface waters within 140 years, but the stagnant depths take up to 2500 years to renew. Nevertheless the Black Sea harbours some 180 kinds of fish, including an anchovy (*engroulis encrasicolus*, Aristotle's *amias*, Turkish *hamsi*) and Maiotic sturgeon, the produce of which, including varieties of caviare, were preserved for Lenten austerity in medieval Constantinople. But preservation requires salt, of which the sea itself is short. As Strabo observed, the fish which most attracted Greeks into it was the Greek *palamida* (Latin *pelamys sarda*, Turkish *palamut*, or English bonito), which gyrates clockwise round the sea, against its sluggish prevailing current. The palamida starts off life in the Danube delta in spring, and skirts the northern coast of Anatolia from Trebizond to Sinope where fishermen, with long rods, cluster to catch it in late summer. In autumn the palamida plunges down the Bosporus, returning from the Aegean in winter. Among other products, grain from the Balkans and northern steppe was first in bulk and significance. It was important to ancient Greece and medieval Italy and essential to Constantinople after Egypt was lost to Islam. There was Vlach cheese and Crimean wine, Scythian and Caucasian slaves – including Mamluks for Egypt. The 10th-century Varangian route down the Dnepr rapids brought products of the north, such as furs, wax, honey, amber, and pilgrims, to Constantinople in *monoxyla* (dugout canoes), and in turn gave the Mediterranean a back door to the Baltic where, unlike the Anglo-Saxons, the Vikings knew what a sponge was. Anatolia and the Caucasus exported minerals (silver, copper, tin, iron, alum, naptha); Trebizond wine, oil, and hazelnuts (once



9. Black Sea

known from Novgorod to the Nile); and Paphlagonia timber and livestock (which was brought to Constantinople either on the hoof or as bacon).

Such products of its hinterland might have brought Greek colonists earlier into the Black Sea were it not so inhospitable to shipping. Any Argonaut from the Aegean (the tale is only exemplary) faced a climb against the surface current up the straits of the Dardanelles, through the prosperous Sea of Marmara (where Proconnesus provided the white marble of Constantinople), and then a dash through the sphincter of the Bosporus, whence the Clashing Rocks spewed him into the further alarms of the Black Sea. It is not surprising that, while ancient Troy was a haven for porterage to the south, 7th-century BC Byzantium was a late-comer to the north. The tideless sea has few natural harbours. Typically, local boats are double-ended and hug the shore, up on to which they are winched. Oared craft, like the *Argo*, are hazardous and do not carry much. Along with portolan maps and double-entry book-keeping, the Italians introduced larger cargo ships from the 13th century, but few exceeded 500 tons and a 900-ton ship launched from Sinope in 1461 was a wonder of its day. The northern, shallower parts are liable to ice during three winter months and to sudden storms, which can snap masts in two as late as March. The Anatolian coast is free of fog for only three summer months. This means that ancient and medieval shipping from the south tended to transhibernate, which encouraged colonization on the alien shores. Nevertheless Euxine transport by sea was still more economical than by land (where the price of grain might double every 50 km), and allowed Constantinople the luxury of a double cuisine – based on both olive oil and animal grease. Depending on the weather, the sea was about two weeks' sail from end to end (by which route Georgians reached Mount Athos and Armenians Bulgaria) and, if lucky, just two days at its waist from the Crimea to Sinope: but many travellers hung around for months – a rhythm broken only when steam replaced sail.

Apart from grain, and perhaps wine and salt fish, most Euxine commerce was internal. Except for exploiting it, ports tended to turn their backs on their hinterland. External interest was in three stages. In the first the significance of the Greek colonies established from the 7th to the 5th century BC was largely cultural – the encounter of peoples of the interior with Classical Hellenism – and then strategic – the concern of Rome and Byzantium with how to deal with successive waves of steppe peoples from the 3rd to the 13th century AD, by acculturization, evangelization, or simply summer warfare. The pattern of ancient Greek colonization, from Megara but mostly Milesian, was strikingly replicated in a second stage from 1261 to 1475, by Italian stations from Venice (but mostly Genoese, and sometimes both). These were more miniature Hong Kongs than colonies, but opened a European window on the east to merchants such as Marco Polo and Franciscan missionaries throughout the Mongol empire. But such is the continuity of settlement in the first two stages that they may be taken together.

The *periplus* or circuit of major Greek settlement in the first two stages may be taken clockwise from and to the Bosporus, with the run of the palamida. On the west coast lay Mesembria (medieval Mesembre, modern Nesebur); Tomis (modern Constanţa, where Ovid was exiled); and Histria, whose shrunken walls were built against against 3rd-century Gothic and 7th-century Avar attack; its function was replaced by the medieval settlement of Vicina, up the Danube. The major Greek colony of the Crimea was Cherson, replaced as an entrepôt by Theodosia (medieval Caffa, modern Feodosiya), and finally, as a naval arsenal, by Sebastopol. Around Rostov at the mouth of the Don lay the shifting and most remote of ancient Greek and medieval Venetian colonies: Tanais (medieval Tana). The Cimmerian Bosporus was flanked on the west by settlements around Pantikapaion (medieval Vospro, modern Kerch) and, on the eastern Taman spit of the often autonomous Bosporus, by Tmutorokan (medieval Matrega). On the east coast lay Georgippa (modern Anapa), another integrated site of local and Greek peoples from the 5th century BC, and Pityous (medieval Pezonda, modern Pitsunda), whence St John Chrysostom was on his way to exile when he died in AD 407. The "deep harbour" of Bathys Limen (medieval Lovati, modern Batumi) may have been the best in the Black Sea, but led nowhere. Trapezous (medieval Trebizond, modern Trabzon) was not really a harbour, but led everywhere in Central Asia. Other Anatolian Greek settlements, concluding the circuit west, followed the same pattern: Kerasous (modern Giresun); Amisos (medieval Simisso, modern Samsun), which during the 19th century sprang from being a small Turkish village to the largest Greek city of the sea, controlling the Ottoman tobacco trade); Sinope; Amastris (modern Amasra); and Pontic Herakleia (medieval Puntarachia, modern Ereğli).

From 1475 to 1793 the Black Sea became an Ottoman lake, crossed by monks of Trebizond to the Danubian principalities, khans of Crim-Tatary, or pilgrim patriarchs of Antioch, all Ottoman subjects or tributaries. The third Greek phase of its history began with the Russian conquest of the north from 1793. Within reach of Constantinople and the warm sea of the Mediterranean, the Russians named Odessa with antiquarian zeal after the ancient Greek colony of Odessos, near Varna, changing its sex on the way, and the Orthodox Church found that St Andrew, the first-called Apostle, had put in there in 9th-century tradition on his anticlockwise *periplus* of the Black Sea

which began with Byzantium. Nevertheless Odessa attracted Greek settlers, and a revolutionary brotherhood, the *Philike Hetaireia*, was founded there in 1814, now memorialized in an excellent museum. After the Greek War of Independence and further Russian intervention, the Treaty of Adrianople of 1829 allowed southern access to the Black Sea again, when Greeks eagerly reinvigorated the old pattern, now largely commercial. In 1853 a Russian squadron sank a Turkish flotilla in the harbour of Sinope, precipitating the Crimean War. But the greater revolution thereafter was of steam over sail, in which Greek entrepreneurs participated. Septinsular Greeks (from Ithaca especially) cornered the Danube shipping trade. Sinope itself, the historic hub of the Black Sea, enjoyed a final period of prosperity as a coaling station. The 20th century brought a sequence of changes which has come near to concluding the third stage of Greek involvement in the Black Sea. In Sinope today a giant radar establishment faces an equivalent station in the Crimea, both now dormant. Ottoman Greek palamida fishers were replaced by Turks from Greece after 1923, but with the end of steam, they can only look at international shipping that has no call on Sinope, even for its fish, which struggle for survival in the now poisonous waters brought down by the rivers into the Black Sea.

Blemmydes, Nikephoros 1197–1272

Scholar and teacher

Nikephoros Blemmydes was born in Constantinople, the son of a physician. After the Latin occupation of the capital in 1204 he moved with his parents to Nicaea, where he studied medicine, mathematics, philosophy, and theology. His subsequent career in the Church was initiated by the patriarch Germanos II, who ordained him *anagnostes* (reader), deacon, and *logothetes* (patriarchal official). In 1235 he took monastic vows and was appointed *hegoumenos* of the monastery of Gregory Thaumatourgos in Ephesus. During the years 1239–40 he travelled to Mount Athos, Thessalonica, Larissa, and Ohrid in search of books, which were not available in Nicaea or Ephesus. In 1241 he founded his own monastery near Ephesus, but he did not manage to ensure its independence, so it finally became a *metochion* (dependency) of the Galesios monastery. In 1254 he was offered the patriarchal throne, but refused it and chose to remain a monk. He died in his monastery in 1272.

Blemmydes was one of the most learned and influential scholars of his time. He was also renowned as a devoted teacher, and among his students were George Akropolites and the emperor of Nicaea Theodore II Laskaris (1254–58). He left two versions of a remarkable autobiography, the *Curriculum Vitae et Carmina* (1264) and the *Autographia sive Curriculum Vitae* (1265). It has elements of a hagiographical work as well as some vivid passages with valuable information about his education and intellectual development. The arrogance and the exaggerations that this work contains in places give us a good idea of Blemmydes' difficult character.

Around 1260 he wrote an introductory *Compendium* in two books, the first summarizing logic and the second physics. The introduction to logic, which was written at the suggestion of the emperor, opens with the statement that logic is very helpful in understanding scripture. It gives in 40 chapters the contents of Porphyry's *Isagoge* and Aristotle's *Categoriae*, *De Interpretatione*, *Analytica Priora*, and *Sophistici Elenchi*, using the logical works of the ancient commentators as well as of earlier Byzantine scholars such as Michael Psellos. The introduction to physics contains 32 chapters, which briefly summarize Aristotle's *Physica*, *De Generatione et Corruptione*, *De Caelo*, and *Meteorologica*, following Olympiodorus, Simplicius, and Philoponus. In this work Blemmydes discusses with particular interest the notions of time and place and Aristotle's doctrine of the fifth element, i.e. aether, which in fact is the only point where he disagrees with Aristotle. Both introductions are quite brief and clear, especially suitable for teaching purposes. Although they are undoubtedly compilations from Aristotle and the previous commentators, they also show that Blemmydes was no mere copyist. He did include his own ideas on different occasions, and he rephrased the passages he borrowed from his sources in a way that proves he understood them. Even if they are not particularly original, these introductions were extremely influential both in the East and in the West, up to the 17th and 18th centuries – a fact that is clearly attested by the great number of manuscripts that contain them and which can be found in major libraries all over Europe.

In addition to his compendium, Blemmydes wrote two treatises on geography. The more concise of them is very similar to chapters 28 and 29 of his introduction to physics; the other is a guide to geography which turns out to be nothing more than a prose paraphrase of the poem by Dionysius Periegetes.

In his theological writings Blemmydes tried to harmonize Plato and Aristotle with Christian doctrine. He wrote treatises on the procession of the Holy Spirit, on faith (595–606), on virtue and its exercise as well as ascetic works and fragments of a Typikon. His other works include letters, medical treatises, verses, and the *Imperial Statue*, which belongs to the genre of the Mirror of Princes (which offers advice to a ruler) and in which Blemmydes gives ethical and practical advice to his student Theodore II Laskaris. It was paraphrased in the 14th century by George Galesiotes and George Oinaiotes in order to be more accessible to the layman.

KATERINA IERODIAKONOU

Biography

Born in Constantinople in 1197 the son of a doctor, Blemmydes moved with his family to Nicaea after 1204 where he studied medicine, mathematics, philosophy, and theology. Tonsured in 1235, he became abbot of a monastery at Ephesus. In 1254 he declined the

offer to become patriarch of Constantinople. He was a learned and influential scholar and teacher. He died in 1272.

Boeotia

Region of central Greece

The land of Boeotia is hemmed in by mountains on all sides. Along the Corinthian gulf the high mass of Mount Helicon and the lower pine-clad heights of Mount Cithaeron form the southern links in the great chain of mountains starting with Pindus in the north and continuing with Parnassus in Phocis. Parnassus in turn sends a spur eastwards to meet a spur of Cnemis, the two leaving only a gap of some 400 m for the course of the Cephissus river. This line forms the boundary between Boeotia and Phocis. From Oeta in Thessaly another chain advances until it meets Parnes, which stretches westwards towards Cithaeron, thereby separating Boeotia from Attica.

Within these mountains Boeotia lay split into two great basins, that of Orchomenus in the west and that of Thebes in the east, each of them quite distinct and separated from the other by the ridge of Onchestus. Copais, the largest lake in Greece for most of history, further served to divide Boeotia. Reaching from Mount Ptoos in the east to Helicon in the west, the lake left only a narrow ribbon of land to carry the road between Orchomenus and Thebes. Apart from the mountains Lake Copais, drained in the late 19th century, was the most conspicuous feature of the landscape, covering an area of some 360 sq. km.

The western basin of Boeotia is a patchwork of small plains and valleys separated from one another by bare, rugged hills, and watered by numerous springs and rivulets. The region was thickly settled, with Chaeronea, Lebadea, Coronea, and Haliartus each commanding the resources of level ground, and Orchomenus dominating the entire area. The eastern basin was marked by more and larger plains that supported numerous cities. The combination of good land and an ample, steady supply of water ensured prosperous farming. The openness of the terrain also permitted easy communication among cities. This region possessed the only good road to the sea. Its many cities included Thisbe, Thespiae, Plataea, Acraephia, Tanagra, and Aulis. Within the basin the centrally located city of Thebes was predominant. From the outset of the Persian Wars until the *pax Romana* Boeotia was the "dancing floor of Ares", the scene of countless battles, an epithet equally applicable to later ages.

Within the western basin the plain of Chaeronea, onto which ran the high road from northern Greece, formed the threshold to Boeotia. Commanding a fertile plain some 20 km in length and 3 km in breadth, the walled city of Chaeronea stood at the foot of the hills on the southern side of the plain. Its scanty remains include the theatre and the lion monument that marks the site of the battle there in 338 BC between Philip of Macedon and the Greeks. Sulla defeated the army of the Hellenistic king Mithridates there in 86 BC. From Chaeronea a main road led northeastwards to Orchomenus, the principal city of the western basin. The city stood at the southern foot of Mount Acontium immediately above Lake Copais. Connecting the city with its fortified citadel runs a long line of magnificent walls. Its most notable architectural remains include the tholos, or beehive tomb, and the remains of a palace, both of which testify to the greatness of Orchomenus during the Mycenaean period (*c.*1600–1250 BC). From the Classical period comes the newly found theatre, and from the Byzantine period dates the church of Koimesis tis Theotokou (the Falling Asleep of the Mother of God), built in the Bulgar architectural tradition. Orchomenus was also the site of the battle of Lake Copais in 1311, when soldiers of the Catalan Grand Company smashed the defenders of Frankish Greece.

South of Orchomenus lay Lebadea, overlooking a fertile plain that stretched from Mount Helicon to the Copaic basin. The city itself was always strategically significant owing to its location on the main road between the western and eastern basins. Its prominence in antiquity was due to the famous oracle of Trophonius, which functioned from the 6th century BC until the 3rd century AD. Lebadea flourished during the Middle Ages. The extant Frankish fortifications testify to its prosperity and military importance. During the 14th century it was fought over by the Catalans, Franks, and Navarrese, only to fall to the Turks in 1394. It was the second city in Greece from the time of the Turks until the War of Independence. Its magnificent 18th-century watchtower is still conspicuous evidence of its prominence. The route westwards from Lebadea to Thebes passed the valley of Coronea, at the entrance of which sat the city on a twin-peaked summit. Remains of the city are few, but in its neighbourhood stood the

renowned sanctuaries of Itonian Athena and Athena Alalcomenae. Coronea was additionally important because of its communications up the Phalarus valley to a highland route over Mount Helicon. Its topographical position meant that Coronea was the scene of several major battles. At the eastward end of the road stood Haliartus, one of the strongest points between Lake Copais and Mount Helicon. Situated on a low hill and surrounded by stout circuit-walls, Haliartus commanded a narrow pass that could not be outflanked, wherefore it too often became a battlefield. Haliartus possessed a small, but fertile, plain, and its low, fortified acropolis contained a temple and several other public buildings. Onchestus, to the east of Haliartus, occupied a low ridge between Copais and the Theban plain. Its significance was religious, political, and symbolic in nature. In the 6th century BC it was the seat of an amphictyonic league composed of several major Boeotian cities. There the Boeotians celebrated their unity by a common festival dedicated to Poseidon. Onchestus reached its acme in history as the political capital of the re-established Boeotian Confederacy of the Hellenistic period.

East of Onchestus lay Thebes, the principal city of the eastern basin and the capital of Boeotia. It controlled the large, fruitful Aonian plain in the north, and lay near both the Asopus valley to the south and the Teneric plain to the west. Its rich and open land, combined with ample and constant supplies of water, nurtured a thriving agricultural economy. The acropolis of Thebes was the low plateau of Cadmea, which has been the primary seat of inhabitation from prehistory to today. Remains of the city, however, are few. Nonetheless, Thebes played a distinguished role in Greek affairs throughout history, and at one point in the 4th century BC it was the greatest power in Greece.

Emanating north of Thebes was a road leading to Acraephia of which little remains, and a much more important route passed to the northeast of Acraephia to Aulis and Chalcis. Aulis was the best harbour in Boeotia. It was the point where Agamemnon sacrificed Iphigeneia before sailing to Troy, and from it Hesiod sailed to Euboea. It was the chief harbour of Epaminondas' naval programme of 364 BC, and served as a port for two large Hellenistic fleets. Its most famous monument was the temple of Artemis and its adjacent buildings. Almost due east of Thebes is Tanagra, situated in the eastern part of the plain of the Asopus river. It is Homer's "Graia by the sea". Little is left of the city except for fragments of the circuit-wall and the foundations of a few buildings.

Plataea was located south of Thebes at the foot of the major passes over Mount Cithaeron from Megara and Attica. As the portal of southern Boeotia, Plataea was the perfect base from which to guard the passes. Though not large, its plain was capable of sustaining a city of ample size. Plataea was most famous for the decisive victory won there by the Greeks over the Persians in 479 BC. After the battle the Greeks erected the altar of Zeus Eleutherios (Zeus the Free). Thereafter, it became insignificant apart from its Panhellenic festivals, which were still celebrated as late as the 3rd century AD. Southwest of Thebes in the eastern basin, Thespiae overlooked a small region of rich river valleys beneath low hills. It had access to the Corinthian Gulf by way of Creusis and farther west by Thisbe, both separated from Thespiae by mountains. Thespiae boasts only a few ruins, for in the 19th century French archaeologists destroyed much of its walls in search of inscriptions. It survived into the time of the Roman empire as a religious centre, owing to its Panhellenic festivals of Eros and the Muses.

Boeotia was prominent throughout history, but its grandest moments came during the Classical period. It survived the Persian Wars to emerge as a united people and government. In 447 BC it created a confederacy that introduced the first effective federal body in Greek history. Having helped to defeat Athens in the Peloponnesian War, Boeotia rose to ascendancy in Greece during the Theban hegemony. In the Hellenistic period Boeotia suffered decline, but rose again during the Roman empire. The Middle Ages saw the spread of Christianity through the region and economic prosperity that even innumerable wars never entirely destroyed. Only with the coming of the Turks did Boeotia again decline. In the 19th and 20th centuries Boeotia yet again enjoyed a prosperity that endures today.

JOHN BUCKLER

Summary

A region of central Greece, Boeotia is surrounded by mountains. In the 5th century its cities formed a confederacy which helped to defeat Athens in the Peloponnesian War. After the war Boeotia briefly dominated Greece during the so-called Theban hegemony. It declined during the Hellenistic period but rose again under the Romans. During the Byzantine period it was prosperous but declined again under the Ottomans. Its prosperity returned in the 19th century.

Books and Readers

The two main pre-alphabetic scripts in use in the Bronze Age, Linear A (used *c.*1800–1450 BC in Minoan Crete) and Linear B (attested in Mycenaean inscriptions from the 13th century BC), seem to have been exclusively employed for administrative recording. Writing and reading were confined to professional scribes.

In the early 8th century BC the alphabetic script was adopted in the Greek world from the east (the first examples date from *c.*740 BC). The absence of writing for many centuries had encouraged the oral mode of literary production, which the Homeric epics seem to reflect. Although writing and communication with written messages were known, Archaic Greece was predominantly a society of oral traditions (law, religion, history). Poetry (epic or lyric), whether orally composed or written down, was meant to be heard and was orally performed. Yet we hear of editions of the poems of Sappho and

Alcaeus arranged in a certain order, and we assume that there were books of them owned by the performers and by the poets themselves, who appear to have known each other's work. From the 7th century BC papyrus was used for writing purposes, becoming the main writing material around 500 BC. The Greek word for "book" (*biblion*) means papyrus strip, thus suggesting the primacy of the papyrus roll as a book form. Other writing materials included leather, and Herodotus (5. 8) mentions that the Ionians used leather rolls. Books were scarce, afforded only by magistrates such as the tyrants Polycrates of Samos and Pisistratus of Athens, who are said to have owned collections of books (Athenaeus, 1. 3a).

The papyrus plant grew mainly in Lower Egypt, especially the Nile valley, and from a very early date it served writing purposes in Pharaonic Egypt. Its manufacture involved cutting the stem into short segments, slicing the white pith into thin strips, and placing them vertically parallel to each other; over this layer a second layer of strips was placed horizontally; the two layers were compressed so as to become one, and the sheet was then smoothed with a stone. Afterwards dried sheets were glued together to form a roll, usually 6–8 m long; rollers often protected the outer sheets. The scribes normally used for a writing surface the inside of the roll, where the fibres are horizontal, allowing the pen to run smoothly along them. The text was arranged in columns (*selides*) of varying height and length. The writing was in majuscule script without word division, punctuation, accents, or breathings. Titles, mostly later inventions, and authors' names usually came at the end of the roll. The lack of a law of copyright made forgeries common. Divisions into books largely reflect divisions into rolls and are artificial for all Greek writers before the 4th century BC. The reader held the roll with both hands, rolling up and unrolling so that the required portion of text was in front of him. Reading in antiquity amounted to reading aloud. It was difficult to make references or to quote with precision. Hence ancient readers usually quote from memory.

In the Classical period the use of books (i.e. rolls) became widespread, as the testimony of a number of Attic vases clearly shows. Intellectuals wrote down their treatises and published them by reading them aloud or having them read out (*ekdosis*) by a literate slave (*anagnostes*). Socrates in the *Phaedo* (97b–98b) says that he heard read a book of Anaxagoras and subsequently procured it to read it by himself. Protagoras also published his *On the Gods* by having it read aloud. There is evidence for an organized book market, and we learn that Anaxagoras' works were available for a drachma (*Apology*, 26d). The plays of Aeschylus, Sophocles, and Euripides were also available in book form. Dionysus in the *Frogs* (52f.) reads Euripides' *Andromeda*, and Aristophanes' audience is able to consult books (*Frogs*, 1114). The dissemination of book culture in the 4th century BC made a teacher of writing and reading indispensable for the education of children (*Protagoras*, 325d–e). Although literacy levels varied, the habit of reading now became widespread, especially in higher social classes. Socrates praises a young man who spends money on books, and Aristotle was nicknamed "reader", since he used to study his books in solitude. The earliest surviving papyri with Greek texts (Timotheos, *Persai*, and the Derveni Papyrus) date from the end of the 4th century BC.

Until the end of the Classical period there were only private collections of books, often owned by an erudite individual such as Speusippus, Aristotle, and Arcesilaus or by a private institution such as the Academy and the Lyceum. In the 3rd century BC public libraries were built by the Attalids and the Ptolemies, in Pergamum and in Alexandria respectively. In the Museum in Alexandria the foundations were now laid for the editing of Classical texts. Such scholars as Zenodotus, Aristophanes of Byzantium, and Aristarchus showed critical acumen in their editions of Homer, Hesiod, and the lyric and dramatic poets. They invented critical signs to indicate spurious verses and repetitions; they marked the metrical cola; and they devised aids to the reader (e.g. punctuation, change of speaker). Their work led to a general rise in the standards of book production. Division and arrangement of the contents into books were now employed by the authors themselves. Greek books circulated widely in the Roman world, featuring in private libraries of intellectuals such as Cicero and Atticus. The Bible was now translated into Greek for the Greek-speaking Jews.

Book culture flourished in late antiquity and most surviving papyri come from this period. The availability of books encouraged the making of anthologies, miscellanies, and encyclopedic works. Scholars such as Galen, Aulus Gellius, and later Origen and Eusebius, hired secretaries to help them in compiling their books. Parchment now became available as a more durable alternative to papyrus. But the appearance of the codex, the ancestor of the modern book, as an alternative book form was the most important event in book culture. A codex consists of a number of wide sheets folded vertically in half and then stitched together so that a single sheet forms two leaves. The earliest codices date from the late 2nd century AD. For some time rolls and codices coexisted (3rd–4th centuries AD), but soon the codex prevailed and became the usual book form. Initially there were codices of both papyrus and parchment, but parchment soon became dominant. The establishment of the codex form was presumably due to its adoption by Christians. Early codices contained almost exclusively Christian texts. Systematic translation from rolls to codices took place in the 4th–5th centuries AD. The earliest extant codices are the famous Codex Sinaiticus and Codex Vaticanus of the Bible (4th century). Christians developed their own literature, and Christian centres of learning were established (Caesarea, Alexandria). Important collected editions appeared, such as Andronicus' edition of Aristotle, Thrasyllus' arrangement of Plato's dialogues, Porphyry's edition of Plotinus' treatises, and textbooks with selections of Classical authors for school use.

The codex was the usual book form in the Byzantine period, but the roll survived in the transmission of liturgical texts and in the imperial chancery. The dominant Christian culture affected book production. Prayer books, bibles, and psalters enjoyed the widest readership. The lower classes tended to read hagiographic literature, collections of patristic sayings, and popular stories (e.g. *Physiologus*), while the middle classes may have also read chronicles, history (e.g. the *Patria Constantinopolis*), and novels. Books of practical use, for example medicine, astrology, and of course school books, circulated widely. The Byzantine intellectual elite was largely preoccupied with Classical texts, thus ensuring their preservation for posterity. Ancient treatises were the models for the

Byzantines – from science to literature. Books were expensive, and, at least until the introduction of paper, only the affluent could afford them. Shortages of writing materials account for the use of palimpsests, i.e. manuscripts where the original was erased and a new text written over it.

The Byzantine renaissance of the 9th–10th centuries brought a revival in book culture. The first significant change in book production was the adoption of minuscule script in the 9th century and the transcription of majuscule manuscripts into minuscule. Most of our earliest manuscripts come from this period. Majuscule manuscripts of the years 600–800 have not survived. Photios in his *Bibliotheca* gives us an idea of the books that were available at that time. Some texts were already extremely hard to find – e.g. the historians Theopompus and Ctesias, available to Photios, were no longer available to Arethas a few decades later. Arethas's recensions included division of the text into chapters and paragraphs, as well as the addition of marginal comments, lists of contents, and bibliographical notes. Many monasteries housed important scriptoria, where monks with growing professionalism prepared copies of (mostly) ecclesiastical and (some) secular authors. Luxury manuscripts might include illumination and cover decoration. This flourishing book culture ceased abruptly with the sack of Constantinople by the Fourth Crusade in 1204. The stream of humanists in the 13th and 14th centuries very successfully carried out the task of preserving such Classical literature as then survived, so that few texts that the Byzantines had in 1261 have failed to reach us. The introduction of paper, a material originally invented in China and adopted by the Arabs in the 9th century, marks an important change in book production. By the 14th century parchment had been largely replaced by paper, much of it now produced in western Europe.

The fall of Constantinople in 1453 increased the flow of Greek intellectuals to Italy, where the Renaissance was blossoming. The demand for Classical texts was great, and Greek and western scholars organized missions to procure manuscripts of Classical authors from Constantinople. Many of them owned impressive collections of Greek manuscripts. The most important event regarding book production was the invention of printing in 1452. The grammar of Constantine Laskaris was the first Greek printed book, in 1476. In the 1490s Aldus Manutius set up a publishing house in Venice dedicated to the production of Greek Classical texts. In mainland Greece under Turkish rule almost 4500 separate publications are recorded between the 1500s and the 1820s, many of them reissues of existing works. Books with religious content predominate, principally printed by Greek printers in Venice. But in the 18th century the number of books with secular content rose considerably, and by the beginning of the 19th century they outnumbered books with religious content. This shift highlights the effect of the Greek Enlightenment. The Greeks became increasingly aware of the important scientific and cultural events taking place in Europe, such as new scientific discoveries, the French Enlightenment, and modern European philosophy, and the emergent Greek intelligentsia tried to transplant the new ideas into Greece. Intellectuals such as Moisiodax, Kodrikas, Doukas, and Korais draw heavily on western philosophical and scientific treatises. Books by prominent European intellectuals (Voltaire, Locke, Newton, Beccaria) now appeared in translation. Literature played a minimal role in this revival. Greek books were now being printed within the confines of the Ottoman empire, in Iasi, Bucharest, and in Constantinople, where a patriarchal press was set up in 1798. The first Greek newspaper (*Ephimeris*) appeared in 1797 and periodicals such as *Logios Ermis* (1811–21) were published. Levels of literacy were low among the Greek lower classes; those who could read preferred religious texts or popular literature such as the life of Alexander the Great, Aesop's *Fables*, *Bertoldos*, the *Story of Sosanna*, 17th-century Cretan literature, and translations of western romances. Some of this literature, notably the Cretan, was meant to be recited aloud rather than read silently.

The establishment of the modern Greek state in the 1830s brought a revival in the printing of books, newspapers, and journals. The language question divided book culture for a long time. The official language of the Greek state was the purified, archaizing katharevousa, which displaced the spoken demotic. Greek literature, strongly influenced by French culture, was mostly cultivated by an intellectual elite (the Phanariots). But around 1880 an intellectual change took place: talented prose writers appeared (Papadiamantis, Karkavitsas), and demotic started to gain ground. In the 20th century there was a considerable increase in the production of literature, but also an expansion of readership. In the last decades there has been an upsurge of book production. There are now more than 580 individual publishers as well as 40 to 50 institutions with publishing activity. Most are located in Athens (90.5 per cent) and in Thessalonica (8.1 per cent). In 1997 more than 5000 new titles came out (plus 3000 reprints). Literature (Greek, translated, and children's) enjoys the widest readership, with books of history, essays, technology, and classics coming next.

Bosnia

Part of Roman Dalmatia

The earliest mention of Bosnia occurs in *De Administrando Imperio* by the Byzantine emperor Constantine VII Porphyrogennetos (913–59). At first limited to the valley of the river Bosna, the name was later applied to a wider area. Once part of the Roman province of Dalmatia, Bosnia was originally inhabited by Illyrian tribes. Archaeological evidence shows an influence of the Greek colonies in the eastern Adriatic, including Narona, at the mouth of the Neretva. The long period of Roman rule left a stronger imprint. With the exploitation of mines and a new system of communications, the economy developed and urban settlements were created.

A proconsular province since Justinian's time, Byzantine Dalmatia suffered Avaro-Slav attacks and was finally colonized by two Slavonic tribes, the Croats and the Serbs, during the reign of Herakleios (610–41). By the 10th century Croats had settled between Istria and the rivers Cetina and Pliva, while Serbs occupied territory east of that line, bordering the Bulgarian state and the Byzantine theme of Dyrrachium.

As Christianity spread from the coastal cities, a bishopric was established in Bistue Nova (modern Vitez). The most important remains of early Christian architecture are at Blagaj, Breza, Dabravine, and Zenica. In the late 9th century the Old Church Slavonic liturgy was introduced by the followers of Saints Cyril and Methodius. Although the area was under the jurisdiction of the Roman archbishopric of Salona and later of Dubrovnik and Kalosca, liturgy in Old Church Slavonic was retained; the Cyrillic script eventually replaced the Glagolitic.

Bosnia was part of the Serbian state of Prince Časlav until 950. In the following period its local rulers (*bans*) had to confront the attacks of the Croatian king Krešimir and the Bulgarian tsar Samuel. When Basil II reconquered the Balkans for Byzantium (after 1014), Bosnian *bans* became his vassals. In the 12th century Bosnia accepted the supremacy of Hungary, but rejoined the Byzantine empire under Manuel I, who mentioned it in his imperial title. After Manuel's death in 1180, Hungary's suzerainty was restored. In the late 12th century a dualist heresy (Bogomilism) reached Bosnia. *Ban* Kulin (1180–1204) had to withstand accusations from Rome and Hungary: this was the beginning of a long struggle against the "Bosnian Church" in which Rome, the Hungarian kings, and the Dominican and Franciscan orders took a leading part. Kulin was a relation of Stefan Nemanja, a well-known opponent of the heresy in Serbia. An inscription found near Visoko mentions Kulin's portrait above the entrance to one of his churches. His charter to Dubrovnik, dated 1189, giving privileges to its traders, is one of the oldest preserved official documents in Serbian-Slavonic and in Cyrillic.

The region of Hum, comprising the valley of Neretva and the hinterland of Dubrovnik, came into the possession of the Bosnian rulers in the 14th century. These were parts of the Serbian state, with a bishopric established there by St Sava (after 1219). Other Orthodox centres of western Serbia were joined to the Bosnian state during the reign of Tvrtko I (1353–91). As the Serbian state disintegrated after the death of Tsar Stephan IV Dushan (1331–55), Tvrtko assumed the role of an heir to the Nemanjić kings to whom he was related. Referring to them as "my ancestors", he was crowned "King of the Serbs, Bosnia, the Littoral and the Western parts" by the Serbian Metropolitan at Mileševa, the burial church of St Sava. The coronation took place on the feast of St Demetrius in 1377 and was approved by Tvrtko's suzerain, King Lajos I of Hungary. Having added to his own the name Stephan, the traditional name of the Serbian kings, Tvrtko founded a new city near Kotor, which he put under the patronage of St Stephen (later Herceg Novi). On the western border, parts of Croatian Catholic lands were also joined to Bosnia. As the mining industry developed, Bosnian cities became prosperous centres of trade.

From Tvrtko's reign onwards, Bosnian history reflects the diversity of political and cultural influences which met on its territory. Religion continued to be an important factor. Catholicism was strong in the cities where miners from Saxony and foreign merchants had their colonies. Orthodoxy prevailed in the eastern parts of the country, while the "Bosnian Church" had its supporters (*patarens*) among the feudal lords. Among the most powerful was Stephan Vukčić Kosača, ruler of Hum, who in 1448 assumed the title of "Herceg of St Sava". His lands became known as Herzegovina. Vukčić's diplomacy, involving dealings with Rome, Venice, Dubrovnik, the kingdom of Naples, Hungary, the despotate of Serbia, and the Turks, illustrates the precarious position of the central Balkans in his time. Originally a *pataren*, he later favoured the Orthodox Church. In 1454 Patriarch Gennadios Scholarios reassured the monks of the Sinai monastery of St Catherine about donations received from Vukčić and advised them to pray for him. The churches of St George at Goračde and of Saints Sergius and Bacchus at Podi were Vukčić's foundations and his Orthodoxy is confirmed by the mention of icons and holy relics in his will.

By 1463 the greater part of Bosnia fell to the Turks who advanced also into Croatia and Slavonia. Although not imposed, Islamization gradually took place. Migrations, either spontaneous or forced, resulting from constant wars and devastation throughout Serbia and Bosnia-Herzegovina, became a feature in the following periods. Settlers in the border regions (Krajine), encouraged by the Habsburg emperors to continue fighting the Turks, were granted important privileges.

The pre-Ottoman cultural heritage of Bosnia-Herzegovina includes both Catholic and Orthodox churches and monasteries (with some monumental painting still extant) and many fortresses. Book illumination was practised in monastic and princely scriptoria. Of particular interest are the sepulchral stone monuments (*stećci*) with carved decoration, especially at Radimlja, Olovo, and Vlasenica.

The Orthodox churches, monasteries, and schools were governed by the Serbian patriarchate of Peć until it was abolished by the Turks in 1766 and the jurisdiction transferred to the Ecumenical patriarchate (until 1920). Many churches were rebuilt and received new fresco decoration in the 16th and 17th centuries, including Papraća, Lomnica, Ozren, Žitomislić, and Zavala. Icon painting and work in precious metal were renowned. In this activity much support was provided by the contacts with the Serbian monastery of Hilandar on Mount Athos.

Under Ottoman rule Islamic arts flourished. Patrons were Ottoman dignitaries who were often Islamized members of the local families. The best monuments were planned by Mimar Sinan and his contemporaries: mosques in Sarajevo, Banja Luka, and Foča; bridges at Višegrad, Mostar, and Trebinje.

With the decline of the Ottoman empire, revolts against the Turks became more frequent, culminating in the Serbian uprising of 1875 in Herzegovina. As Austria's political drive towards the east coincided with the emergence of a united South-Slav state concept, dreaded by the Habsburgs, the geopolitical role of Bosnia-Herzegovina became crucial. Occupied by Austria after the Congress of Berlin in 1878, it was annexed to the Austro-Hungarian empire in 1908. Austria promoted industry and trade and allocated lavish funds for the urbanization of Sarajevo. However, the agrarian problems were left unattended, as Ottoman feudalism remained unchanged. The new regime was based on Austrian bureaucracy and legislature, and the use of German language.

According to the 1910 Austrian census, the population of Bosnia-Herzegovina was 1,898,044, with Serbs (Orthodox) accounting for 43.49 per cent, the Muslims 32.25 per cent, and the Croats (Catholics) 22.87 per cent. Habsburg policies exacerbated friction between these groups. Initiated in that period and later fostered by Nazi ideology, a genocidal programme against the Orthodox Serbs and their culture was implemented by the Ustaše in the "Independent State of Croatia" (which included Bosnia-Herzegovina) during World War II. The Western Powers' disregard for the delicate nature of Bosnia-Herzegovina's history had tragic repercussions in most recent times.

Botany

Ancient Greek literary writers often mentioned plant names, but without revealing whether these meant much to their audience. Theocritus and Sappho decorated their verses with pretty names of plants, and a famous fragment of a play by Eupolis has a chorus of goats declaiming a (very inaccurate) list of the plants that they were supposed to eat. There is nothing to show whether ancient Greek countryfolk had a profound knowledge of edible and medicinal wild plants.

Theophrastus (*c.*371–*c.*287 BC), colleague and successor of Aristotle, and the author of the *History of Plants* and *Explanations of Plants*, is regarded as the father of botany. He was a busy teacher at the Lyceum with many other interests, who probably had little time for botanical research. He seems to have known (at first or second hand) some 300 out of the 6000 species of wild plants that can today be found in modern Greece.

To judge by the *History of Plants*, Greek botanists were interested in five aspects of botany: (1) the structure and physiology of plants – for example, whether roots and shoots grow simultaneously; (2) the cultivation and propagation of field, orchard, and garden crops; (3) the occurrence and uses of wild trees; (4) drugs and medicinal herbs; (5) the occurrence of plants in particular localities.

On drug plants Theophrastus overlaps with the contemporary or earlier corpus of works associated with Hippocrates, later to be developed by Dioscorides and Galen, the great physicians of the early Roman empire. Herbs, gathered by professional herbalists, were evidently articles of commerce; Crete, with its many endemic species, was a special source.

Theophrastus does not stand alone: he mentions earlier botanists whose works do not survive. Many of his known successors were Roman rather than Greek. The technology of cultivation was taken up with greater success by Columella, Pliny the Elder, and Palladius Rutilius.

Ancient Greek botany laboured under many difficulties, beginning with that of identification and taxonomy. Botanists need to know which species of plant they are talking about. Writing a workable description of a plant, one from which someone else can recognize that plant, was a skill not far advanced in ancient times. Theophrastus mentioned brief points of difference between two or three similar species, but

rarely, if ever, gave enough information to identify an unknown plant. Dioscorides attempted the systematic description of plants; in an early Byzantine manuscript his descriptions are accompanied by illustrations copied from a lost work by Crateuas; fewer than half of these actually describe or depict a recognizable plant. Botanical illustration was a skill known to the ancient Greeks, but illustrations were not accurately reproduced until the invention of woodblock printing in the Middle Ages. Without the means of identifying plants and explaining that identification to others, the science of botany could not get far. The ancient physician often did not know what exactly he was prescribing for his patient.

Even worse was the ancient Greek vice of theorizing from small amounts of data. Although this led to some success in astronomy, it could not cope with the complexities and irregularities of plant life. *The Explanation of Plants* poses such vaguely physiological questions as "Why are not all plants more fragrant in hot countries?" Its "answers" lead into a morass of abstraction and generality, Aristotelian logic at its worst, having virtually no contact with actual plants. There is no sign of the patient collection, verification, and comparison of data from which real insights might have been gained; nor of the procedure of producing a theory from existing material and then seeking fresh data with which to test it.

Theophrastus collected information about tropical plants from remote parts of the world. But he valued information not for its own sake but in order to illustrate whatever theory he was writing about. Not much of a traveller, he relied on what others told him, and displayed little interest in verifying his data. He put into circulation some misinformation that is still current: for example, the notion that ivy destroys the tree on which it grows, which he could have disproved without leaving Athens.

However, he has some genuine insights into the behaviour of plants, noticing, for example, that firs like shade and pines like sun. At one point he attempted an ecological account of an actual place, the seasonal lake of Copais, with its unique reeds, and special craft of musical-instrument-making.

Evidence suggests that the ancient Hebrews and Romans were better botanists than the Greeks: much of Theophrastus' material comes from Italy, where he had never been. This conclusion, however, depends on surviving writings, which are presumably only a small fraction of the literature that once there was. (In other fields, such as engineering and shipbuilding, the Greeks' achievements were far greater than we would suspect from the written evidence.)

By way of the Romans, the Byzantine *Geoponika* of the 10th century AD, and the Arabs, Theophrastus' legacy regarding cultivated plants was carried forward to initiate modern agricultural writing, in the form of the works of Alonso de Herrera in the 16th century. Ancient herbalism continued into Byzantine times, as shown by the attention paid to Dioscurides and his illustrations. This is the source of the post-medieval western tradition of herbals, which developed into modern botany. It was also an impetus to the development of modern plant taxonomy, as early modern botanists visited Greece and other countries to try to identify and recover Dioscurides' drug plants. The herbalistic tradition continues in Greece to this day: *Votanotheriapeutiki*, a herbal by I.K. Prinea and A.M. Sphakianaki published in Athens in 1980, is explicitly in the Dioscuridean tradition.

In some parts of modern Greece there is a precise and far-reaching vernacular knowledge of medicinal and edible wild plants. Many Cretan countryfolk are fully familiar with their island's wealth of endemic plants, and are able to give the name of each one, together with their virutes.

Botsaris, Markos 1790–1823

Souliot hero in the War of Independence

Markos Botsaris, an important Souliot leader in the Greek War of Independence, became an icon for the courage of the Souliot warrior. Like many other great Greek warriors before him, he possessed such admirable personal qualities as bravery, endurance, a strong attachment to his native land and people, and above all a fierce devotion to freedom.

When Ali Pasha took over Souli in 1803, he abandoned all the favouritism that he had shown the Botsaris family while Markos's grandfather, George, and later his father, Kitsos, were in his employment. The pasha's persecution of the Botsaris family was as vigorous and savage as it was of all the Souliots. Many of their close relatives and friends were killed by the pasha's army. The surviving members of the clan, including Markos's father, were exiled to the Ionian island of Corfu where they came under the protectorate of the British. It was here that Markos and his father joined foreign armies, as was customary for Greek warriors in exile, Markos serving in an Albanian regiment under French command.

By the age of 10, Markos had begun his training in the use of arms. Like the great Spartan warriors of antiquity, the Souliots were taught to fight from an early age. They learned to move quickly and to take cover when and where they could. The Souliot warriors were renowned throughout the country for the fierceness with which they fought their battles, their ability to endure great deprivation, and the perseverance with which they strove to win their freedom.

Markos's education had begun early in Souli and probably continued during his exile on Corfu. In an attempt to help spread the Greek language, in 1809 he wrote a simple Greek–Albanian dictionary, which is in part preserved in the French Bibliothèque Nationale. In 1980 Tito Giohalas added it to the series of publications of the Academy of Athens.

The passionate love of his home finally brought Markos back to Epirus in 1819. Soon after his return from exile, he conducted negotiations with Ali Pasha which provided for the return of Souli to the Souliots in exchange for their assistance

in opposing the sultan's forces. It was at this time, through his successes on the battlefield, that Botsaris gained the respect and admiration of his fellow Souliots, and renown among the leaders of Greece. He became the commander-in-chief to the Souliot forces after the demotion of Georgios Varnakiotis, who was suspected by the parliamentary authorities of striking an bargain with the Turks. Such changes of allegiance were not uncommon among the Greek and Turkish warriors of the Greek War of Independence. Botsaris himself had fought at one time against Ali Pasha's Albanian army, while at another he had fought alongside the pasha against the sultan's beleaguering forces. The ultimate goal of freedom, however, remained constant.

In July 1822, with a force of 300 warriors, Botsaris joined the Greek army at Komboti. The first battles at Plaka were successful, but later the Turkish forces took the advantage. With his remaining 32 men, Botsaris left at once for Peta, but this proved to be another disappointing defeat.

Not dissuaded by such defeats, Botsaris continued to harass the Turkish army at every turn. As winter approached in 1822, he went to assist Alexander Mavrokordatos in his defence of Missolonghi, helping to fortify the city and prepare for the advancing Turkish forces. He was also to prove himself a very capable diplomat in the Greek attempts to sow the seeds of dissension among the Turks. In a ploy to gain the time needed to receive supplies and reinforcements, Markos met the Turkish military leaders, Omer Vrionis, Mehmed Reshid, and Yusuf Pasha, with various false proposals for capitulation. At great risk to himself, he carried out this and other cunning deceptions until the government, persuaded by Mavrokordatos as to the importance of a stronghold at Missolonghi, sent reinforcements. Garrisons led by Mavromichalis, Zaimis, and Londos were included among the new arrivals.

In recognition of his abilities, the government gave Markos Botsaris the title of general, which sparked some dissension among the other chieftains of western Greece. But Markos impressed upon them the important role that unity would play in the successful liberation of Greece from the Turkish yoke. He pointed out that generals are made on the battlefield and, with this, kissed the diploma (which he had received along with the title of general) out of respect for his country, and then tore it into small pieces. This powerful demonstration won the confidence of his fellow chieftains, who all agreed to work together in earnest.

Perhaps the most famous of Markos's battles was his final one. Following the successful defence of the first siege of Missolonghi, Markos and his Souliot warriors, some 1000 men, went to Karpenisi where the Turkish-Albanian forces were ten times that number. Botsaris and his men attacked at night, taking their opponents completely by surprise, and succeeded in killing nearly 800 Turkish-Albanians. After only a short period of fighting, in an attempt to reach the tent of the pasha whom he wished to kill personally, Botsaris was hit by a stray bullet in his right eye and was able only to call out: "I've been hit, brothers!" In order to conceal his death so that the other soldiers would not lose heart, the Souliots covered his body with a coat. Later, his body was carried off the battlefield over his cousin's shoulder to be taken back to Missolonghi, where he was given a hero's burial. Unfortunately, the sense of victory after this battle fell short of its true advantage. Having lost their commanding chief, the Souliot soldiers were to become once again the undisciplined clan that they had been before Botsaris's leadership.

Markos Botsaris's heroism has been honoured in the works of such great Greek poets as Solomos, Kalvos, Palamas, and Balaorites. His bravery has been applauded in plays by Zampelios, Soutsos, and Alkeos. A statue of him resides in the Plateia Botsaris in Missolonghi, at the Museum of the Revolution. His tragic death is depicted in four of Iatridis's ink drawings. His courage and fierce patriotism have been the subject of many klephtic ballads. One such heart-rending ballad describes the agony with which the loss of this great hero was mourned by his fellow Souliots, as well as by the whole of Greece.

JACQUELINE PETROPOULOS

Biography

Born in 1790 in Souli, Botsaris was exiled with his father to Corfu. There he served in an Albanian regiment under French command. Returning to Epirus in 1819, he became commander-in-chief of the Souliot forces. During the War of Independence he was revered for his bravery and dedication to the cause of Greek freedom and given the rank of general. He died in battle at Karpenisi in 1823.

Bouboulina, Laskarina, *c.*1770–1825

Heroine of the War of Independence

Laskarina Bouboulina was born in Constantinople, where her father Stavrianos Pinotsis was imprisoned for his participation in the Orlov revolution of 1770. After Pinotsis's death in Heptapyrgeio prison his wife Skevo emigrated from her native Hydra to Spetses, where she married Demetrios Lazarou, a prosperous sea captain. Both islands had been settled in the early 18th century by Albanians whose maritime activities were exempt from the fiscal administration of the Porte; together with the Greek islands of Psara and Kasos, which enjoyed similar exemptions, these islands were to contribute the greatest number of ships to the Greek cause during the War of Independence.

Waxing tall, dark, and athletic, Laskarina married Demetrios Yannouzas, a sea captain, probably in 1788. She bore him three children before his death at sea in 1797. The eponym by which she is universally known derives from the name of her second husband, Demetrios Bouboulis, a wealthy Spetsiot shipowner and captain, to whom she bore three more children. On his death in 1811 Bouboulina was a wealthy woman. When the Porte sought to confiscate her inheritance on the grounds of Bouboulis's participation in the Russo-Turkish War she sought the protection of the Russian ambassador Stroganoff; by contriving an audience with the mother of the sultan she won protection for her property.

Bouboulina was apparently initiated into the *Philiki Hetaireia* during a stay in Constantinople. On her return to Spetses she undertook to build several ships. At 48 cubits and 18 cannon the frigate *Agamemnon* surpassed the prescribed limits for private vessels; Bouboulina is said to have bribed the *kapitan* Hussein Pasha into permitting its use.

During the Napoleonic wars Spetses and Hydra had profited from western European demand for imported grain. This prosperity abated when grain prices fell after the peace of 1815 and again after the good European harvest of 1820. The *Hetaireia* found the inactive sailors and merchants of the islands receptive to promises of Russian support for an insurrection. Spetses was the first island to declare independence, in late March or early April 1821.

On 4 April 1821 Greek forces besieged Nauplia; on the same day Bouboulina and the *Agamemnon* arrived in the Gulf of Argos together with the ship of the Spetsiot notable Gikas Botasis. Bouboulina obtained several more ships from Spetses, and a blockade of Nauplia was effected. On 10 April, Easter Sunday, the Turks broke the land siege. Bouboulina disembarked at the Mills of Argos (Myloi), and on the fourth day after Easter she rode into Argos to a grand reception. According to Philemon, the people of Argos saw her as another Telesilla, the Argive poetess who armed the women of Argos after its defeat by Cleomenes of Sparta (Plutarch, *Moralia*, 245 c–f). Bouboulina and Botasis provided money, munitions, and a boost to Greek morale which made possible the resumption of the siege of Nauplia. On 25 April her son Yannis Yannouzas was killed in the defence of Argos. Bouboulina is said to have reported to the administration of Spetses: "My son is dead but Argos is still ours." In May she left her brother in charge of the blockade at Nauplia, and sailed with the *Agamemnon* to assist at the blockade of Monemvasia. The impregnable fortress was starved into submission on 5 August 1821. By mid-September Bouboulina left the Mills of Argos to be present for the anticipated fall of Tripolitsa. Kolokotronis and Petrobey Mavromichalis allowed her to enter the city in order to persuade the harem of Khurshid Pasha to give up their money and jewels in return for safety. As the Greek army became aware that the six-month siege was being prolonged by such private negotiations designed to reserve the booty for their chiefs, their indignation was such that they contrived to storm the city without their leaders on 5 October 1821. The anarchic sack of Tripolitsa, during which perhaps 8000 Turks were killed, was a blow to the authority of Kolokotronis. Shortly thereafter Bouboulina's daughter Eleni was engaged to Kolokotronis's eldest son, Panos.

Bouboulina then returned to the siege of Nauplia; when the city fell in December, she was again accused of intriguing with Kolokotronis for the wealth of the Ottoman women. Frantzis reports that on being sent to scout the Ottoman ladies Bouboulina concealed many valuables in her bosom, few of which were declared to the state commission. Panos Kolokotronis and Eleni Boubouli were married with pomp at Nauplia. Panos was named the garrison commander and Bouboulina was installed as the leading figure of the city.

It was Bouboulina's kinsmen from Hydra and Spetses who would oust her. The approval of a British loan to Greece in the amount of £300,000 became the occasion for a civil war which pitted the party of Kolokotronis, including Bouboulina, against the government of the Spetsiot Botasis and the Hydriot notable Konduriottes, who as president was designated recipient of the loan. This "war of Kolokotronis" was resolved in June 1824 when Panos Kolokotronis agreed to surrender Nauplia in return for a share of the money. Konduriottes in turn refused to enter the city until Bouboulina was evacuated.

Bouboulina returned to Spetses where the travellers Emerson and Pecchio met her in May 1825. They report her response at the news of Kolokotronis's imminent release: "If it's true, I'll return to the army with him to fight the Turks." In the event, she was killed on 22 May by Yannos Koutsis, in revenge for his sister's elopement with Bouboulina's son.

Of the many women associated with the Greek revolution, such as Mado Mavrogenous, with whom she might be compared, Laskarina Bouboulina – an Arvanitissa and native Albanian speaker – retains the greatest hold on the Greek imagination. She has been celebrated in verse by Soutsos and others; novels and a tragedy have been composed about her. Her sculpture can be seen on Tinos and Spetses, and her home in Spetses is open to the public.

C.G. BROWN

Biography

A native Albanian speaker, Bouboulina was born in Constantinople *c.*1770. Returning to Hydra with her mother, she moved to Spetses and in 1788 married Demetrios Lazarou, a ship's captain. After his death in 1797, she married Demetrios Bouboulis, a wealthy shipowner. He died in 1811. She joined the *Philiki Hetaireia* and agreed to supply ships to the war effort, notably for the siege of Nauplia in 1821. She was murdered in 1825.

Brigandage

Brigandage was endemic in the mountains of continental Greece throughout the period of Ottoman administration. The Greeks who engaged in this activity were generally young bachelors belonging to the mountain villages and transhumant shepherd communities in the area where they operated. They shared with the inhabitants of the mountains, who were also their principal victims, the same social values predicated on notions of honour, pride, and shame, and the same social institutions which protected the material interests and social reputation of the family. Before the War of Independence brigands were known as "klephts", a term which in one sense simply means "thief", but carried more complex associations in patriotic claims to heroism and sometimes countercharges of brutality. Klephts were generally shepherds or villagers who through debt, sheep theft, homicide, or other troubles had fallen foul of the Ottoman Turkish authorities and taken to the hills. They lived by levying protection money from villagers or by looting their houses. Captives were also held to ransom, and normally decapitated if the stipulated sum was not paid. To combat these breaches of order the Ottoman authorities recruited bodies of local militia known as *armatoloi*, who were similarly men-at-arms, very often former klephts who had regained respectability through amnesty.

Klephts and *armatoloi* together formed a complementary security system that cost the Ottoman Turks very little. A captain of *armatoloi* granted the klephts in his district a certain tolerance since only their existence justified his own employment. Klephts aimed to cause just sufficient disorder to encourage the authorities to give them, in turn, amnesty and employment as *armatoloi*. The victims were, of course, the villagers, taxed by the *armatoloi* and raided by the klephts.

The fate of this klephtic tradition in the new state of modern Greece was ambiguous. It was hardly satisfactory to have to admit that many of the glorious heroes of the War of Independence had previously heen brigands, and that during the course of the war some klephts had even re-entered Turkish service. The klephts now had to be portrayed as patriots resisting Turkish rule. This indeed, in a sense, was true, but it was incidental to the other purposes of the klephts already described. A heroic pastoral existence that included killing Turks, tossing the boulder, and Homeric feasting was attributed to them by folklorists and historians (not always Greek), a romantic construction far removed from the reality of klephtic life, which was generally short and often brutal, for both the klepht and his victims.

After the war many of the irregulars found it impossible to return to the unprestigious and unrewarding toil of peasant farming. If they could not find service in the Greek government's own irregular contingents, they turned again to brigandage, though they were no longer officially known as klephts. That term was too closely linked to the heroes of the War of Independence to be sullied by association with common brigandage. They had now become *listes*, common thieves and freebooters. Yet circumstances would again conspire to call on these men to join their illegal activities to a more patriotic cause.

The frontier of the new Greece, set up by the European powers, ran between Arta and Volos, excluding from the nation state more Hellenes than it included. Greece was inexorably drawn into repeated attempts to liberate Greeks still living under Ottoman rule. Its small regular army, essentially intended for internal security and ceremonial, could not hope to match the Turkish forces; nor was Great Britain prepared to allow Greece (always vulnerable to naval blockade) to contribute towards any further weakening of the Ottoman empire. In this pattern of relations brigands found their place. Whenever domestic difficulties or irredentist pressures dictated, the Greek government encouraged the formation of irregular bands to cross the frontier and foment revolt among the Christian population. The operations of irregulars could not be attributed to the Greek government with the same certainty as invasion by regular forces; and they had the added advantage that they exported the depredations of brigands to Turkish territory.

It was almost the end of the 19th century before these tactics were abandoned, partly because the revolts that they provoked regularly failed, partly because brigandage itself lost its local support with the gradual restriction of the transhumant pastoral economy in the mountains. (Many brigands were shepherds.) Moreover the political patrons of leading brigands who in the past had protected them from prosecution and used them to exert pressure at elections, or create disorder to embarrass the government, increasingly found such clients a political liability in the gradually developing state.

Klephts organized themselves in bands generally numbering between 20 and 30 men, about the number which a leader without the support of hierarchical discipline could reasonably dominate by the force of his personality. Bodies of klephts consisting of as many as 400 men were invariably temporary confederations of smaller bands which did not surrender their identities. The leader of a band was known as the *kapetanios* (captain) or *protoklephtis* (the first klepht), and his followers as *pallikaria*. The term *pallikari* emphasizes the parallel between its use in describing the duties of the young unmarried son or brother who guards the family honour, and its application in marking the role of the klephtic hero, also as a rule unmarried. The band in some respects resembled, and was modelled on, an extended family without the presence of women, the same kinship basis as that of the typical transhumant shepherd group, the *tselingato*, from which many klephts were drawn. In such bands there was generally a nucleus of two or three brothers, cousins, or kinsmen, who provided the leader with unquestioning support. Between these men and the other unrelated klephts a network of ritual relations was created through blood brotherhood. In a society where unre-

lated men were mutually hostile and untrusting, the *vlamides* or *bratimoi* ("blood brothers") owed each other the trust and straight dealing on which their survival depended – in the same measure as brothers.

A band of klephts operated in an area known to the captain and his closest associates. Kinsmen in villages and shepherd encampments provided intelligence and food (meat, flour, and salt), without which they could not survive or plan rational operations. In their mountain wilderness, the klephts created what order they could, establishing a number of *limeria* (camps) in inaccessible positions, between which they circulated to avoid surprise. As far as they were able, they paid great attention to their clothing and their arms, on which the leaders especially were prepared to spend extravagantly. In common with *armatoloi* and Albanian soldiers, they wore the white fustanella kilt, elaborately decorated waistcoats with silver buttons, and silver knee-plates when they could be afforded. Personal cleanliness was not a concern and it was a matter of professional pride that their kilts had become grey with encrusted dirt and grease. They armed themselves with long guns, curved swords with a fine cutting edge, and daggers, all of which could be very elaborately decorated. This concern with the display of pride, of appearing above others, was a form of visual boast, which also had the effect of discouraging their opponents.

Britain

Britain has felt the strong influence of Hellenism in literature, education, political and social ideas, and the visual arts, notably architecture. The country has served as a refuge for the persecuted and exiled, providing social and economic conditions that allowed Greek enterprise to flourish. Thus in the 19th century England became a centre of Greek commercial and maritime enterprise, and in the 20th century a home for a large Cypriot community. Today Britain is host every year to many thousands of students from Greece and Cyprus. In the other direction Britain has been important to the Hellenic world as a source of political and social ideas, an inspiration in literature, and a Great Power that played a determining role in the political evolution of the modern Greek state.

Greek seamen had penetrated to Britain by the 5th century BC and the traveller Pytheas of Marseilles who circumnavigated the British Isles in the late 4th century BC left a good account of this journey, which is reproduced by Strabo. In the Christian era there were contacts between England and Byzantium by way of the Carolingian courts. The Greek scholar and teacher Theodore of Tarsus occupied the see of Canterbury in the 7th century AD. Fine Byzantine silver artifacts were found in the Sutton Hoo ship burial (7th century), and the influence of Byzantium can be seen in Anglo-Saxon arts of the 10th and 11th centuries.

In the dark period after the fall of Constantinople, when Greece was lost to western European knowledge, a number of Greek scholars and mercenaries found their way to Britain. From the 16th century British trade in the Levant, conducted largely with Greeks, led to renewed interest in the Greek Orthodox Church and in the state of affairs in Greek lands. The contacts of Cyril Lukaris, the "Calvinist patriarch" (died 1638), with England contributed to this: it was at Cyril's initiative that the printing press set up for the London Greek commercial community by Nicodemus Metaxas of Cephalonia was brought to Constantinople and began to publish theological works in Greek. A Greek theologian, Nathaniel Conopius, later archbishop of Smyrna, incidentally introduced coffee to Oxford and London in the mid-17th century. By 1677 there was a sufficient community of Greek businessmen in London for them to found a (short-lived) Greek church in Soho.

Alongside these commercial and theological links, which extended to an abortive exploration of union between the Orthodox and the Anglican Churches, British 17th-century travellers and patrons helped to foster a new interest in the artistic heritage and the present state of Hellenism. John Milton was an early representative of what came to be called Philhellenism. English collectors began to take an acquisitive interest in Greek antiquities. The publication of Stuart and Revett's *Antiquities of Athens* in 1762 on behalf of the Society of Dilettanti was a turning point in the diffusion of knowledge of the Hellenic heritage. British travellers and philhellenes made a major contribution to the "rediscovery" of Greece, and to creating the climate of opinion in which the independence of the Greek state became feasible. Byron's contribution to awakening the conscience of Europe to the Greek cause was such that he is still revered by all Greeks.

The influence of British political and social ideas and administrative practice can be traced in Greek thought from the late 17th century, and was felt directly in the Ionian islands during the British protectorate from 1814 to 1864. But the primary external influence in the consolidation of the institutions of the modern Greek state was German, exercised through the Bavarian monarchy of king Otho. British liberal and free-trading ideas were attractive to the rising Greek bourgeoisie represented in the early 20th century by Eleftherios Venizelos, whose close understanding with Lloyd George and belief in the need to align Greece with the dominant maritime power in the Mediterranean led to the national schism in Greece in World War I and thence to the catastrophe at Smyrna and the uprooting of Hellenism from Asia Minor.

The main interaction of the two countries and traditions in the 19th and 20th centuries has been strategic and maritime, Greece playing an important role in Britain's approach to, control of, and influence in the eastern Mediterranean region, and Britain being seen in Greece as a key strategic factor (and at crucial times an ally) from the time of independence until after World War II. In the case of Cyprus, briefly occupied by Richard I in 1191 (and then sold), occupied again by Britain in 1878, and later a crown colony until the establishment in 1960 of the independent Republic of Cyprus, the strategic interest is

still evident in the presence of British sovereign base areas on the island.

The Hellenic presence in Britain today consists of an economically dynamic business community centred on shipping and working in the City of London; a transient population of more than 20,000 students, undergraduate and post-graduate, at British universities; and a large permanent population of Greek Cypriots concentrated mainly in north London. A small Greek commercial community has been present in London since the 17th century; but the rapid growth in importance of the community dates from the late 18th century, when merchants mainly from Chios began to establish trading houses with networks extending from southern Russia to Constantinople and Smyrna to Livorno, Marseilles, and London. This emigration was given an enormous boost by the tragic effects of the Turkish massacre of Chios in 1822, which pushed members of the prominent Chiot trading families into emigration. The largest of the great Greek trading houses, Rallis Bros, first established its London office in 1818.

This community of Greeks, drawing on their widespread family networks and applying their commercial acumen in the British liberal free-trading environment at a time of expanding European trade, established their offices and homes in the City of London around Finsbury Circus, and from modest beginnings grew mightily between 1820 and the middle of the 19th century. Their trade was the import of grains from Russia through Odessa, and the export of textiles and manufactured goods. From the middle of the century on, some firms extended their commerce to India, where a great part of the Rallis activity and fortune was made. The prominent families, Rallis, Argentis, Schilizzis, and others, governed the affairs of their community through a committee or brotherhood. Their houses, their churches, first in London Wall, then the St Sophia cathedral in Bayswater, consecrated in 1876, and their funereal monuments at the Greek cemetery in West Norwood, are witness to a solidly prosperous community, characterized by intermarriage between prominent families. Greek traders from Chios played a major part in the development of the Baltic Exchange. As their prosperity grew, the prominent families moved out of the City westwards to Paddington, Bayswater, Notting Hill, and Holland Park. Towards the end of the 19th century they tended to assimilate themselves more and more with the British middle, and in some cases upper, classes.With the passing of time, education in British public schools distanced the younger generation from their Greek roots.

Shipowning developed side-by-side with commerce in the second half of the 19th century. The maritime connection has endured until the present day, though the nature of Greek commercial activities has changed and new families have come to prominence in the community. In the later 19th century a network of shipowner-traders from the Ionian islands (mainly Cephalonia and Ithaca) active in the Danube grain trade displaced the Chiots from their preeminent position. The leading new figure was Panaghis Vaglianos, a shipowner and trader who also played a central role in financing the development of the Greek merchant fleet. In the 20th century London maintained its position as a new generation from Chios, Andros, Kassos, and Oinoussai came to the fore and as the Greek fleet developed into the world's largest, specializing in dry bulk cargoes and, after World War II, in oil tankers also. The Greek shipowning community has endured and prospered because of the perceived benefits to Greek owners of keeping their offices or agencies in London, which include tax advantages and synergy with the City of London's services. Since 1936 it has been represented by the Greek Shipping Cooperation Committee, of which the president has been seen as the doyen of the Greek community, while the metropolitan archbishop of Thyateira and Great Britain is its spiritual leader.

A substantial community of Cypriots has also developed in Britain. From a modest number early in the 20th century, this grew rapidly through successive waves of emigration after World War II, in the early 1960s when Cyprus became a republic, and after the Turkish occupation of Northern Cyprus in 1974. The Greek Cypriot community, which may now number between 100,000 and 200,000, is mainly concentrated in north London, and is present also in Birmingham, Bristol, Manchester, Liverpool, and other British cities. It is active in the restaurant and clothing trades, in services, and in the professions.

Bulgaria

Greek colonization of the Bulgarian coast, part of the region known in antiquity as Thrace, began in the 7th century BC with Miletus leading the way. The main sites were Apollonia (modern Sozopolis), Odrysos (modern Varna), Anchialos (Pomorie), Krounoi (Balchik), Naulochus (Ozbar), and Mesembria (Nesebar). These cities led an unexciting if prosperous existence, trading wine and salt in exchange for grain and livestock. Philip of Macedon conquered the interior of Bulgaria and founded Philippopolis (modern Plovdiv) in 342 BC. Only his more powerful successors kept control of this area, and only some stubborn campaigning in 28 and 29 BC by Marcus Licinius Crassus, son of the triumvir, brought the

Roman frontier as far as the Danube. Thrace remained a client kingdom until the reign of the emperor Claudius (AD 41–54) when it was incorporated into the Roman empire. For the next 150 years the south-eastern part of Europe prospered. More cities were founded in the interior, and it is clear from the evidence of inscriptions that Greek rather than Latin was the lingua franca in most of Bulgaria except for the Danube frontier. Ovid, although actually writing about Tomis in Romania, gives a fair picture of the hybrid culture of the Roman era, well preserved in Bulgarian archaeological museums.

10. Bulgaria

Barbarian pressure on the Danube frontier began towards the end of the 2nd century AD in the reign of the emperor Marcus Aurelius (AD 161–80), although at the beginning of the century Trajan had advanced Roman power across the Danube into Dacia. From AD 200 to 600 there was endless pressure on this frontier. Many barbarians passed into the Roman empire. On the other hand Greek influence spread to new cities of the interior such as Marcianopolis, Diocletianopolis, Nicopolis ad Istrum, and Nicopolis ad Nestum. A fair portrait of life in some of these cities and Greek cities on the coast is given by the 4th-century historian Ammianus Marcellinus and the author of the *Historia Augusta*. In the 6th century the western Balkans were devastated by barbarian invasion, but imperial armies were still active in Bulgarian territory in close proximity to Constantinople.

Finally the Danube frontier collapsed in 602. This did little to affect the coastal cities, but the fragile Graeco-Roman culture in the interior collapsed. Serdica and Philippopolis held out until the 9th century, but then Sofia became a Bulgarian city, and Plovdiv went into a period of decline. After the attacks of tsar Simeon at the beginning of the 10th century even the Black Sea ports passed briefly under Bulgarian control, until the Byzantine revival at the end of the century brought the whole of the Balkans under imperial sway. Greek influence, however, remained largely confined to the coast. It was a commonplace of Greek ecclesiastical writers to complain of the primitive conditions in the interior, and Western travellers during the Crusades agreed on this point.

The rise of the second Bulgarian empire and the Fourth Crusade (1204) meant that Byzantium lost control of the Bulgarian interior for ever, and the coastal cities for a temporary period. Michael VIII Palaiologos recovered the latter during an extensive campaign in 1262, and curiously, in spite of temporary losses in Bulgarian, Greek, and Turkish raids, they remained as part of the empire until 1453. Under Ottoman rule the seaports continued to prosper. Great Byzantine names appear in the records of these towns. Michael Kantakouzenos's wealth is noted in the 16th century, although eventually he was executed by the sultan. Cossack raids in the 17th century damaged the towns, and the great monasteries of Sozopol were destroyed in 1629. Greek priests and merchants were a powerful force of Hellenism in the interior, although they never really penetrated the countryside. Plovdiv was settled extensively by Greek merchants, whose houses can still be seen, and in the south Melnik and Nevrokop, now Goce Delčev, were centres of Hellenism. At the beginning of the 19th century we find some collaboration between Bulgarian bands under such leaders as Dimitris Vakiotis and the Greek movement for independence. Since Greek schools were the only schools to provide education, even nationalist Bulgarian intellectuals derived inspiration from Greek models. The work of Dimitrios Darvaris (1751–1823) was influential in education and literature. Soon, however, Bulgarians began demanding their own schools, Church (gained in 1870), and an independent state (virtually gained in 1878 although full independence was not granted until 1908). Greek cities survived, either because, like Melnik, they were not even in 1878 a part of Bulgaria, or because, like the coastal ports, they were in a part of Bulgaria that involved a strange mixture of races, as for instance the Gagauz, Turkish-speaking Christians who often allied with the Greeks.

The Balkan Wars and World War I led to the hardening of frontiers. Greece and Bulgaria were on different sides in two of these wars, and the position of Greek speakers in Bulgaria became difficult. Accordingly in a series of well-documented population exchanges most of the Greek speakers left centres where Greek had been spoken for 2500 years in exchange for homes in Macedonia and western Thrace previously inhabited by Bulgarians. Some of the poorer inhabitants remained behind, and fairly rapidly became assimilated. It is still possible to find old people in Nesebar speaking Greek among themselves, and Nesebar, Goce Delčev, and Melnik look like Greek towns. In the census of 1965 there were more than 8000 inhabitants of Bulgaria speaking Greek, but the collapse of Communism has meant that many of these, like the 4500 Karakatchans also speaking Greek, emigrated to Greece.

Bulgars

The Bulgars were a non-Indo-European people originating in southern Russia. Under khan Asparuch (*c.*AD 650–*c.*700), one of many semi-legendary leaders of Bulgaria, they reached and crossed the Danube. In AD 681 the emperor Constantine IV was forced to recognize a Bulgarian kingdom north of the Haemus mountains. By this time most of the Balkans had been penetrated by the Slavs, and in the next 100 years Bulgaria took control of these Slav settlements, depriving them of their non-Indo-European identity in the process. A Byzantine revival in the 9th century was halted by khan Krum, who in 811 defeated and slew the emperor Nikephoros I. By this time the Bulgarian realm stretched over much of northern Greece and threatened Constantinople, which Krum attacked.

Krum's successor, Omurtag, made peace with Byzantium. He was the last ruler with a non-Slavonic name. His grandson Boris was converted to Christianity, but Bulgaria still remained a thorn in the side of the Byzantine empire. Boris's son Simeon, although or because he had been brought up in Constantinople, harboured ambitions to succeed to the Byzantine throne. He was known as "the half-Greek", and introduced Greek culture to Bulgaria. He defeated the Byzantines decisively in 917, but his successors Peter and Boris II were faced with internal dissension, threats from Russia, and a renascent Byzantium which under John I Tzimiskes (969–76) overran the eastern half of Bulgaria. In west Bulgaria there was a last Bulgarian revival under tsar Samuel, who kept the Byzantines at bay until 1014 when he was decisively defeated by them under the appropriately named Basil Bulgaroktonos (Bulgar Slayer).

The centre of Samuel's empire was around lakes Ohrid and Prespa, but he had at times ruled as far west as the Adriatic and as far south as Thessaly. His racial origins are obscure, and it has been claimed that he was Macedonian rather than Bulgarian. All that he ruled passed under Byzantine control and remained so for more than 150 years, although there were

sporadic revolts. In 1185 two local chieftains in the Haemus mountains rose up in protest against extortionate taxes. The enfeebled Byzantine empire was in no position to suppress this revolt, and Asen's brother Kalojan was able to take advantage of the Fourth Crusade (1204) to establish a strong Bulgarian state that was never again to acknowledge Byzantine rule. Tsar Asen II from 1218 to 1241 ruled over a kingdom that stretched from the Black Sea to the Adriatic, a kingdom almost as large as that of Samuel. As with Samuel there is some doubt about the racial origin of the Asenids, since Byzantine sources frequently refer to them as Vlachs. The narrow chauvinism of modern historians cannot obscure the fact that both Bulgarian empires were multi-ethnic states.

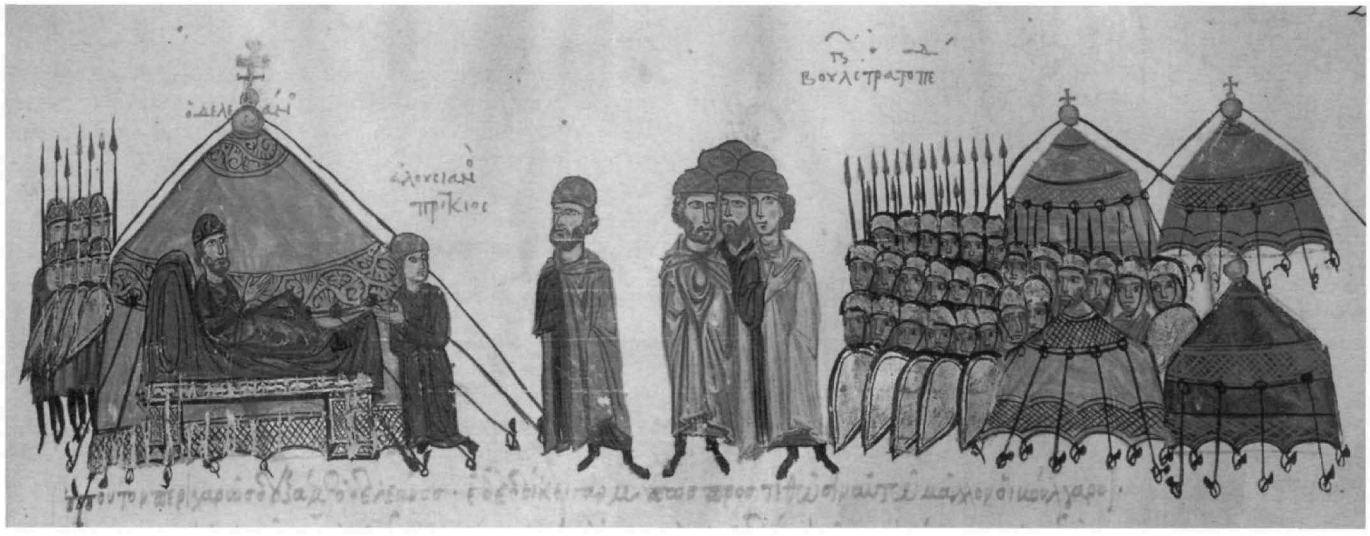
After a brief period when it was the principal power in the Balkans the second Bulgarian empire rapidly declined. There was an invasion by the Tatars, internal dissension, and a revival of Byzantine power under the Palaiologoi. The Bulgarians were no match for the growing power of the Serbs, who defeated them decisively at Kyustendil in 1341, and an enfeebled and divided kingdom rapidly fell a victim to the Ottomans who were to rule over Bulgaria for 500 years. Oddly, the disastrous 14th century saw a revival in Bulgarian art and literature, inspired by Byzantine models.

There were some spasmodic revolts against Turkish authority, but on the whole Bulgarian resistance was tame. A number of Bulgarians were converted to Islam; a number of Turks settled in Bulgaria. The Bulgarian Church was subordinated to the patriarchate at Constantinople, and Greek priests discouraged Bulgarian patriotism and the use of the Bulgarian language. By the 1840s, however, Bulgarian schools were being founded and Russian support fostered Bulgarian nationalism. Surprisingly many early Bulgarian leaders received their education in Greece. Relations between Bulgaria and Greece deteriorated sharply in 1870 when the Turkish authorities allowed a separate Bulgarian Church, known as the Exarchate. For the next 50 years Patriarchists supporting the Greek Church and Exarchists supporting the Bulgarian Church fought with each other, sometimes literally, for the allegiance of the inhabitants of the central Balkans, while simultaneously fighting for independence from the Turks. In 1878 after some particularly brutal massacres of Bulgarians a limited form of independence was granted to Bulgaria at the treaty of Berlin; the earlier treaty of San Stefano in the same year had given a much greater area to Bulgaria, but between 1878 and 1912 there was still a large area of Turkish territory disputed between the Exarchists and the Patriarchists.

This dispute was eventually settled by the Balkan Wars. In 1912 Greek, Serbian, and Bulgarian armies invaded Turkish territory. While the Serbs advanced as far as Bitola and the Greek army arrived at Thessalonica just before the Bulgarians, the main brunt of the fighting was borne by the Bulgarians in Thrace with little in the way of territorial gains. It looked as if the combatants were going to be rewarded with what their armies had gained. Enraged by this, the Bulgarians started the Second Balkan War in 1913. This they lost, and they lost more territory as a result. Western Thrace, largely inhabited by Muslims with some Greeks in the towns, became Bulgarian briefly, but the bulk of Macedonia was divided between Serbia and Greece, although generally inhabited by a people speaking a language very like Bulgarian. In World War I Bulgaria was again on the losing side and lost western Thrace to Greece in the subsequent peace treaty.

Not surprisingly, as the enemy in the guerrilla wars since 1880, and the enemy in the Second Balkan War and World War I, Bulgarians were not popular with Greeks. There was a nasty border incident near Petrič in 1925. Attempts under the aegis of France to achieve an alliance of Balkan states foundered when Bulgaria joined the Axis and was rewarded with most of Yugoslav Macedonia and western Thrace for its pains. Bulgarian rule over this territory was not successful, especially in Greece, where most of the Bulgarian population had left as a result of some well-managed population exchanges.

In 1944 Bulgaria deserted Germany and joined Russia. For Greece, which had first resisted the Axis and then fought a civil war against the communists, the Bulgarians remained enemies. The frontier was tightly guarded, and diplomatic relations remained frosty. The end of the Cold War and common coldness to the emergence of the Former Yugoslav Republic of Macedonia as an independent state meant a slight reduction of tension, although the economic instability of the new Bulgaria



Bulgars: illustration from the 11th-century chronicle of Skylitzes showing the Bulgar leader Peter Deljan in his tent during his siege of Thessalonica in 1040, Biblioteca Nacional, Madrid

and the presence of a large Muslim minority still aroused suspicion. In fact Bulgaria and Greece have much in common, sharing a Byzantine heritage, Eastern Orthodoxy, and a tradition of resistance against the Turks. But old enmities die hard.

T.J. WINNIFRITH

Summary

A non-Indo-European people from southern Russia, the Bulgars moved westwards at the same time as the Huns and Avars. In 681 they crossed the Danube and forced Byzantium to recognize a Bulgarian kingdom. At times this kingdom stretched from the Black Sea to the Adriatic. The Bulgars rapidly assimilated with the Slavs and by the 9th century ceased to be a separate ethnic group.

Bureaucracy

For most of antiquity, Greece remained a series of separate states, often in conflict. Hence, tracing patterns of bureaucracy is a difficult process at best. The Greek city states required administrative machinery to coordinate and produce documents, collect taxes, preside over laws, and maintain order. As a result, the development of a bureaucracy, or a core of professionals dedicated to the minutiae of state administration, became a requisite in nearly every state. City states developed similar patterns of administration. Increased efficiency, accompanied by advances in travel, produced government reforms on every level in almost every state. Greece was the first civilization effectively to develop a bureaucracy that incorporated those members of society who fulfilled the qualities of servitude and learning required to meet the needs of its citizens.

The duties of administration, responsibilities for the execution of those duties, and those permitted to function as part of the administration varied from state to state and period to period. Membership in many organizations was limited, by definition, to citizens. Affairs of the state and benefits that accompanied civil service were restricted to individuals belonging to a socially accepted group. Hereditary affiliation was the only means of inclusion within ancient Greek society. In some regions, however, slaves were employed for labour-intensive functions such as recording. Differences between the staffing of local governments were not important, however, since the benefits of government went to its citizens and to no one else.

The establishment of a bureaucracy indicated the creation of an institution that outlived its specific function. Although they varied by time and location, ancient Greek society became dependent upon the services provided by civil servants. The bureaucratic framework relied on flexibility to meet evolving demands in a changing society. In its most basic sense, the bureaucracy facilitated distribution of obligations and benefits that accompanied citizenship. Through this distribution, Greek administrators promoted equity among the population and governmental advantage. The result of the Greek bureaucratic system was a society increasingly tied to local rule, and a general feeling of benevolence between government and citizen.

During the Archaic period public authority lacked direction and effectiveness. Evidence for this is found in Homer's *Odyssey*. City-state governments in this period failed to convene for decades. Citizenship indicated eligibility for public service, and, in return, society expected career terms of service from those elected. Other than the central composition of the government, usually a king, a council, and an assembly, little else is known about the daily functions of the government or its administration during the 8th century BC. With the limited number of persons involved in ruling a city state, there is likely to have been little interaction between ruler and subject, and little mutual concern.

Following the Archaic period, two events indicate the improbability of an established Greek bureaucracy. First, accounts of the Seven against Thebes suggest that the requisite conditions for a coalition – primarily an established bureaucracy – were missing. Second, Athenian intervention in the affairs of Miletus in 450 BC and Samos in 442 BC was limited to physical and not political domination. Athens lacked the required administrators to promote its policies and intentions. In both cases, Greece lacked the tools to capitalize on the success of its military campaigns.

Evolving through the ages of monarchy, aristocracy, and tyranny, three periods void of successful bureaucratic systems, democratic reforms in government produced similar changes in administration. Magistrates became crucial figures in most societies. Civil servants were elected annually and were not ordinarily eligible for reelection. Cities and states were administered by those professional civil servants who possessed no real power, but dedicated themselves to the execution of their duties. In any given city state, hundreds, even thousands of magistrates' positions existed, allowing a civil servant the opportunity to serve in several positions simultaneously without repeating a post assignment. Lower magistrates received a state-provided salary, while higher-ranking officials often came from wealthy families, demanding no compensation. It was during the 2nd century BC that magistrates achieved prominence within Greek society, and a permanent, professional core of civil servants was established.

By the 3rd century BC Greek bureaucratic reform produced more widespread and tangible results. In Thrace king Seuthes III organized the country on a Hellenistic model. He divided his kingdom into towns, provinces, and regions. At the lower levels local rule provided direction for daily government functions, while a smaller percentage of natives participated at the higher levels. Each level took direction from higher authorities, while preserving the appearance of self-rule.

In Egypt Hellenistic rulers inherited a bureaucracy many centuries old. Different from the civil servants that perpetuated the daily activities of the Greek city state, Egyptian bureaucrats often performed their scribal or accounting duties for their entire lives. Scribes were often illiterate, transferring the symbols from one sheet to the next, failing to understand their

significance. Accountants, who could perform basic arithmetic, were likewise illiterate, and ignorant of their greater significance within society. Trained to serve the pharaohs, Egyptian civil servants introduced a new standard of detail to administrative duties. The success of the Egyptian bureaucratic model prior to the Greeks is questionable, since few civil servants recognized their job significance or benefited from their selfless service. During the period of Greek rule an abundance of trained civil servants, both native and imported, permitted the division of Egypt into cantons, districts, and villages that could be extraordinarily well controlled. Traditionally, Greek civil servants filled higher posts in the empire than their native counterparts. Accountability throughout Egypt achieved unparalleled proportions during the 3rd century BC.

The Ptolemaic kingdom was the most effective political organization to emerge from the Greek-speaking world. The constitution of the empire provided the basis for unequalled administrative success. The Ptolemies oversaw the Macedonian-Greek upper class and the Egyptian fellahin, a group dedicated to the patient and meticulous work of serving the pharaohs. Rather than replace the Egyptian bureaucratic system, the first two Ptolemies opted to augment the existing system with Greek reforms. The combination of a disciplined workforce and efficient administration produced the most effective government of the ancient world. Reforms in government administration and accountability in Ptolemaic Egypt provided the standard by which bureaucracies would be measured for decades. It was also during the 3rd century BC that bureaucratic service became not only an acceptable profession for the upper class, but an enviable one.

During the 2nd century BC Greek bureaucratic reforms were introduced throughout the eastern and western empires. Mithridates I emulated the Greek system, and employed Greek civil servants in large numbers. Iranian leadership instituted Greek reforms at the local level, and evidence of Greek bureaucratic influence appeared as far away as Kurdistan and India. The Greek model provided the basis for efficient administration of empires that continued to grow in size and complexity. By emphasizing self-rule, central governments freed themselves of the tedium associated with accounting and recording at the local level. The division of empires into subordinate organizations increased accountability and ensured the communication of supreme mandates.

Few changes occurred in Greek bureaucracy following antiquity. The Greek administrative model spread widely, appearing as the basis for the Roman system of administration, defining the Byzantine model of government, and finding great favour centuries later in the courts of Europe. Kingdoms in both east and west assimilated patterns of Greek government in their expanding and contracting empires.

Byzantium refined the Greek bureaucratic model. Gradually, a system of centrally controlled, self-governing institutions took shape. Although native-born inhabitants enjoyed the privileges of citizenship, the civil service provided an avenue towards acceptance and social mobility not previously available. Competition for bureaucratic positions improved the quality of candidates and their subsequent performance. Education eventually became the prerequisite for service, replacing citizenship in significance. Two distinct career paths guided bureaucrats, and provided nearly unlimited potential for advancement. Civil servants specialized in finance or clerical careers. Both positions required literacy and advanced education. Similar to the ancient model, post holders were appointed or elected for a year, but the number of posts available in any given location allowed for civil servants to serve in many at one time. Bureaucratic positions occurred from the lowest to the highest levels of government, promising advancement for the most competent within a career field.

The chief institution within Byzantium was the commune. An established commune was a legal entity of one or several towns, providing self-direction, but enjoying the toleration of the administration. The *Kununname* was the first handbook to standardize and regulate the duties, responsibilities, and progressions of the bureaucrat. It facilitated efficient local rule, without extensive oversight from the central government. The *Kununname* further delineated two distinct career paths: accounting and clerical careers. Accountants levied and dispersed taxes at a local level, giving those who filled such a position great importance. Clerks not only performed as recorders, but also convened and presided over legal disputes. For the non-citizen, the authority and respect that accompanied civil service could not be found in any other career. As a result of Byzantine reforms, the world recognized the significant contributions of civil servants and welcomed their contributions, even in the most restricted societies.

During the period of Ottoman rule, Greek bureaucracy took a backward step. Plagued by a system of paternalism, government inefficiency reached a level not previously experienced. Local magistrates were exceptionally corrupt and appointed for long periods of time. Few local offices existed to address the needs of the population, while taxes increasingly supported programmes outside the community. Gradual erosion of the once effective Greek bureaucratic model resulted in a government incapable of the most basic administrative functions. Unable to recognize the limitations paternalism placed on the efficiency of the civil service, the Ottoman government failed in its ability to manage or administer its empire. It was during the period prior to the 19th century that Greek government at every level achieved new lows.

In terms of both national identity and social direction, Greece experienced great changes prior to the 19th century. As a consequence of Greek exposure to European nationalism, Ottoman practices seemed inadequate for a changing society. Shifting trends in the 19th century favoured western law codes, administrative processes, and a general return to effective government. The effort to redistribute both the wealth and the lands of those who had ruled Greece required an administrative system that promoted equity, similar to that of the Archaic period. For a brief period of time in the 19th century Greek paternalism or appointment through favour guided the assignment of civil servants. Paternalism resulted from exposure to European governments as well as the lingering effects of Ottoman rule. This policy proved ineffective in Greece as in most other European nations by the 20th century, giving rise to appointment by merit. This trend continues today. The modern Greek civil service requires strong skills in administration, diversity of character and talent, and dedication to advancing the goals of both the state and the citizens.

In antiquity Greece produced a significant and lasting model for bureaucratic efficiency. This Greek model effectively

guided operations at every level of government, and succeeded in administering an empire that encompassed divergent cultures and concerns. Elements of Hellenistic bureaucracy survive in nearly every major government in the world today, a tribute to the vision of the early Greek thinkers.

Burial Practices

The earliest burials in Greece date from the Mesolithic period (8th millennium BC). In the cave of Franchthi (Argolid) were found the undisturbed inhumation of a young man and several disturbed burials, together with two cremations thought to be the earliest in Europe. There are many more instances of Neolithic burials (5th–4th millennia BC). The standard practice was primary inhumation in pits, though secondary inhumation (after the body had been exposed or provisionally buried until the flesh had disintegrated) and cremation are also attested. Formal cemeteries are first found in the Late Neolithic (Kephala on Keos), but are not common, or indeed large, before the Early Bronze Age (3rd millennium BC), in the Cyclades and Attica; from then on, the practice of burying the dead within the house is mainly restricted to children. Monumental tombs for multiple burials (family, clan, or tribe) appear for the first time in the Early Bronze Age, but only in small numbers and certain areas (e.g. Leucas and Crete). Grave goods, which in the Neolithic were limited to simple pots, stone tools, or jewellery, become much more varied and reflect the socioeconomic differences in the community, the wealthy graves containing bronze weapons, clay and stone vases, gold and silver jewellery, and figurines of clay or marble. There is some evidence of ritual at the grave: vessels deposited on top of the grave, libations poured to the dead, and the ritual drink or "toasting" the dead, a custom better known from the Mycenaean period.

At the time of the first Minoan palaces (2000–1700 BC), the burial practices in Crete continue mostly unchanged, though jars (pithoi) or coffins (*larnakes*) were used more frequently. On the less prosperous mainland, burials were usually made within the settlements, in pits, stone cists, or in *pithoi*, and were scantily furnished with grave goods. Burying under tumuli, the only form of communal burial in this period, was an aristocratic practice, possibly restricted to particular tribes or clans, and largely confined to Messenia.

The Mycenaean period (1600–1100 BC) saw the change to the advice of multiple burial. Primary inhumation in family tombs became the norm. Single burials were uncommon and cremation an exception before the end of the period. The monumentality of the grave, the elaboration of the burial rites, and the quality and quantity of grave goods varied in relation to the status and wealth of the deceased in what was now a highly differentiated society. The earliest aristocratic cemeteries, Grave Circles A and B at Mycenae (1650–1550 BC), were circular stone enclosures, containing the graves of men, women, and children. The later, and richer, graves were deep shafts in which a number of dead were laid, and lavishly adorned with gold, including death masks for some of the men, headbands and shrouds decorated with gold discs for the women. Men were also provided with many weapons, and with drinking cups of precious metals, and women with gold jewellery. Later princely tombs were mostly of the tholos (beehive) type with corbelled vaults. The most monumental tholos tombs were built at Mycenae in the 14th and 13th centuries BC. Aristocratic funerals seem to have been lavish affairs, with funeral processions to the grave, the dead on horse-drawn chariots, the consumption of funeral meals, and the sacrifice of animals, sometimes even horses. Commoners were buried in larger cemeteries and simpler tombs dug in the rock, with a passage leading to a chamber (chamber tombs). Here multiple burials were often made over a period of several generations; earlier burials were pushed aside to make room for new burials after the flesh of the dead had disintegrated.

The so-called Dark Age (*c.*1200–700 BC) witnessed the reversion to single inhumation, in pit- or cist-graves. This is now believed to have been the result of the depopulation and fragmentation of society which followed the destruction of the Mycenaean centres, rather than of the arrival of newcomers. Only in some regions (Crete and to a lesser extent Messenia and Thessaly) was multiple burial in chamber or tholos tombs retained. During the Protogeometric and early Geometric periods (1050–800 BC) Attica and a few other regions (especially Crete) adopted cremation to the exclusion of inhumation, particularly for adults, children being mostly inhumed. But in the 8th century inhumation made a full comeback in Athens, and for the rest of antiquity the two rites then coexisted, though there were differences from region to region and period to period, cremation being more common than inhumation for adults in the Archaic period (7th–6th centuries BC), inhumation more popular in the Hellenistic period (4th–1st centuries BC). The two practices were a matter of choice and not of status or wealth. Inhumation graves were normally single burials, in simple shafts or pits, sometimes lined with stones or covered with tiles, or in containers such as sarcophagi, clay tubs, or pots (particularly for children). Cremation burials were normally placed in urns of clay or metal, which were often placed in lidded stone boxes. The graves were surmounted by mounds (tumuli) and often by grave markers. In the Archaic period the mounds were large and the grave markers could be tall sculptured gravestones or even over-lifesized statues (*kouroi*). In the Classical period, the age of democracy, laws were passed at intervals to curb the ostentatious display of wealth and to control the expense of

funerals, and so the mounds, judging certainly from representations on vases, were much smaller, while in Athens at least sculptured stone grave markers seem to have gone out of fashion for most of the 5th century. Family plots and *peribolos* (precint) tombs (tombs built of bricks or stones above the family plot) were used in Athens in the Classical period, but the grander type of built tomb was forbidden soon after its introduction in the late 5th century BC. Impressive examples of such tombs, with temple-like facades and sometimes vaulted and richly painted interiors, were built by the Macedonian kings and aristocracy from the 4th century BC onwards. They display a monumentality and wealth of grave goods (witness the unlooted tombs of Vergina) not found since the Mycenaean period.

The ancient Greek funeral as a three-staged process was already established by the time of Homer. The laying in state of the dead, or *prothesis*, most likely took place in the courtyard of the house after the ritual washing of the corpse by the women of the household. The dead was laid on a bier, wrapped in a shroud (or wedding dress in the case of unmarried or recently married women), the head supported by pillows and adorned with a crown. An important part of the *prothesis* was the mourning and singing of dirges, both formal (*threnoi*), sung by professional mourners, and improvised (*gooi*), sung by friends and members of the family. During the *ekphora* the dead was taken to the place of burial, on a horse- or mule-drawn cart (though Geometric representations, in keeping with heroic ideals, show chariots), and accompanied by a procession of mourners and sometimes a pipe-player. Less is known about the third stage, or deposition: a libation of wine was made to the dead, grave goods (personal belongings: strigils, mirrors, jewellery, toys, or vases) were placed in the grave or in special offering places or ditches nearby. Ceremonies were held during which burnt remnants of food, including the bones of small animals or birds, were also deposited. After the funeral, a funerary banquet (*perideipnon*) in honour of the deceased was held in the deceased's house. In the days and weeks which followed, libations and offerings were made at the grave by relatives of the deceased, particularly the women. Special rituals were the *trita* (third-day rituals), *enata* (ninth-day), and *triakostia* (thirtieth-day). Subsequently rituals were held to mark the annual anniversary or special occasions.

Funerary customs did not substantially change during the Hellenistic and Roman periods, though the graves are generally poorly furnished (the most common offering is the fusiform *unguentarium*, a container for ointment). The spread of Christianity naturally had repercussions on funerary practices. One important change was the disappearance of cremation. During the Byzantine period the dead continued to be buried in single graves, though these were now usually located in graveyards adjacent to, or inside, churches and chapels. The graves themselves were cists made of stone or brick, and marked with a grave slab with a cross on it, or with an actual cross. However the earlier custom of including vases and other objects, and even the coin which had previously been intended for paying the ferryman Charon, is found in Byzantine graves, and reflects the continuity of the pagan custom of providing for the passage from life to death.

In contemporary Greece the funerary customs are a mixture of Christian practices and long-standing traditions, which have many analogies with those of antiquity. In the cities, where the undertakers are responsible for the organization of the funeral and other rites, many of the traditions have been lost, but they are still observed in rural Greece. In many villages the dead is laid out on a bed at home, while relatives and friends mourn and sing laments before the dead is taken to church for the funeral. These laments (*moirologhia*), which are part of the Greek oral tradition and a survival of the ancient *gooi*, are also sung by women during the funerary procession and at the deposition. The priest presides at the formal funerary service in church, and recites prayers for the forgiveness of the sins of the deceased (the *trisagio*) at home and at the graveyard. A coffin of metal, wood, or concrete is normally used, and a cross or, if it can be afforded, a monument of marble is later erected above the grave. Food is brought to the graveyard at the funeral and on all later occasions when rites are performed. Indispensable are the *kollyva*, consisting of boiled wheat with spices and raisins decorated with icing sugar and silver sweets. Rites are held at the grave at prescribed days after the death of a person. The dates (the third, ninth, and most importantly the fortieth) are connected with the stages in Christ's progress between his death and the Ascension, but they closely correspond to ancient practices. The last important rite to be performed at the grave is the exhumation of the bones of the deceased, which usually takes place three to seven years after burial, by which time the flesh has disintegrated completely. This practice, which has connections with the prehistoric custom of secondary burial, marks the integration of the deceased into the world of the dead and the end of the obligations of the living to the dead. The exhumed bones are placed either in designated areas in the churchyard or in ossuaries, or else they are reburied beside the original grave. In the villages the rite is usually carried out by the women and provides the last occasion for mourning, the singing of *moirologhia*, and the sharing of *kollyva*.

Byron, George Gordon, Lord 1788–1824

Poet and philhellene

"While every man of any pretensions to learning" is tiring himself out studying "the harangues of the Athenian demagogues in favour of freedom, the real or supposed descendants of these sturdy republicans are left to the actual tyranny of their masters, although a very slight effort is required to strike off their chains." Byron's remark occurs in a note, written towards the end of his time in Greece and Turkey in 1809–11, to his *Childe Harold's Pilgrimage*, canto 2 (1812). This work (one of the most popular poems of the 19th century), and the series of eastern tales beginning with *The Giaour* (1813), had a profound influence on European and American philhellenism in the years just before the outbreak of the Greek War of Independence in 1821; subsequently the poet's own death while attempting to help strike off the chains in 1823–24 had even greater impact.

Childe Harold is neither actively hostile to ancient Greece – there are meditations at Marathon, Sunium, and the like – nor invariably favourable to modern Greece: Byron sometimes gives voice to the common contemporary belief that modern Greeks are degenerate, unworthy to inhabit the "land of lost gods and godlike men". But there is an unusual degree of interest in such "lands scarce noticed in historic tales" as the domains of Ali Pasha in Epirus and Albania, and it is clear that on balance he is sympathetic to a people whose ungodlike nature he regarded, more than most, as an unsurprising consequence of centuries of Turkish oppression. The poet engages closely enough with these moderns to go to the unusual lengths of learning "the Romaic or Modern Greek language", the appendix on which in *Childe Harold* includes the *Battle Hymn* (1797) of Rigas of Velestino, "who perished in the attempt to revolutionize Greece". Byron's close engagement with the Greeks prompts both sympathetic sentiment and a desire to inform; *Childe Harold* combines "exoticism with a sense of history and of place and a responsiveness to contemporary political realities" (Webb, 1993).

Byron's continuing philhellenic reputation was also enhanced by his disapproval, expressed in both the *Childe Harold* canto and *The Curse of Minerva* (1812), of Lord Elgin's removal of the Parthenon frieze, and his provision, in *Don Juan*, cantos 2 and 3 (1819), of both a sympathetic modern Greek heroine, Haidée (speaker of "good modern Greek / With an Ionian accent, low and sweet"), and a song that, taken out of its partly ironic context, became one of the anthems of philhellenism: "The isles of Greece, the isles of Greece! / Where burning Sappho loved and sung...".

Byron, who was sympathetic to liberal causes including that of the Italian *carbonari*, took some interest in the Greek War of Independence from its inception. He became more involved once the London Greek Committee approached him in April 1823. Edward Blaquiere, an Irish supporter of Greek independence, encouraged him on behalf of the committee to lend his aid in "resuscitating the land already so well illustrated by your sublime and energetic muse", and he was made a member in May. His departure for Greece was also a response to personal imperatives including a desire to do great deeds instead of writing poems, perhaps to improve his reputation at home, and to escape from his relationship with Teresa Guiccioli.

Having raised as much money as possible, Byron set off from Genoa in July. He went to Cephalonia, where the British resident, colonel Charles Napier, was both well disposed to the Greek cause and among those best able to brief his visitor on the complex internal divisions among the Greek leaders (a state of affairs little known to or idealistically ignored by the committee). Anxious about the implications of supporting or appearing to support a particular faction or grouping, Byron stayed in Cephalonia until late December. Finally in January 1824 he moved to Missolonghi, headquarters of prince Alexandros Mavrokordatos, although he attempted not to become too closely identified with him. Byron's time here was mostly difficult and unhappy – he was besieged in person or by letter by Greeks of every faction seeking money, attempted to pacify quarrelsome foreign volunteers, had difficulties in controlling the hundreds of unruly Suliotes and Albanians whom he for a time employed, and was irritated and confined by the persistent rain which made the already naturally damp Missolonghi "a mud-basket". Military supplies from the London Greek Committee were slow in coming and inadequate or unsuitable when they did arrive, and its promised loan, which Byron was to have administered, was not finalized until just before his death. Not surprisingly, he was less unambiguously committed to the cause than pious legend would have it; he stopped keeping a journal because he "could not help abusing the Greeks in it". But he was determined to honour his word, and expressed loyalty to newly awoken Greece and a heroic determination to seek "A Soldier's Grave" in one of his last poems, "On This Day I Complete My Thirty-Sixth Year". (The Byron myth has often stressed this aspect of the poem rather than its explicit origin as a reaction to unrequited love, particularly perhaps since the love was for a Greek boy, Loukas Chalandritsanos.) The loyalty was preserved inviolate by his death (from fever exacerbated by excessive medical bleeding) in April 1824. This was probably more useful to the Greek cause than anything Byron could have achieved while living.

He became immediately a martyr in the cause of liberty, saluted in a stirring funeral oration by Spiridion Trikoupis (itself an influence on subsequent tributes in verse), with solemn mourning and cannon shots in Missolonghi, and then with a national day of mourning. Through the 19th and early 20th century and beyond statues designed to stress his heroic qualities proliferated, and streets and children were named after him. (The best-known statue, of Byron and Greece in the Zappeion gardens in Athens, dates from 1896.) He was mourned in klephtic ballads, by Dionysios Solomos in his *Lyrical Poem on the Death of Lord Byron* (unpublished until after Solomos's death in 1857 but later influential), by Andreas Kalvos in "The Britannic Muse" (1826); later the academic poet Alexandros Soutsos, the popular poet Achilleus Paraschos, and many others continued to proclaim Byron's glorious sacrifice; there was a fresh rush of poetry to mark the centenary of his death in 1924, and he was the subject of plays by Alekos Lidorikis (1934) and Manolis Skouloudis (1964).

Interest in the hero's life led to some interest in his poems, most of which were available in translation from the 1850s. Solomos's *Hymn to Liberty* (1825), begun in 1823, echoes the

Lord Byron: statue at Missolonghi, erected in 1881, with the poet's heart buried beneath

"Isles of Greece" song – where the breasts of Byron's pre-rebellion Greek maidens must one day "suckle slaves", those of Solomos's maidens will suckle "courage and freedom" – and much 19th-century Greek poetry is more generally "Byronic". As late as 1912 Kostis Palamas (in "Pegasus") asserts that Pegasus has been riderless since Byron's death and only now does a Greek poet make bold to mount in his place. Nevertheless, in Greece as to some extent elsewhere, his life as mythically constructed since Missolonghi has remained much better known than his work or his actually more complex attitude to the Greeks.

MARTIN GARRETT

Biography

Born in London in 1788, Byron was educated at Harrow and Trinity College, Cambridge. He visited Greece and Turkey in 1809–11 after which (in 1812) he published the first two cantos of *Childe Harold's Pilgrimage*. Its lament on the bondage of Greece had a profound effect on European and American philhellenism. Byron himself sailed for Greece in 1823 and died of fever at Missolonghi in 1824.

Byzantine Period, Early 330–843

In AD 324 Constantine the Great became sole ruler of a Roman empire that could still claim its territorial integrity. It was at this time that he took the momentous decision to build a new city on the shores of the Bosporus, on the site of ancient Byzantium. Constantine's city, Constantinople, was soon to be known as the "New Rome", and, although not designated at first to be the capital of the empire, it was to become so. Constantinople was positioned in close proximity to centres of Hellenistic culture; in time, and under Christian influence, it became the focal point and representative of the Christian Byzantine empire as Rome had been of the earlier pagan civilization of the Mediterranean.

The Christian author Sozomen relates how Constantine, after a long search for a suitable site for his city, was told in a dream to abandon his plan to build on the ruins of what was believed to be the legendary Troy, and consequently decided to raise his city on the ruins of Byzantium (Sozomen, *Historia Ecclesiastica*, 2. 3). Christian legend later told the story that when founding "New Rome" Constantine walked a great distance outlining the circumference of his city until those who accompanied him asked in wonderment: "How long, our Lord, will you keep going?" He reportedly replied: "I shall keep on until he who walks ahead of me will stop" (Philostorgius, *Historia Ecclesiastica*, 2. 9).

It was thus believed that Constantinople had been situated on the shores of the Bosporus on the site of Byzantium, the ancient colony of the Megarians, by divine intervention. The city commanded the entrances to the Black and the Mediterranean seas, and was placed on the border of two continents: Europe and Asia. The ancients had considered this location so advantageous that the Greek historian Herodotus told how the Persian general Megabazus, on arriving at Byzantium, called the inhabitants of the opposite shore at Chalcedon a blind people for having failed to build their colony on the better site, which was soon after occupied by the Megarians (Herodotus, 4. 1–44).

Constantine ordered materials to be brought from everywhere in the Roman empire, and pagan works of art were requisitioned by his agents and shipped to Constantinople from major imperial cities. The emperor's new city was dedicated on 11 May 330 with celebrations that lasted for 40 days. In order to protect his creation, Constantine surrounded the city with a wall that reached from the Golden Horn to the Sea of Marmora.

An insufficient number of monuments and buildings have survived the ravages of time to give us evidence of what the city must have looked like in the days of its founder. The church of St Irene, however, although rebuilt twice, during the reigns of Justinian the Great (527–65) and Leo III (716–41), dates back to the time of the first Christian emperor, and is preserved to this day. Of the pagan monuments brought to Constantinople, the famous serpent column from Delphi, given to the sanctuary of Apollo in commemoration of the Battle of Plataea, can still be seen in Istanbul today.

Not only architecture but Christian literature flourished under Constantine. The bishop Eusebius, the "father of ecclesiastical history", lived into the early 4th century and is the principal authority on Constantine the Great. His main work,

the *Ecclesiastical History*, covers the time span from Christ to 324, when a victorious Constantine became sole ruler of the empire. The *History* is one of the most important sources for early Christianity, containing a wealth of documentary data. It is the first Church history to have been written, and thus sets the tone for later historians of Christianity. The spurious *Vita Constantina*, if written by Eusebius at all, is a panegyric rather than a history of the life of the emperor. The work of Eusebius was later continued by Socrates, Sozomen, Theodoret, and the Arian Philostorgius.

The intellectual life of the empire in this period was particularly rich and vigorous in Egypt, and especially so in Alexandria. Synesius of Cyrene, a scion of an old pagan family, began as a Neoplatonist but ended his life as the bishop of Ptolemaïs. Regardless of this, his sentiments remained coloured by his pagan past. Although not a historian, his work contains much that is of historical interest; but it is mostly as a stylist that Synesius set a standard that was much admired and copied by later writers. Athanasius, bishop of Alexandria, devoted his work to theological disputes during the long conflict with Arianism. In addition, he wrote a *Life of St Antony* in celebration of the founder of monasticism. He was followed by Palladius who, writing under the influence of Athanasius, presented in his work the ideal of the ascetic life. Cyril, another bishop of Alexandria, wrote letters and sermons that were no stylistic masterpieces since, by his own admission, he lacked a rhetorical education. Clearly, such training was still considered the cornerstone of the education of the elite.

An interesting woman whose impressive erudition stands out against the background of the savants of early Christianity is Hypatia, who lived in the early 5th century. The daughter of an Alexandrian mathematician, and a woman of great beauty, she became a philosopher in her own right. Alas the learned lady was finally killed by a fanatical crowd in Alexandria.

When Constantine died in 337, he left to his heirs an empire that once more had a well- established currency in the splendid *solidus* (*nomisma*), a gold coin that was to retain its value, and the respect it commanded throughout the Mediterranean world and beyond, for almost 700 years. The army that he had led so successfully in many battles was devoted to the house of Constantine, and, given the Achilles heel of an uncertain succession, it insisted that only the three living sons of the emperor could rule. This led to the massacre of all the other relatives of Constantine except for two very young boys, his nephews Gallus and Julian.

The three sons who followed him, Constantine, Constans, and Constantius, shared a combined reign from 337 to 340. With his brothers eliminated in 340 and 350 respectively after a period of conflict, Constantius became sole ruler of the empire for the rest of his reign. For lack of an heir, Constantius made his cousin, Julian, Caesar in 335. In 361 Julian's troops declared him emperor. Civil war was barely avoided when on his deathbed Constantius magnanimously designated Julian as his successor.

Julian (361–63), known as the "Apostate", had a brief reign during which he tried to bring back pagan worship. In his youth, when he was virtually an exile, he had cultivated the study of philosophy and, although baptized, loathed the Christian religion. Julian was a brilliant intellectual who was at home in various genres of literature: orations, letters, and satire. His satirical work, the *Misopogon*, is an important biographical source for the emperor's life. He met an early death when he invaded Persia at the head of his armies. Subsequent rumours told that he had been struck down by a Christian among his own soldiers. Christianity had won the day, and the reign of Julian can be seen as a failed attempt to turn back the clock.

The empire faced troubled times as a result of both the renewed barbarian invasions and the calamitous Battle of Adrianople (378), in which the emperor Valens lost his life, and after which Gothic forces overran imperial territory. It was for reasons of such dangers that the emperor Gratian raised to the throne as co-emperor Theodosius, an able general who, on account of a conspiracy against his father that led to the latter's execution, had lived in exile in Spain. To satisfy dynastic sensibilities, Theodosius married Gratian's half-sister, Galla.

The emperor eventually established his two sons as successors: the older son, Arcadius, was to remain in Constantinople as senior Augustus while Honorius, his younger son, was to rule the West. Throughout his reign it had been the aim of Theodosius to maintain the unity of the empire but paradoxically, by designating his sons as rulers of an eastern and western territory respectively, the end of the 4th century foreshadows later developments leading to regional separation and a cultural parting of ways between East and West. In Church matters he was staunchly orthodox, and it was in his time that Christianity finally won its place as the religion of state. Theodosius' religious legislation granted a measure of tolerance to the Jews but was heavy-handed in dealing with pagans and heretics. A grateful Church would later call him "the Great".

The immediate successors in the Theodosian dynasty were singularly undistinguished. During their reigns the prominence at court of military men rather than men of culture is not surprising given the dangers surrounding the empire. In the year of Theodosius' death the Huns had overrun Syria and Mesopotamia while the Visigoths ravaged the Balkans. As a precautionary measure, Anthemius, praetorian prefect of the east under Theodosius II (408–50), surrounded Constantinople with additional defences, the Theodosian walls, which made the city virtually impregnable. The rule of Theodosius II is furthermore distinguished by the founding of a school of higher learning in Constantinople. This may have been due to the influence of the emperor's wife, the learned empress Eudocia. As a final achievement in 438, together with Valentinian III, he issued the Theodosian Code, which is the earliest imperial collection of laws.

The era was dominated by disputes over Christian dogma, and in 451 the emperor Marcian, who had succeeded Theodosius II, called the Fourth Ecumenical Council to meet at Chalcedon. It was to determine the thorny question of the nature of Christ, and ended condemning both the Monophysite and the Nestorian interpretations of the dogma. The council pronounced that Christ was both God and Man, and reaffirmed the status of the Virgin Mary as *Theotokos* ("one who gave birth to God"). The importance of the council lies furthermore in that it established Constantinople as ranking second only to Rome. Chalcedon remained a benchmark in the history of the Church, and further disagreements

would inevitably be measured against the canons it had established.

Athens, ancient abode of Greek philosophy, although in decline, could still in the 5th century boast of being its centre. Proclus of Constantinople, the last important representative of Neoplatonic thought, taught there. The influence of philosophy may have been waning but there were many writers in this troubled century who recorded interesting aspects of the new enemies threatening the empire. One of them, Priscus of Thrace, had been a member of an embassy to the court of Attila, king of the Huns. He observed much about the customs of these people, and his work became a source for later authors such as Cassiodorus and Jordanes. The pagan writer Zosimus wrote a *New History*, which ends with the Visigothic siege and sack of Rome in 410. He contends that this calamity was brought about by the anger of the pagan gods for having been abandoned by the Romans, and he blames Constantine the Great for it. By contrast, he has the highest regard for the emperor Julian.

In this period three elements – Christianity, Hellenism, and the orient – provided the basis for the development of a distinctly Christian art; and imperial Constantinople became central to Christian culture in its eastern form. The "New Rome" was able to assimilate and transmute the various elements into a new artistic and cultural synthesis.

In the eastern Mediterranean the early churches of the Holy Land, such as those of Jerusalem, Bethlehem, and Nazareth, belong to the era of Constantine's dynasty. The monastery of St Simeon Stylites (Qalat Seman) between Antioch and Aleppo remains an impressive witness to this splendid early achievement, even as a ruin. Arcadius (395–408), the successor of Theodosius the Great, built a basilica in the Maryut desert near Alexandria over the grave of Menas, a revered Egyptian saint. There is thus evidence that imperial generosity and support for the Church reached well beyond the confines of the capital.

When the emperor Justin I died in 527, his nephew Petrus Sabbatius became emperor as Justinian I (527–65). His reign, although it has its critics, is generally regarded as a "golden age". It seems that Justinian's plans were oriented towards the West from the beginning. Latin was emphasized as the language of government, and religious orthodoxy, in the sense of the western Church, was enforced. The religious policy of Justinian aimed at orthodox conformity, in spite of his empress's Monophysite sympathies. His main effort, however, was to eradicate all traces of paganism. In this spirit, in 529 he closed the Academy in Athens, which had been founded 900 years earlier by Plato. By contrast, the school of higher learning that had been established earlier in Constantinople continued to flourish into the days of the emperor Maurice (582–602). The main aim of this institution was no doubt to provide the imperial government with educated bureaucrats.

The emperor himself was engaged in theological disputes, and wrote dogmatic tracts and hymnology. His many achievements, nevertheless, are celebrated by the historians of his reign. Foremost among the latter stands Procopius of Caesarea. Educated for a career in law, he became secretary to Justinian's general, Belisarius, the conqueror of Vandal Africa and Ostrogothic Italy. In this position he had access to letters, dispatches, and conversations that together with his personal observations inform his writings. In addition to Procopius' official histories of Justinian's wars and building activities, in the *Anecdota* he launched a vicious attack on the emperor and his consort, Theodora. His works, for all their exaggerations, are nevertheless of great historical value, and are important for the information they contain on the early Slavic and Germanic peoples.

A contemporary of Procopius, Peter the Patrician, composed, among other things, a treatise on court ceremonies, part of which was later incorporated into the writings of Constantine VII Porphyrogennetos (913–59) in his own work on this subject. Procopius was followed by Agathias who wrote poems, epigrams, and a history of the reign of Justinian covering the period from 552 to 558. Agathias was in turn succeeded by Menander Protector who related events up to the accession of Maurice. Although extant only in fragments, Menander's history contains valuable information on geography and ethnography. It was continued by Theopylaktos Simokattes whose major work, a history of the reign of Maurice, and probably written early in the reign of Herakleios (608–41), is an important source.

A bureaucrat under Justinian, John the Lydian, wrote a treatise on the administration of the empire. John, it is said, was much valued by Justinian on account of his excellent education; so much so that he commissioned him to write an imperial panegyric. The era of Justinian furthermore produced works on a broad geographical scale, such as the *Christian Topography* of Cosmas Indicopleustes, and the statistical survey of the political geography of the empire, the *Synekdimos* of Hierocles. This latter work was to become an important source of geographical information for Constantine Porphyrogennetos. There were also writers of chronicles such as John Malalas. He was a Syrian from Antioch who could boast little education, but his chronicle, written in vulgar Greek, spans the time from the early Egyptians to the end of Justinian's reign. It became immensely popular, and exerted much influence beyond the borders of the empire when it was translated into Slavonic.

Church history in this era is represented by the Syrian Evagrius, who wrote about ecclesiastical events from the Council of Ephesus (431) to the year 593, and John of Ephesus (d. *c.*586), who wrote his work in Syriac. The latter's account is written from a Monophysite viewpoint. This bias is important since Monophysitism was then the prime theological dispute, and, by extension, a hot political issue as well. In addition to his *Ecclesiastical History*, which begins with the time of Julius Caesar and ends in 585, he also wrote a work on the lives of the eastern saints. Another contemporary of both Justin and Justinian was Leontius of Byzantium. His polemical writings, which expound an orthodox religious view, are typical of a Byzantine intellectual who moved gradually away from the once fashionable Neoplatonic thought and nearer to that of Aristotle.

There is finally a host of authors of hagiographical and devotional literature. Cyril of Scythopolis, a monk of the Palestinian lavra of Mar Saba, wrote saints' lives but his work remained incomplete. But, even so, his writings are a valuable source for cultural history. Another Palestinian monk, John Moschus, composed in Greek *The Spiritual Meadow* (*Leimon*) in which he gathers together the experiences gained in his travels to monasteries throughout the east. This work became

favourite reading in the Byzantine empire and neighbouring countries. Given the interest of the reading public in matters of religion, the era may justly be called an "age of spirituality".

Romanos the Melodist, a writer of hymns, lived in the reign of Justinian. It is thought that he was the creator of the *Akathistos* hymn in praise of the *Theotokos*. It is worth noting that the Virgin Mary rose in the 6th century to her exalted place as the protectress of Constantinople, and that in the reign of the emperor Maurice her ascension into heaven became a feast day. Paul the Silentiary too was a contemporary of Justinian. He celebrated in Greek verse the beauty of the emperor's great church, Hagia Sophia, and particularly its splendid pulpit. Paul's poetry on this subject is still of much interest to art historians today.

The North African writer Corippus, who wrote his work in Latin, lived at first at Carthage but was later called to the imperial court at Constantinople. His works give testimony of the continued use of Latin into Justinian's reign. His *Johannis* was written in praise of John Troglita, the general who successfully put down a revolt against the imperial regime in North Africa. In addition, a panegyric of Justin II by Corippus contains interesting material on 6th-century court ceremonies. Finally, there was a body of entertainment literature such as romances and novels that was popular with the educated populations of the great cities of the empire. It is easy to conclude from the foregoing brief overview that the age of late antiquity preserved, and even expanded, its literary heritage.

As lawgiver, Justinian realized that the Code of Theodosius no longer served the needs of the law courts. It was largely incomplete, and earlier laws existed in scattered collections only. Thus he decided to replace it. A committee was established under the chairmanship of Tribonius, his quaestor, and in 529 the first edition of the new code was issued. But it had been too hastily compiled, and this made it necessary to produce a revised edition, in 534. Justinian's code consists of three parts: the *Institutes* (a legal textbook), the *Digest* (a commentary of jurists from the 2nd century onwards), and the *Corpus Iuris Civilis*, beginning with the praetor's edict under Hadrian and continuing to the time of Justinian. Later, Justinian's own legislation, the *Novellae*, was appended to the code. It remained a source of legal thought in Christendom, and when it was reintroduced in the West from the 11th century on, it became the foundation of civil law in continental Europe.

The other great achievement of the age of Justinian lay in his building activities, the most outstanding example of which is the monumental church of Hagia Sophia in Constantinople, built after an earlier church had been destroyed in the Nika rebellion of 532. Hagia Sophia is a domed basilica, with the enormous central dome rising over a longitudinal nave; and its interior is splendidly decorated with richly coloured mosaics and marbles. Throughout the ages, this church made such an impression on visitors to Constantinople that a whole body of legends and miraculous stories began to circulate, influencing even writers of Slavic and Islamic cultures. The other important church erected by Justinian, and designed by the same pair of architects who had planned Hagia Sophia, namely Isidore of Miletus and Anthemius of Tralles, was the church of the Holy Apostles which, originating in the time of Constantine the Great, was in such disrepair that the emperor decided to rebuild it. It remained as the burial place of the Byzantine emperors up to the 11th century but was destroyed in the Turkish conquest of Constantinople by Mehmet II to make room for his own mosque. Today the church of St Mark in Venice, which was modelled on the Holy Apostles, gives an indication of what its prototype in Constantinople must have looked like.

An outpost of Byzantine administration in the West in the 6th century, the exarchate of Ravenna had previously been first the capital of the western government under the emperor Honorius (395–423) and after that of Ostrogothic Italy. The period of the exarchate represents a brilliant phase in the architectural history of that city. When Ravenna fell to the conquering Byzantine army under the command of Belisarius, the church of San Vitale, the construction of which had already been started under the Ostrogoths, was then completed by order of Justinian. The other great church of this period is San Apollinare in Classe, the harbour of Ravenna. Grandiosely conceived in their architectural design, the most outstanding features of these churches are the mosaics. The apse of San Vitale contains the most discussed mosaics of Justinian's reign, showing on facing panels the emperor and empress, surrounded by their courts.

As recorded by Procopius in his *De Aedificiis*, Justinian built, in addition to these churches, fortifications, monasteries, baths, hospitals, and aqueducts. Little remains today of these buildings, and some are now known only through literary descriptions. Besides the great architectural and literary achievements of the age, the creations of the so-called "minor arts" should not be forgotten. These works in carved ivory, woven textiles, intricate metalwork, and colourful enamels still convey today the brilliance of the Byzantine achievement in late antiquity. As Gervase Mathew reminds us, "In Byzantine civilization these arts are never minor."

Tiberius' reign (578–82) ushered in a new era in Byzantine history. The emperor turned his attention to the affairs of the threatened East, abandoning much of Italy to the Lombards and leaving only the exarchate of Ravenna and parts of southern Italy under imperial control. A similar policy was pursued by Maurice who succeeded him in 582. He himself was an educated man who had risen in both the bureaucracy and the military, and presumably would have been sympathetic to the high culture of his day. This is supported in various sources that point to the achievements of his reign. But with the empire threatened once again by the might of Persia, and inroads of Avars and Slavs in the Balkans, there was little to spare for cultivating the arts. The so-called *Strategikon* (General's Handbook) of the emperor Maurice may have been written in his time, bearing testimony to the military concerns of the age. In the end, the emperor's political realism accompanied by stringent fiscal measures proved unpopular, and he fell victim to an army rebellion in 602.

The following reign, of Phokas (602–10) who had led the uprising against Maurice, is a dark page in the cultural life of the empire. The era is characterized by anarchy, foreign invasions, and internal conspiracies. With the coming of Herakleios, son of the exarch of Africa, the empire entered into a period of great military conflicts with Persia and the Avar power. Jerusalem was captured by the Persians who penetrated as far as Egypt. It was only in 628 that Herakleios was able to

overcome the Persians and decisively crush Sassanian might. In the Balkans he established suzerainty over the Slavs following the waning of Avar control in the region.

In religion, too, Herakleios tried to find a solution to the vexing conflict with Monophysitism, issuing the *Ekthesis* or Exposition of Faith in 636, recognizing two natures but one will in Christ. The *Ekthesis* aimed at reconciling the Monophysites in the eastern provinces. It was, however, too late since at the same time the rapid conquest of these provinces by Arab forces under the banner of Islam had begun.

Ironically, the territorially shrunken Byzantine empire became more homogeneous as a result of having lost most of the provinces in which Monophysitism was strongest. This process was complete when Egypt too was conquered by Amr, the Muslim general, in 658. The empire became distinctly Greek in speech and culture in the time of Herakleios who, by taking the title of *basileus* (king), finally broke with the tradition of his predecessors who had styled themselves successors of the first Roman emperor, Augustus.

The early part of Herakleios's reign had been a struggle for the very existence of the empire, and the later period was overshadowed by the Arab menace. For this reason the intellectual life of the age was at an all-time low. Nevertheless, George of Pisidia, the deacon of Hagia Sophia, celebrated the reign of Herakleios in three historical works, and composed a panegyric in his honour on the occasion of his final victory in the conflict with Persia. George was later much appreciated by the 11th-century scholar Michael Psellos who considered him an equal of Euripides. The so-called *Chronicon Paschale* was composed in the reign of Herakleios and, although largely unoriginal, contains some interesting historical remarks about contemporary events.

The dynasty of Herakleios ended in 711 with the death of Justinian II. After a brief interlude of non-dynastic rulers, Leo III founded a dynasty that lasted until 802. The iconoclast emperors of Leo's house shook the very foundations of Byzantine religiosity when they legislated against religious art, and especially the veneration of icons, many of which were believed by the people of the empire to be heavenly manifestations "not made by human hands".

The period was also characterized by the great struggle between Byzantium and Islam. In an all-out offensive, the Muslims tried to take the capital, Constantinople, itself. The attempt failed thanks to the skilful use of Greek fire and the severity of a winter campaign that made the Muslim forces withdraw in 718. It was the last Arab attempt to take the "God-protected" city, and given the importance accorded to Leo's victory by later generations, it assumes historic significance. Constantinople had become the "sacred fortress" of Christendom in the minds of many.

Leo's reign is also remembered for the emperor's legislative activity. He realized that Justinian's code, which had been composed in Latin, no longer reflected the conditions of the Greek-speaking empire. His code, the *Ekloga*, was issued in the name of the "wise and pious emperors, Leo and Constantine".

Modern scholarship has tried to find connections between the Arab danger to the empire and Leo's iconoclast legislation. It is also thought that Leo, who was probably of Syrian origin, was influenced by Jewish and Muslim thought in the matter of images. Both religions considered the use of icons as a form of idolatry, and it has been noted in the historical analysis of iconoclasm that the caliph Yazid II forbade the Christians in his territory to venerate images three years before Leo's edict to the same effect.

Whatever provoked the emperor's stand on icons, his and his successors' legislation had far-reaching consequences, especially when after the Synod of Hieria (754) the destruction of sacred art was carried out with brutal efficiency. In this attempt to stamp out the worship of sacred images, icons, whether painted or in mosaic, sculpture, or illuminated manuscripts, were ruthlessly destroyed. This wholesale destruction was also accompanied by the annihilation of relics. Ironically, what remained of earlier religious art survived mostly in the provinces that had been lost to Islam and which were therefore beyond the reach of the imperial government.

It was in the reign of the empress Irene (797–802) that icon veneration was once more temporarily established. The second period of iconoclasm, however, ended only in the regency of Theodora, wife of the emperor Theophilos, who convened a council that reinstated the legality of icons throughout the empire in 843. The date of this event, 11 March, is to this day celebrated in the Greek Orthodox Church as the feast of Orthodoxy.

Much as the iconoclast emperors had achieved in their reigns, their policies hastened the rupture with the papacy, and made possible the crowning of Charlemagne as emperor of a renewed Roman empire in the west in 800.

Summary

From 330, the dedication of Constantinople by Constantine the Great, to 843, the triumph of Orthodoxy. Architecture and Christian literature develops under Constantine. Intellectual life flourishes in Egypt. Christianity becomes state religion under Theodosius I. Fourth Ecumenical Council at Chalcedon determines Christ's nature. Athens remains the centre of Greek philosophy. The Golden Age of Justinian in the 6th century as seen in Ravenna and elsewhere. Period of iconoclasm is followed by the triumph of Orthodoxy.

Byzantine Period, Middle 843–1204

The middle Byzantine period began with the re-establishment of the veneration of icons in 843 and ended with the fall of Constantinople to the Crusaders in 1204. The period has been characterized as the "classic" phase of Byzantine civilization, when many of those features usually seen as most typically Byzantine from the modern point of view can be most clearly discerned.

Although the overall structure of imperial government and Church administration remained similar to that of earlier centuries, the social and economic role of local landowners and monasteries increased considerably compared with the early Byzantine period. Many new monasteries were founded, including the great monastic centres at Mount Athos and the Meteora in Greece, and these had a high degree of autonomy. The autonomy of the local aristocracies, within the thematic administrative structure already established, was also greater than in the early Byzantine period, and these rural "lords" came to play an important role in Byzantine society in general.

Accordingly, the middle Byzantine countryside was divided into large estates, owned by monastic houses or secular magnates. Rural society and economy became increasingly "feudal" in organization, especially at the end of the middle Byzantine period. There was a strict social hierarchy, although a degree of social mobility is apparent. However, the government in Constantinople retained control of the empire and was able to collect taxes, issue coinage, and enforce laws. Greek was the language of government, but religion – not language – became the defining feature of the Byzantine political and cultural identity, although a "Roman" identity was still also asserted.

Although an episcopal structure of Church administration remained, focused on the patriarch of Constantinople, the most distinctive characteristic of the middle Byzantine Church was the many monasteries, large and small. Middle Byzantine monasteries tended to share a similar layout, as exemplified both on Mount Athos and at the Meteora and on a smaller scale at many lesser monastic centres, as at Sagmata in Boeotia. Enclosed by a wall, with an elaborate main gate, they were centred on a church set in the middle of a courtyard. Around this were the monks' accommodation, refectory, and other buildings, often of more than one storey in height. As these examples show, in Greece and the Balkans especially, a large number of middle Byzantine monasteries still survive today as religious houses and many church buildings of this date also remain in use.

In cultural terms, probably the most important change affecting the middle Byzantine Church was the end of iconoclasm. This restored the veneration of icons to the liturgy and acted as a stimulus both to the arts (especially mosaic and painting) and to the monastic movement. Throughout the period the Church also actively supported a wide range of intellectual life, including literature and secular learning. In particular, Constantinople itself became a major centre for renewed academic and artistic activity. Thus, during the middle Byzantine period a distinctive new artistic style emerged that owed less to the Roman past than had early Byzantine art and which was often – although by no means universally – religious in its subjects.

Byzantine culture also began to encompass peoples outside the empire, as Orthodoxy gained new converts beyond the imperial frontiers. New Orthodox states were established following the conversion of the Bulgarian ruler (Boris I) in 864 and tsar Vladimir of Russia in 988. One result of this may have been the formation of a cultural, religious, and perhaps political zone centred on Constantinople, in which courts and the

Middle Byzantine Period: 9th- or 10th-century mosaic of Christ in Glory, church of Hagia Sophia, Thessalonica

Church in a number of independent states emulated Byzantine institutions: the "Byzantine Commonwealth".

It was in this period, too, that Byzantine church architecture began conventionally to employ the "cross-in-square" or "inscribed cross plan", which has remained a model for Orthodox churches ever since. During the middle Byzantine period this rapidly became the standard form of church building, and examples are known throughout the empire. Perhaps among the earliest churches of this form still standing are at Tirilye (in Bithynia), Side (in Turkey), and Skripou (in Boeotia). At Constantinople the first church employing this plan may well have been the Nea Ekklesia at the Great Palace (880). However, the oldest examples still in existence in the Byzantine capital are the Myrelaion and the Monastery of Constantine Lips churches, dating from the 10th century.

The origins of the cross-in-square church are obscure: some scholars have detected early Byzantine provincial (perhaps Armenian) predecessors to this distinctive plan; others think it originated from the architectural elaboration of cross-domed churches. Whatever its origins, the cross-in-square church is perhaps the archetypal middle Byzantine monument, although it is important to note that the rock-cut churches of Cappadocia include examples with many other plans. This may suggest that there was a wider diversity of middle Byzantine church forms than the evidence of free-standing buildings would imply, and the rock-cut churches themselves also remind us that regional constructional techniques and building types still existed.

Churches are associated with other architectural developments of the period. These include an increased emphasis on the exterior appearance of buildings; a tendency for smaller, more compact structures; and a formalization of the decorative programme of churches, so that different buildings tend to have similar schemes of art. These artistic programmes show biblical scenes, saints, and notables in a strict hierarchy throughout the church building, with Christ depicted in the (almost ubiquitous) dome.

Secular palaces known from middle Byzantine written sources also often seem to have adopted a plan similar to monasteries – that of a courtyard with central church – although rural aristocratic centres also included castle-like hilltop fortresses, appropriate to the military lifestyle of the secular rural elite.

In the borderlands where these "lords" were strongest, they

existed in a society that, while strongly Christian in its religion, was open to much Islamic cultural influence, as reflected in the fictional story of Digenis Akritis. The extent to which a fusion of cultures emerged in this border area is unclear. For example, there seems to have been some Islamic influence on the architecture of Byzantine palace buildings from the 9th century onward. This was not only in the eastern borderlands that were adjacent to Islamic polities, but even in Constantinople. The earliest instance of this is perhaps the palace built at Bryas (near Constantinople) by emperor Theophilos (829–42), which was explicitly modelled on buildings in Baghdad. Later, emperor John II Komnenos (1118–43) built a Seljuk-style pavilion (the Muchroutas) in the Great Palace at Constantinople.

Much more problematical is the extent to which Islamic architectural styles were employed in secular contexts in eastern Anatolia itself. In Cappadocia many middle Byzantine buildings – especially elaborately decorated churches – were cut into the soft tufa. Some have both Byzantine and Islamic architectural features, and it has been suggested that some may be the mansions of local secular landowners, although the more usual interpretation is that they all represent churches and monasteries.

Throughout the Byzantine empire both monastic communities and the rural aristocracy gained their economic support mainly from agriculture. The rural population lived in small villages, but little is known about such settlements archaeologically and they were seldom described in detail in texts. Most likely, they characteristically contained wooden or stonebuilt rectangular houses, with tiled or thatched roofs. Most villages probably also had a church, serving as the focus for the community.

However, although the economy was predominantly agricultural and the population mostly dwelt on the land, towns did exist, as at Thessalonica and Pergamum. Constantinople, the capital, was still by far the most important political, cultural, and trading centre and the largest city. In the 9th century both it and many of the provincial towns seem to have been smaller and very different in character from their early Byzantine predecessors. However, during the middle Byzantine period it seems that both Constantinople and other towns grew in size and acquired new commercial roles.

Characteristically, the middle-Byzantine period town contained closely packed stonebuilt houses (examples of which have been excavated at Athens and Pergamum) set along narrow streets, within a defensive wall. The civic buildings and other monuments of earlier periods were largely disused, and the principal public buildings in most of these towns (as in the villages) were churches. Monasteries were more common within middle Byzantine towns than had perhaps previously been the case, and crafts, including pottery production, were carried out within towns as well as in the monasteries and villages in the countryside.

Middle-Byzantine pottery is very distinctive. From the 7th century at the latest, Byzantine pottery was often glazed, and glazed and elaborately decorated pottery characterizes middle Byzantine assemblages. For example, "polychrome ware", glazed white vessels highly decorated with red, blue, and black paint, is characteristic of the middle-Byzantine period. A range of wall plaques, in the same style, adorned many buildings in Constantinople, as at St John Studios, the Myrelaion, and the Great Palace itself. Many other types of glazed pottery were also produced, as well as unglazed vessels and amphorae. These are commonly found at Byzantine town and monastery sites during excavation, but their study is hampered by a lack of well-dated archaeological contexts.

Other material changes in everyday life are also evidenced. For example, although wall mosaics were still made, floor mosaics – common in major buildings in the early Byzantine period – were no longer routinely laid. *Opus sectile* (a floor made of larger pieces of marble or other stone placed in designs) took their place. While this may be no more than a matter of fashion, some indications of technological change seem to be present. To give one example, aqueducts seem no longer to have supplied the needs of towns for drinking water. Instead, water was commonly stored in cisterns, one of the most widespread features of Byzantine sites of this date.

Thus, the middle-Byzantine period shows both continuities and discontinuities from the early-Byzantine period in culture, administration, society, economy, and in its material aspects. This has led to much debate over a range of related issues, including the connection between middle-Byzantine culture, society, economy, and technology and those of the Roman world, the degree of innovation present in the middle-Byzantine period, and the extent and character of both feudalism and urbanism. Nevertheless, few would doubt today that the middle-Byzantine period saw some of the greatest cultural and political achievements of Byzantine civilization.

Summary

Dated from 802 to 1204, the middle-Byzantine period is often regarded as the "classic" phase of Byzantine culture. Following the Triumph of Orthodoxy (the restoration of icons) in 843 many monasteries were founded. Religion, not language, became the criterion of cultural identity. The arts and learning flourished and the Church was their principal patron.

Byzantine Period, Late 1261–1453

The final phase of Byzantine civilization presents a remarkable paradox of health within infirmity.

During the final two centuries of Byzantium's history, its political situation was one of consistent decline. The recovery of Constantinople in 1261 by the imperial regime in Nicaea seemed to vindicate Byzantium's humiliation of 1204. But when the first ruler of the new (and ultimate) dynasty of the Palaiologoi, Michael VIII (1259–82), boldly attempted to play a grand role in international politics, he was in fact stretching the capacities of his realm to near breaking-point. His successors were obliged to confront the realities of governing what had become a minor local state – "the empire of the Straits" it has been called – within a context of international affairs in which neighbours and rivals were far greater powers. External weakness was compounded by internal dynastic and social conflicts which made it the more vulnerable to the aggressions of its neighbours, especially the Serbians in the first half of the 14th century, and then the Ottoman Turks in the second half. Even before the beginning of the 15th century, a half-century before the final debacle of 1453, Byzantium was a ravaged spectre of a state: its lands reduced to Constantinople, a few islands, and other scraps of territory, its economy largely in the hands of others, and its government little more than a holding operation in the face of looming destruction.

Yet, for all the outward decay and degradation, Byzantine civilization remained remarkably vibrant and productive, even allowing for the reduction in patronage and economic resources. The sheer volume of its cultural legacy is extraordinary – and is still only beginning to be investigated and explicated in full.

The intellectual life of the Palaiologan era owed much to the cultural recovery launched under the Laskarid regime in Nicaea (1204–61). Nicaea (modern Iznik) was not the only refuge for institutional and cultural leadership among the fragments of the Byzantine world that had been smashed by the Fourth Crusade. But it soon became the most promising and consistent focus of claims to the traditions of Constantinople. From that great city's dispersed court came remnants of the intellectual elite who painfully strove to reconstruct in exile the earlier educational and scholarly life. The principal exemplar of the Nicaean revival was the learned Nikephoros Blemmydes (1197–*c.*1269), whose students included the philosopher-historian George Akropolites and even the future emperor Theodore II Laskaris. By the time Byzantine government was restored in Constantinople, a thriving cultural life was ready-made to be transferred back to the capital. Nor was Constantinople to be the only centre: Thessalonica could at times claim to rival the capital in artists and men of learning, while Mistra in the Morea also became a lively centre in the later Palaiologan epoch.

The scholarly circles identified with the first two Palaiologan emperors, Michael VIII and then Andronikos II (1282–1328), included such eminences as Akropolites's student, the polymath-historian George Pachymeres (1242–*c.*1310), the remarkable philologist Maximos Planudes (*c.*1255–*c.*1305), and Theodore Metochites (1270–1332), a facile scholar, artistic patron, and court politician of the highest rank. The next generation was best represented by his student, the highly versatile polymath-historian Nikephoros Gregoras (*c.*1292–*c.*1360). In the realm of historical writing, too, the ex-emperor John VI Kantakouzenos produced in his memoirs an outstanding example of its kind; though, in truth, the writing of history was to lapse until a constellation of 15th-century writers (Chalkokondyles, Doukas, Sphrantzes) gave it one final flourishing.

The most impressive scholar of the 14th century was surely Demetrios Kydones (*c.*1324–*c.*1398), who not only continued the Byzantine philosophical emphasis on Plato but who attempted a short-lived programme of studying and translating works of St Augustine, Anselm of Canterbury, and Thomas Aquinas. Just as with Planudes's earlier translations of Latin authors (Cato, Ovid, Cicero, Caesar among the ancients; St Augustine among Christians) for his circle of Constantinopolitan scholars, Kydones's later effort to alert Greek scholarship to what Latin literature and thought might offer proved fruitless in the face of Byzantine conservatism. Nevertheless, it symbolized the attraction of Latin culture to certain Byzantine individuals and, in the case of Kydones himself, was part of a mental reorientation leading him to accept Thomist thought and convert to Roman Catholicism. His students, such as the emperor Manuel II (1391–1425), continued his strictly Greek philosophical and literary tradition, without his ideology. But Kydones's protégé, Manuel Chrysoloras (*c.*1350–1415), extended further the older man's bridge to the West when he became (1387) the first Byzantine scholar of front rank to teach ancient Greek language and literature to the Italian humanists of the western Renaissance – becoming a Catholic himself in the process.

Chrysoloras wrote the first grammar book of Greek in Latin, and trained the first generation of Italian scholars in the language. His work represented a great breakthrough that for the first time opened the innermost circles of Byzantine learning to western scholars. It thereby initiated a flood of scholarly contacts, involving visits by Italian scholars to Byzantine centres and, above all, a steady flow of Byzantine scholars to the new lands of professional opportunity in Italy and beyond. The earlier of these included George Trapezountios (1395–*c.*1472), John Argyropoulos (*c.*1393?–1487), and Theodore Gaza (*c.*1400–*c.*1475), all of whom adopted Latin Christianity. Outstanding among these, however, was Bessarion of Trebizond (*c.*1400–72): his important role in achieving church union at the Council of Florence (1439) won

him a cardinal's hat in the Roman Church, and thereafter he became a major intermediary for expatriate Byzantine scholars in Italy.

Byzantine learning has been criticized as archaizing pedantry, but its scholarly traditions created standards of philology and techniques of textual criticism that, together with knowledge of the ancient Greek language and access to the ancient texts, allowed Byzantine scholars to restore to western Europe a full knowledge of the literature of Classical Hellenism – a crucial contribution to the western Renaissance. A further intellectual influence was to direct Italian humanists to the study of Plato, which launched them in their decisive philosophical directions. This apparently resulted from discourses given during participation in the Council of Florence by Bessarion's teacher, the great scholar George Gemistos, who took the name of Plethon (*c.*1360–1452). Ironically, however, Plethon chose to remain a part of the Byzantine world rather than relocate in the West. In the final years of his long life, Plethon produced syntheses of his Platonic thought that were strikingly original and controversial. His intellectual opponent, the champion of Aristotle and upholder of Orthodox purity, George Scholarios, represents a kind of epilogue, in becoming the first patriarch of Constantinople under the Turks as Gennadios II.

The aforementioned are, of course, only among the most outstanding of a larger catalogue of scholars. Nor were philology and philosophy the only important areas of Palaiologan intellectual life. A final compilation of Byzantine law was achieved for immediate and practical use by Constantine Harmenopoulos in 1345. Though Byzantium has never been rated highly as a producer of great literary works, there was nevertheless, in its own terms, a considerable productivity in the Palaiologan era, not only in the rhetorical exercises of high culture that occupied the learned circles, but in popular writing as well. There was a particular flowering of the idiom of the Greek verse romance in the 14th century. Hagiography also enjoyed one final burst of activity, in a round of attention both to earlier saints and to contemporaneous holy men. This feature was hardly surprising in an epoch when the Church took on increasing prominence in a world in which the state was shrivelling so drastically: a world out of which the patriarch would survive the emperor as the force of leadership in the survival of Hellenic society and culture.

Accordingly, it is understandable that perhaps the most striking demonstration of Palaiologan cultural energy is shown in the sphere of theology. Beset by hostile ideological forces, Byzantine religious writers – both professionals and laymen – turned vigorously to the defence of their faith. There was a flourishing of debate with, and polemic against, Islamic religion, which had become such a potent threat with the progress of the Turkish conquest. The issue of church union with Rome – which was understood to threaten the compromising of Orthodox principles with Latin ones and the humiliating submission of Constantinople to Rome – was a recurrently provocative one for an era framed by two abortive union councils, those of Lyons (1274) and Florence (1439). Numerous treatises were composed to refute Latin doctrines, notably the so-called Double Procession of the Holy Spirit.

Even more stimulating to polemic, however, was the issue of hesychasm, the one significant theological controversy in Byzantium after the Christological debates and iconoclasm. Byzantine practices of mystical devotion, represented in private spiritual exercises in "silence" (*hesychia*), especially as a focus of monastic spirituality, were challenged in the 14th century and were given final definition by the last original Byzantine theologian, Gregory Palamas (*c.*1296–1359), whose ideas were adopted as official doctrine. The depth and virulence of the controversy over Palamism, however, partly reflected the increased importance and flourishing of monastic life itself in this late period. Nevertheless, the continuing transcendence of mystic theology over immediate polemic was exemplified in the writings of Nicholas Kabasilas, whose thought connects Palaiologan explication with the earlier traditions of Christian and Byzantine spirituality. The vitality of spiritual art is also reflected in lively activity in liturgical music, involving such important singer-composer-theoreticians as John Koukouzeles (d. *c.*1340) and Manuel Chrysaphes "the Lampadarios" who was active at the courts of the last two emperors.

In general, the particularly strong religious component of Palaiologan culture suggests an assumption, conscious or otherwise, by its participants that it was the spiritual dimension, rather than the political, which must provide the necessary guidance to those surviving the collapse of Byzantine government and society, and which must give the real meaning to what persisted of Hellenic identity.

In the realm of visual arts, of course, productivity is conditional upon the economic support system, whose decline or failure has its adverse effects. Building or rebuilding of monuments, especially churches, was extensive in the earlier part of the Palaiologan period, but gradually fell off. The survivals of late architecture are sporadic – few in Constantinople, more in provincial areas, especially in Thessalonica and, above all, in Mistra (numerous churches, the Palace of the Despots), whose prosperity in the late period contrasted ever more sharply with the capital's decline.

A last great burst of mosaic decoration attended the early Palaiologan decades. A great deal has been lost, but survives in the decoration of Holy Apostles' Church in Thessalonica, and in Constantinople in the magnificent *Deesis* panel in Hagia Sophia's south gallery. A climax was reached in the stunning ensemble of mosaics and frescoes in the reconstructed Chora Monastery (present-day Kariye Djami), as financed by Theodore Metochites and as restored to virtually complete glory today. The high cost of mosaic work reduced its role as a medium in the later Palaiologan period, but its place was filled more than robustly by the predominance of fresco painting. Artists in this medium explored more dramatic techniques of representation and extensions of iconography. Their achievements reached a peak in the 14th- and 15th-century churches of Mistra. But Byzantine monumental artists extended their work and influence not only through the provinces but into neighbouring areas, with rich results in such areas as Serbia, Russia, and Georgia. The continued vitality of Byzantine artistic style also provided inspiration for the flourishing in Italy of the so-called *maniera greca* in the 13th and 14th centuries, helping to shape such artists as Duccio. It is even argued that Byzantine innovations strongly influenced Giotto and other figures of what was to become early Renaissance art in Italy.

In addition to monumental art, the medium of manuscript illumination continued to prosper in Palaiologan Byzantium, even if with diminished court patronage. Finely illustrated books were produced not only in Constantinople but in other centres, such as Thessalonica, down to the early 15th century. Particularly important was Palaiologan icon painting, with surviving works of great power coming out of both the capital and Thessalonica – e.g. the Ohrid icon of the Annunciation from early 14th-century Constantinople. Some painters from this period are known by name, and by far the most interesting and perhaps important is Theophanes the Greek. He worked his way from Constantinople through Russian lands in the late 14th century, in the media of both fresco and icons, contributing greatly to the flowering of Russian painting thereafter, as extended in the work of Andrei Rublev (*c.*1365–1430) and his followers.

Likewise, the momentum of Palaiologan creativity would not be halted in the Greek world itself by the disaster of 1453, but would survive in traditions of fresco and especially icon painting under foreign rule. This was particularly true of the great icon painters of Crete and other islands under Venetian rule, whose lively productivity flowered on through the 17th century. It climaxed in one highly personal tangent followed in the West by Domenikos Theotokopoulos or "El Greco" (*c.*1548–*c.*1625), and it ended in the 18th-century Corfiote school, which was in turn made the basis for the present-day revival of icon painting that flourishes in the monasteries of Mount Athos and elsewhere in Greece. Once again, not even the attempted murder of Byzantine civilization could entirely end its life and influence.

In all, it has to be observed that the Palaiologan era constitutes not only a viable phase in the history of Byzantine art, but also one of its most important ones.

Over the centuries, Byzantium had repeatedly demonstrated the vitality of its society and the tenacity of its cultural traditions, surviving near-catastrophes and regenerating itself. The Palaiologan era displayed yet again those characteristics, amid the very cataclysm of its conclusion. Even when its political embodiment, the imperial state, had been wasted and destroyed, depriving it of outward independent structure, that civilization would still not truly die. It would live on to some degree under Turkish rule, eventually to feed into the modern regeneration of the Greek world. The stubborn vivacity of Palaiologan culture thus gives final testimony to the overall strength of Byzantine civilization as a whole, within the still larger context of the enduring and evolving Hellenic tradition.

Summary

From 1261, when Constantinople was recovered from the Latins, to 1453, when it fell to the Ottoman Turks. A remarkable cultural flowering known as the Palaiologan Renaissance, when there was great activity in the areas of scholarship, law, literature, theology, and the visual arts. Although politically the empire disintegrated in this period, Byzantine civilization was flourishing to the very end.

Byzantines

The people to whom we conventionally apply this term would not have made much sense of it – a reminder that ex post facto historical labels and terms can often be very misleading.

The word "Byzantine" derives, of course, from the original name for the city on the Bosporus that was to become Constantinople. It was created in the mid-7th century BC by Greek colonists from Megara, and named Byzantion (or Byzantis) after Byzas, its supposed founder. When Constantine the Great expanded it as his new residence, to be called his city, *Konstantinoupolis*, it became the capital of the medieval "Greek" empire which is reckoned as lasting, from Constantine's refoundation in AD 324, for more than 11 centuries (with a brief interlude of Latin rule, 1204–61) until its storming by the Ottoman Turks in 1453.

It is true that Greek writers of the Middle Ages, at least those of intellectual circles enamoured of retaining ancient nomenclature at the cost of all reality, continued to use the name *Byzantion* in hyper-refined application to Constantinople itself, and such writers might also use the word *Byzantioi* for its citizens alone, as an archaizing artificiality. But even these writers would never describe their entire state and society as *Byzantion*, nor would they call themselves *Byzantioi* as a general population. It was rather the first generation of post-1453 western scholars, notably the German humanist Hieronymus Wolf (1516–80), who began the practice of calling the state "Byzantium" and its people "Byzantines". Other terminologies have also been brought into play, the imperial continuation of late antiquity being called such things as "Le Bas-Empire", or "later Roman" or "east Roman" empire, with "Byzantine" reserved for the phase of civilization running only from the 8th, or perhaps the 7th, century onward. Nevertheless, labels of "Byzantium" and "Byzantine" have persisted and are generally applied uniformly in historical usages today to the full span of AD 324–1453.

As for the people of that time and civilization, for the most part, they would no more have called themselves "Byzantines" than they would have called themselves "Greeks" (*Hellenes*). In medieval usage, the word "Hellas" was a geographic and administrative term applied to part of what we think of as both ancient and modern Greece. But, by the late Roman era, "Hellene" became less an ethnic term than a cultural one, increasingly identified with paganism. The emperor Julian the Apostate (361–63) furthered that idea by identifying the cultural and religious paganism he hoped to revitalize as "Hellenism". Early Christian writers used "Hellene" consistently to mean "pagan" or "gentile", whereas secular scholars identified "Hellenes" as the writers of the ancient Greek tradition, to be admired for their wisdom and eloquence, but to be distinguished from savants since illuminated by Christian truth. Through the Greek Middle Ages, therefore, it was usually insulting to be called a "Greek". The Latin ambassador Liutprand of Cremona, for instance, learnt this to his peril in 968. His very life was endangered when documents connected with his embassy spoke of his German master as "emperor of the Romans" (*Imperator Romanorum*) while describing the sovereign of Constantinople as "emperor of the Greeks" (*Imperator Graecorum*).

What our "Byzantines" regularly and officially called themselves, in fact, was "Romans". While they understood "Rome" as the name for a specific city in Italy, they also regarded that city as bypassed and superseded by "the New Rome" of Constantinople, the older capital's very nomenclature now transferred eastward. What we have come to call "the Byzantine empire" was, to its citizens, "the empire of the Romans" (*basileia ton Rhomaion*), or simply *Romania*, and they were "Romans" (*Rhomaioi*). These usages continued all the way to the end of the empire, in the 15th century. Such terminology was known and acknowledged by neighbours beyond their frontiers: the Arabs (as would later the Turks) knew them as *Rumi*; the Greek word *Romania* was appropriated by Latins as the designation for the crusader world of Frankish feudalism on Greek soil; while the Ottomans were to designate their European territories as *Rumelia*.

For much of the Byzantine empire's history, this usage made perfect sense. The terms *Rhomaios* and *rhomaïkos* avoided the perspectives in which we are now so fixated, identified with ethnic consciousness and latter-day "national" concepts. Byzantium long continued the Roman empire's character as just that, a multiethnic and multilingual state containing numerous peoples, many of them conscious of distinctive identities, and even retaining their own local cultures. But the continuing refinement of *romanitas* developed a distinctly extra-ethnic meaning to the term "Roman" for those who used it.

Essentially, that term comprehended three important components. The first was the "Roman" heritage of law and divinely destined world sovereignty. The second was a "Hellenic" component of language and culture: among Byzantines, the verb *hellenizein* meant "to speak Greek [*to hellenikon*]" and one studied "the learning of the Hellenes", to become educated in the literature and thought of the old pagan

Greeks. The third component was the Orthodox Christian faith, increasingly as identified with the jurisdiction of the see of Constantinople.

As the empire's frontiers shifted and generally contracted over the generations, there were changes in ethnic composition and diversity, and one may wonder how much various population elements in the countryside understood of these three components. Latin was used in the earlier centuries essentially as an administrative tongue (dying out effectively by the 7th century). The educated were trained in a highly sophisticated, archaizing extension of Classical Attic Greek, while the urban classes in general spoke a simpler demotic street Greek. Local languages (Armenian, Syriac, Coptic; Slavic variants) might persist for a while, but even the uneducated must eventually have shared in some Greek as the working vernacular. What probably bound most together, however, would not have been secular culture but the beliefs and rituals of the Orthodox faith. Over the centuries, only the elite of the capital and other major cities would have understood fully the tripartite meaning of "Roman" identity.

Nevertheless, the "Roman" synthesis involved a dichotomy of pagan and Christian that could both persist and come apart. It is true that people we would call Greeks (mainly rural or small-town folk) continued to call themselves *Rhomaioi* well into the 20th century, preserving that combination of the two elements that emphasized the Christian, in contradistinction to the secular and citified stereotype of the *Hellenes* of modern Greece. By contrast, however, during the medieval era itself the Byzantines selectively rethought what "Hellene" might mean for them. By the 12th century, when the territories had been reduced to a more compactly Greek-speaking population which was painfully aware of the pressures of outside peoples, Byzantines began cautious use of the "Hellenic" label to apply to aspects of their life and identity without any negative (i.e. "pagan") associations. This process continued through the ensuing generations, with pride in the "Hellenic" cultural heritage becoming partially transferable as a sense of "national" identity.

The result was a blurring of distinctions between words and their meanings in late writings. Official use of the designation "Roman" continued for things Byzantine, but the word simultaneously began to be applied explicitly to "Western" peoples and things, in clear opposition to "Hellene" and "Hellenic" as words for Byzantines, who could now frankly be called "Greeks". For illustrations, we need look no further than two figures of the 15th century, otherwise bitterly hostile in their ideas. Thus, the controversial (even paganizing) philosopher George Gemistos Plethon proudly revelled in the identity of "Hellenes" as those linked to the glorious heritage of ancient (and pagan) Greece; while the churchman George Scholarios – as Gennadios II the first patriarch under the Turks – consistently used the word "Hellenes" to mean Greek Orthodox Christians. Each understood the word as carrying what we would recognize as ethnic implications, even if from distinctly different points of association.

We could, moreover, find an ironic parallel between the struggles of "Greeks" and "Turks" to establish their modern ethnic identities. We might suggest that there had to be made clear the same distinction between *Rhomaios* (imperial Byzantine Christian) and *Hellene* (modern Greek) as between *Osmanli* (imperial Ottoman Muslim) and Turk (secular national), on the part of peoples whose anthropological backgrounds involved much intermixing of stocks and evolution within changing worlds.

The complexity of these usages suggests the dangers of relying blandly upon modern concepts of ethnicity, which do not apply equally to the earlier eras of late antiquity and early Christianity. There is no question that what we call "Byzantium" represents the medieval phase of the Hellenic tradition, in its broadest terms. To understand who "Byzantines" were, however, requires a sensitivity to what "Hellenism" variously meant in different ways at different times, as much as a linguistic or cultural label as an ethnic one.

Summary

This term is applied conventionally today to the people who inhabited the Byzantine empire from AD 324 to 1453. They would not have called themselves Byzantines or even Greeks (Hellenes) but Romans. The three essential components of *romanitas* for them were: the "Roman" heritage of law and divinely ordained world sovereignty; Greek language and culture; and the Orthodox Christian faith.

Byzantium

City on the Bosporus, later known as Constantinople and Istanbul

Byzantium was founded at the southern end of the European shore of the Bosporus by Megarians, probably in association with other colonists from the Peloponnese and central Greece, in 668 or 659 BC according to respectively Herodotus (4. 144) and Eusebius (*Chronicle*). Its name is of Thracian origin, legend claiming the city's founders to be Byzas, son of the nymph Semestre or a Thracian king, and a certain Antes. Like any other settlement along the Bosporus and, to a lesser extent, the Hellespont (Dardanelles), Byzantium could potentially control maritime traffic from the Euxine (Black Sea) to the Aegean and the land route between Europe and Asia (Polybius (4. 38) details the city's mercantile advantages). Its defensible position, however, was such that the earlier Megarian colony of Chalcedon (now Istanbul's Asiatic suburb of Kadiköy) on the opposite shore of the Bosporus came to be known as "The City of the Blind". On a triangular peninsula bounded to the south by the Propontis (Sea of Marmara), to the east by the Bosporus, and to the north by the Golden Horn (a 7.2 km inlet which could serve as a protectable natural harbour), the city had only two drawbacks, exposure to the European hinterland to the west and a lack of drinking water. Both these were remedied in later centuries by the construction of increasingly massive walls and a system of aqueducts and vast open and underground cisterns.

The colonists settled on the eastern tip of the peninsula, which sparse archaeological finds suggest had been occupied as early as the 2nd millenium BC. Apart from traces of shrines to Aphrodite, Apollo, and Artemis between the churches of Hagia Sophia and Hagia Eirene, superimposition of later buildings has precluded the discovery of the Greek city. According to literary sources, however, a north–south wall of about 2 km with 27 towers and several gates enclosed to the east military headquarters, an agora, temples, sanctuaries (most notably to Zeus, Poseidon, Athene, and Dionysus), cisterns, a gymnasium, and a theatre.

Little is known of Byzantium's history until 512 BC, when the city came under Persian rule. Except for the period of the Ionian Revolt (499–494), this persisted until 478 when the Spartan Pausanias expelled the occupying garrison, only to be himself recalled by his government for alleged treason. Thereupon Byzantium joined the Delian League, although, when the Persian threat had receded and Athens was treating the member states as its empire, Byzantium twice attempted revolt (440–439 and 411–408). Its annual contribution to the league of 15 talents indicates a wealth at this time which was derived mainly from tuna fishing, tolls imposed on shipping in the Bosporus, and the resources of both European and Asiatic holdings. After the Battle of Aegospotami in 405 it came under Spartan control, but numismatic evidence proves that it joined the anti-Spartan sea league after the Battle of Cnidus in 394. Formally an ally of Athens from *c.*378, Byzantium revolted again in 357 in support of Rhodes, Cos, and Chios. Subsequently it came increasingly under Macedonian influence until, in alliance with Athens once more, it changed course and successfully held out against Philip II in 340–339 (to commemorate Hecate's succour at this famous siege the Byzantines put on their coinage her symbols of crescent moon and star, which were later adopted by the modern Turkish state). After the Battle of Chaeronea in 338 Byzantium came again under Macedonian sway, and in the 270s suffered severely from Galatian depredations.

In the following century its economic recovery was considerably aided by the privileged status granted to it as a reward for supporting the Romans during the Macedonian wars. This status was retained until Byzantium backed Pescennius Niger in his struggle for imperial power with Septimius Severus in AD 193–95. After a siege of two years, graphically and exaggeratedly described by Cassius Dio (75. 10–14), the Byzantines capitulated. Severus, however, rebuilt their devastated city, approximately doubling its area by constructing a new north–south wall about 800 m westward of its Greek predecessor from a point just east of the present Galata Bridge. Little of the layout of the Severan city is known, but a theatre and baths were built, the hippodrome commenced, and, probably, porticoes added around the agora from which a porticoed avenue led to the wall. (For the later history of the city, its topography, and monuments, see the entry on Constantinople.)

After an aborted attempt at building a new city in the Troad near the ancient Sigeum (at a location now known as Yenişehir) just south of the entrance to the Hellespont, Constantine I chose the site of Byzantium for his new and Christian capital. The city's perimeter was marked out on 8 November 324 and the dedication took place on 11 May 330. It is not certain what the emperor wished its name to be. Although it was most commonly referred to as Constantinople ("City of Constantine"), the Latin poet Publius Optatianus Porphyrius used (in *Carminae*, 4. 6) the expression "New Rome" as early as 324/25 (Cassiodorus' account of Constantine inscribing *Secunda Roma* on a marble column is, however, almost certainly legendary). Thereafter comparison with the ancient capital and rhetorical references to "New Rome" were increasingly favoured, but the earliest surviving attestation of this as an official name appears in Canon 3 of the First Council of Constantinople in 381. Used with considerable frequency by Byzantines over the centuries, "New Rome" was imitated later by the Seljuk Turks who, keen to uphold their imperial ambitions, named their capital at Iconium (modern Konya) "Rum". Later still, Moscow, as the new defender of the Orthodox faith, was described as "The New Constantinople" in 1492 and, from the early 16th century, as "The Third Rome". The Greek Ecumenical Patriarch was, and still is, officially "Bishop of New Rome", and for the Turks the patriarchate is *Rum Patrikhanesi*.

Constantinople was, however, increasingly referred to simply as "The City" (*I Poli*) and in the West as "The Great City" (Micklegard in the Icelandic sagas). The later Ottoman name of Stamboul or Istanbul is usually explained as a corruption of the Greek for "To the City", itself on occasion deliberately altered to Islambul or "Full of Islam". Owing to the

archaizing of the Greek literati the name Byzantium (*Byzantion*) was preserved, and "Byzantines" therefore meant the inhabitants of the city alone. Since the empire was a continuation of the Roman empire, its inhabitants, when not referring to themselves as citizens of a specific city, called themselves "Romans", albeit usually and increasingly in Greek (*Rhomaioi*). At least until the coronation of Charlemagne on Christmas Day in 800, the western world also unquestionably accepted the empire as "Roman" (in the 10th century the Ottonian dynasty ambitiously established a rival "Roman" empire). Only after their empire had lost its polyethnic nature and was almost exclusively Greek-speaking did its inhabitants ever call themselves "Greeks" (*Hellenes*), a term by which they had earlier designated their pagan forbears. The use of the word Byzantine to cover the whole empire and its people is a modern anachronism of convenience: a few scholars beset by scruples have preferred to speak of an East Roman civilization.

The term "Byzantine" (or "byzantine") is used today in popular speech only pejoratively. In art it signifies either excessive ornamentation or two-dimensional rigidity, the latter largely a consequence of familiarity with post-Byzantine rather than genuinely Byzantine icons. In a ceremonial context it not inaccurately signifies lengthy and ritualistic formality with more show than substance. In argumentation it signifies either meaningless verbiage or hair-splitting logic: these derive from despairing Byzantine attempts to solve theological conundrums such as "the indivisibly divisible and divisibly indivisible" dual natures of Christ and the subtle formulations of Byzantine theologians which offended their more forthright western brethren. However, by far the most common misuse of the word suggests intrigue, secretiveness, deviousness, and deceit. This is quite unfair since Byzantium had no more palace cabals than many other states (and fewer than some, including its successors, the Ottoman Turks). The misapprehension is, however, of long standing and stems partly from the complexities of the Byzantine civil service, which bewildered many simple-minded western crusaders. More influential, however, has been the contempt of these crusaders, to whom war was largely a game of chivalric ostentation, for the Byzantine understanding of war as an evil to be undergone only when all the resources of diplomacy had been exhausted.

The word "Byzantine" is used more properly today in two technical contexts. The Byzantine era is a chronology that, though devised as early as the 7th century AD, did not come into general use in the Byzantine world until the late 10th. A modification of the Alexandrian era, it numbers solar years from the creation of the world in 5508 rather than 5492 BC. Its year began originally at the vernal equinox on 21 March, but in the late 9th or early 10th century this was changed to 1 September. The Byzantine Rite is a liturgical system of mainly Constantinopolitan and Palestinian rites. Commonly divided into Late Roman, Imperial, Stoudite, and Neo-Sabaïtic phases, it reflects successively the Antiochene origins of many early patriarchs of Constantinople, the imperial magnificence of Justinian in particular, the Palestinian monasticization of Theodore of Stoudios, and the Palestinian modifications of the Lavra of Mar Saba. It reached its definitive form under the Athonite hesychasts in the 14th century, by which time it was used throughout the Byzantine world with the exception of southern Italy and Russia.

C

Cacoyannis, Michalis 1922–

Film-maker, scriptwriter, theatre director, actor, and translator

Together with Thodoros Angelopoulos (1935–), Michalis Cacoyannis is the best-known film maker working in Greece today, with an established international reputation. In 1995 a retrospective of the director's work was staged at the Thessalonica Film Festival. Between 1954 and 1992 Cacoyannis directed 13 feature films, a documentary on the Turkish invasion of Cyprus, and the successful television drama *The Story of Jacob and Joseph* (1974). He has also worked as a theatre director and produced numerous plays both in Greece and abroad, as well as operas.

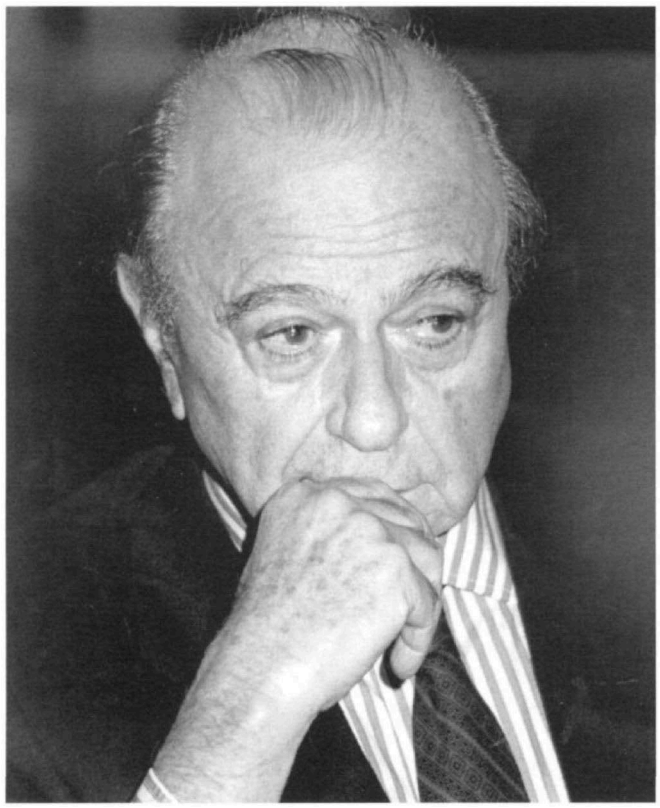
Cacoyannis was born in Limassol, Cyprus, on 11 June 1922. After studying law in Great Britain, Cacoyannis produced programmes for the BBC's Greek-language broadcasts during World War II, while attending the Central School of Dramatic Art (1944). He made his stage debut at London's Old Vic theatre in 1947 in Oscar Wilde's *Salome*, going on to perform in a number of different productions and taking the lead in Albert Camus's *Caligula* (1949). He visited the United States before returning to Greece in 1952, where he directed his first feature film, *Kyriatiko Xypanima* (Getting Up on Sunday, 1954; distributed in the UK as *Windfall in Athens*), which was screened at the Edinburgh Festival. Critical acclaim came with *Stella* (1955); this was followed by *To Koritsime ta Mavra* (*The Girl in Black*, 1956), a film about the tragic consequences of an Athenian writer's love for an island girl, which was made with the cinematographer Walter Lassally who has collaborated with Cacoyannis on many of his features.

Cacoyannis's early films share technical and thematic preoccupations with the European art cinema of the period, and in particular, with Italian neorealism which was introduced into Greece by Grigoris Grigoriou (1919–). The use of location filming and the frustrated hope of a postwar renewal that Cacoyannis's early films express, for example, owe much to postwar Italian cinema. All of them starred little-known actors who were later to build successful acting careers, including Elli Lambeti, Dimitris Horn, Yorgos Foundas, and Melina Mercouri, who made her screen debut with *Stella*. Together with those of Nikos Koundouros (1926–), Cacoyannis's films were the first independent Greek productions to attract international attention.

The script of *Stella*, which is characterized by its intense dialogue, was adapted from the play *Stella with the Red Gloves* by Ioakovos Kambanellis, with a score by Manos Chatzidakis. The action takes place for the most part in the bustling Monastiraki district of Athens and the narrative focuses on the tragic fate of the eponymous heroine (Mercouri), a singer in the bar Paradise, who is condemned for wanting to live in defiance of established moral codes. Cacoyannis's film charts Stella's doomed relationships, first with Alekos (Alekos Alexandrakis), who comes from an affluent bourgeois family in Patissia, and secondly with Miltos (Foundas), a brash football player from Piraeus. The heroine refuses to be pressured into marriage by her lovers and the denouement takes place in central Athens during the Ochi Day celebrations, as Stella goes to watch the parades while her fiancé Miltos waits with the guests in church. A parallel is intimated here between the nation's rejection of the Italian ultimatum and Stella's renunciation of the marriage to Miltos. At the end of the film, however, with Stella's murder by Miltos, the threat of a disrupted social order is quashed. Since the 1970s the character of Stella has been appropriated as a symbol of female emancipation and the film has often been construed as an index of authentic "Greekness", achieving an established position in the canon of Greek cinema.

Many of these social and political preoccupations are taken up again in the melodrama *To Televtaio Psema* (The Last Lie, 1958; distributed in the UK as *A Matter of Dignity*,) which was both written and directed by Cacoyannis and centres on a young Athenian woman's pledge to marry a rich man – in so doing relinquishing her chance of happiness – to save her family from bankruptcy. Like Stella, albeit in very different ways, the film explores social conventions and freedom in a rapidly changing society.

Cacoyannis's best works have been adaptations of plays or novels. In 1959 he produced a version of Kosmas Politis's masterful novel *Eroica* (1937), misleadingly translated into English as *Our Last Spring*. The film follows the adventures of a group of adolescents whose imaginary, heroic world is subdued by death and sexual desire. In 1964 Cacoyannis achieved international fame with the 20th Century Fox (a studio founded by the Greek entrepreneur Spyros Skouras) production of *Zorba the Greek*, starring Anthony Quinn and



Michalis Cacoyannis

Alan Bates and based on the novel by Nikos Kazantzakis (1946). Set to music by Mikis Theodorakis, this remains Cacoyannis's biggest international success, although the film has never been popular in Greece. As Cacoyannis himself has commented sardonically in a recent interview: "I was considered an artist when I made my early Greek films, but when *Zorba the Greek* was cast with Anthony Quinn, a Mexican-American actor, and the film made money, I was considered from then on as a commercial director!" The narrative of *Zorba* centres on an English writer of Greek parentage (Bates) who travels to Crete to claim his inheritance of a lignite mine. While waiting in Piraeus for the ship to take him there he is befriended by the ebullient Alexis Zorba (Quinn), described by the studio publicity as a "life force", who helps him to lose his inhibitions and waken his senses. Subsequently Quinn found it impossible to shake off the image of the extrovert Greek but agreed to act in Cacoyannis's Broadway musical based on the film which ran from 1983 to 1986.

Cacoyannis was to draw upon his theatrical background when he brought ancient drama to the screen for a wide modern audience in his successful adaptations of Euripides' tragedies inaugurated with *Electra* (1962), which starred Irene Papas and which won numerous international awards and an Oscar nomination. This was followed by *The Trojan Women* (1971), which starred Katharine Hepburn and Vanessa Redgrave, and *Iphigeneia* (1977). The films combine close-ups with dramatic long shots, and in so doing successfully balance convincing, poignant characterizations with an imposing mythic orientation.

Cacoyannis's more recent films have been less successful. *Sweet Country* (1986), a feature with an international cast, is based on a novel by Caroline Richards and explores the fate of two women, Eva (Carole Laure) and Monica (Joanna Pettet), during the coup d'état led by General Pinochet in 1973 which overthrew the government of Salvador Allende in Chile; while Eva is caught and tortured, for no other reason than being the secretary of the President's wife, Monica joins the resistance. The comedy *Pano, Kato, kai Plagios* (*Up, Down, and Sideways*, 1993) maps out the frustrations of contemporary Athenian life over a period of 24 hours, focusing on the tensions between Maria, a widow (Papas), her adolescent son Stavros (Stratos Tzortzoglou), and Anestis (Panos Michalopoulos), the man who rekindles her passion. Other films include an Italian feature *Il Relito* (*The Wastrel*, 1961), and the British film *The Day the Fish Came Out* (1967), starring Tom Courtenay, Colin Blakely, and Sam Wanamaker, about the threat of radioactive contamination in the Mediterranean after a military aircraft crashes in the Aegean. The narrative, which is strangely reminiscent of Stanley Kubrick's comic call for disarmament in *Dr Strangelove* (1963), focuses on the efforts of a team of experts (who pose as agents of a hotel development company) to recover stray bombs. Finally, Cacoyannis's documentary *Attila 74* (1975) is a passionate account of dispossession that records the impact of the Turkish invasion of Cyprus in the summer of 1974.

Cacoyannis's last project of the 1990s was a screen adaptation of Anton Chekhov's *The Cherry Orchard*, entitled *Varya* (1999). It was filmed in Bulgaria with the support of the Onassis Foundation and starred Alan Bates and Charlotte Rampling.

Biography

Born in Limassol, Cyprus, in 1922, Cacoyannis studied law in Britain and produced Greek-language programmes for the BBC during World War II. His first acclaimed film was *Stella* (1955); his best-known works are *Zorba the Greek* (1964), which won an Oscar for cinematography and art direction, and film adaptations of Euripidean tragedies. He has directed plays and produced three translations of Shakespeare into Greek as well as English versions of two plays of Euripides.

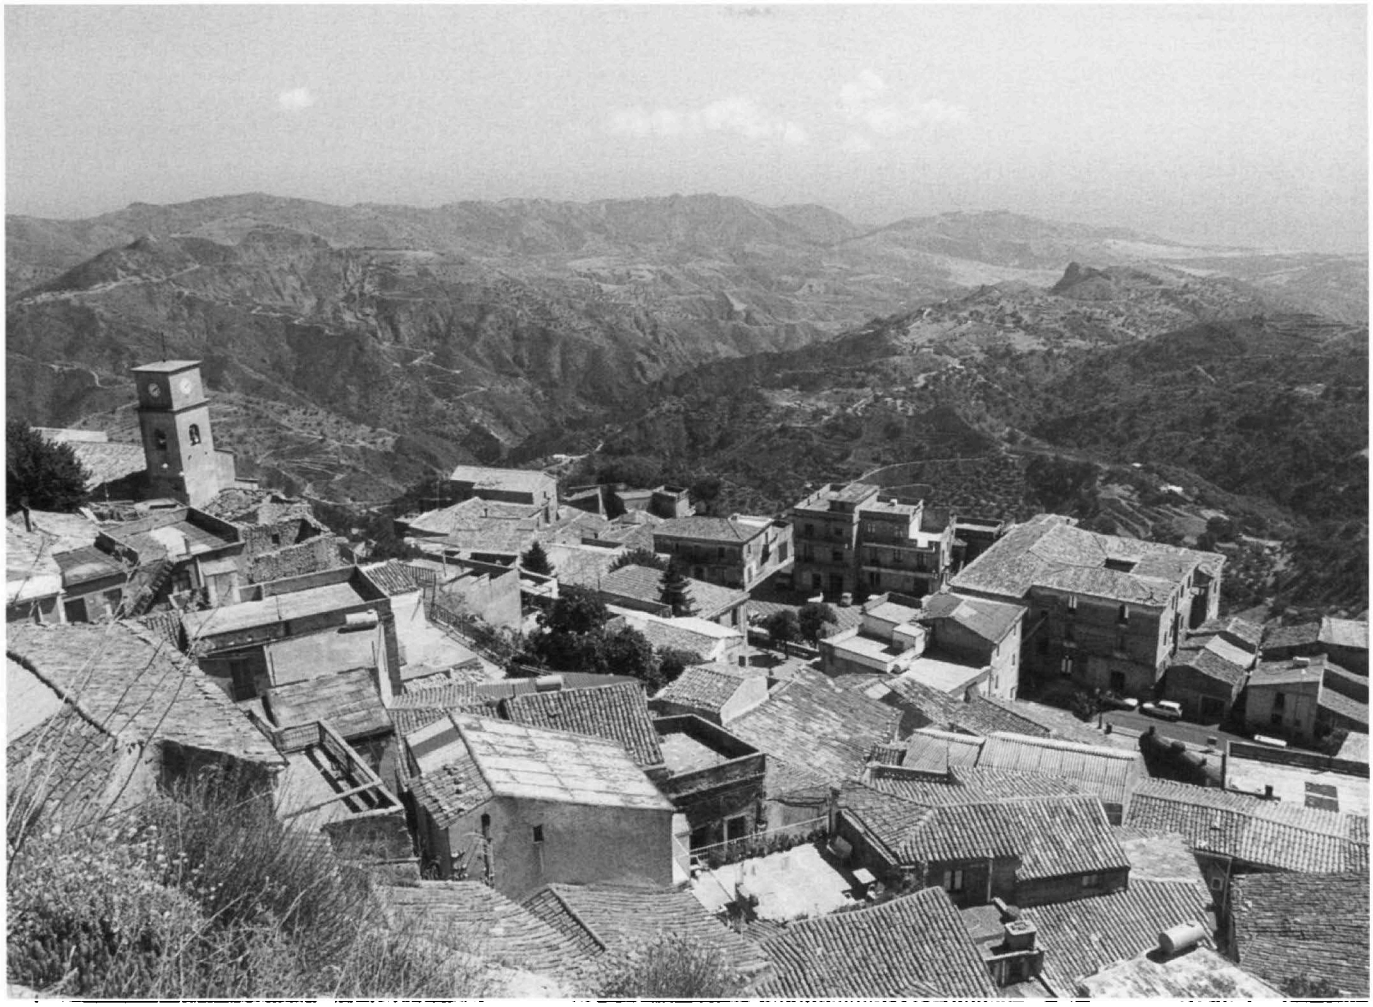
Calabria

Region of southwest Italy

Calabria was colonized by the Greek city states from the 8th century BC. The south Italian colonies constituted "Greater Greece" or, as it is most commonly referred to, Magna Graecia. The establishment of Greek colonies in south Italy and Sicily was only the conclusion of a long period of contacts,



Calabria: the village of Bova, where a Greek dialect is still spoken

from the end of the 2nd millennium BC, between the Greeks of the mainland and the islands, who were seeking new markets, and the indigenous people in Italy. The colonization was extremely successful, especially when compared with the trading settlements of the Phoenician and Carthaginian settlers, which lacked the permanent character of the Greek colonies. The expeditions were led by aristocratic families. There was close cooperation with the mother city, which provided active support for the colony. Rapid economic and cultural development therefore soon followed.

One of the most famous Greek cities was Rhegium (modern Reggio di Calabria), an Ionian colony established by the Euboeans. Many philosophers were associated with the region of Magna Graecia and Calabria in particular, such as Pythagoras who emigrated from Samos to Croton, Timaeus in Locri, Parmenides and Zeno in Elea. The philosophical system of Pythagoras deeply influenced the cultural life of the colonies. Many of his ideas were enhanced by the Orphic cults that flourished in the area. Recent finds of gold coins with incised text found in tombs have increased our knowledge of the influence of the Orphic cult. Modern museums exhibit many traces of a glorious civilization and the archaeological sites are often breathtaking. Two of the most famous ancient statues, the Riace bronzes of approximately the 5th century BC, were found in a shipwreck in 1972 and are now exhibited in the museum of Reggio. Rhegium was important culturally. The sculptor Pythagoras, the poet Ibycus, and the historians Hippys and Glaucus were associated with it.

Locri was a colony established by Dorians from Locris. The poet Xenocrates was associated with Locri; he devised the "Locrian harmony", a new type of musical composition that depended upon flutes rather than lyres. The Hellenistic female poet Nossis was also associated with Locri. She is known to us through some poems in the *Palatine Anthology*, and is believed to have written mainly epigrams in the sapphic metre. Ruins of an Ionic temple have been found near Locri, as well as a site associated with the cult of Persephone. Temples in the Ionic style are rare in Magna Graecia, where the Doric style prevails. A common feature of many cities in the area is the extramural sanctuary, such as the Heraion near Croton. Caulonia was a colony established by Locri that was destroyed in the wars between Pyrrhus and the Romans.

The region was conquered by the Romans by 212 BC and the cultural map changed significantly in the following centuries. Under Diocletian (AD 284–305) Calabria and Apulia formed one province, and until the 7th century the name Calabria designated all of southern Italy. There were major political and social upheavals in the area in AD 476 and

towards the end of the western Roman empire. Until the first half of the 7th century the regions of south Italy (Bretia and Basilicata) constituted an eparchy directly dependent on the exarchate of Ravenna. The 7th century is important for Hellenic culture in the area, because this was when the first wave of immigrants came from Cappadocia, Syria, and Egypt. Also, due to the Islamic incursions on the eastern frontier of the empire, monks were taking refuge in Calabria and Sicily where they could practise true ascetism, especially in the mountains. In the 8th century Calabria became a *doukaton* (dukedom), dependent on the *strategos* (commander) of Sicily, which had been elevated to a Byzantine theme. Following the monastic immigration that came from the east, many monks came from the Greek mainland due to the religious turbulence associated with iconoclasm, especially after the edicts of Leo III. The foundation of monasteries also meant the establishment of Greek cultural centres.

The conquest of Sicily by the Arabs reshaped the south Italian world in the first half of the 10th century and persuaded the emperor Nikephoros Phokas to reorganize the administration of the empire. Religious matters also intervened, and became extremely important in view of the ongoing struggle between East and West. The Greek rite was imposed in all the churches of south Italy that belonged to the theme of Calabria, Lucania, and Longobardia (modern Puglia). Since Sicily was mainly in the hands of the Arabs, there was more immigration into Calabria, and that included the Sicilian monks. On the other hand, the Byzantine presence was not always well received by the local people due to the heavy taxation that was imposed on them, since it was an important region from a strategic point of view, and a large armed force had to be sustained in the area. The Normans occupied Calabria in 1040. Although there were still many Greek influences in customs, culture, and ecclesiastical matters, a gradual distancing started, and the Latin rite was gradually imposed in churches.

Trade continued with the Byzantines, and many monasteries were built in the following years. Calabria became an important refuge for scholars from the east, such as the monk Barlaam (*c.*1290–1350), and there was a significant circulation of Greek texts. Palaeographers identify a peculiar calligraphic style in many manuscripts as the Reggio script.

Today in the area of Aspromonte there are several villages where a distinctive Greek dialect is still spoken, mingled with many Italiot elements. There are various views as to the origin of this dialect, which is not quite the same as the one spoken in Puglia and the area of Salento, and often differs among villages of the same region. Many scholars argue that its origin is ancient Greek, others that it is Byzantine Greek, adducing many historical reasons related to the political turbulence in the area in the Middle Ages. The villages in which one finds Hellenophones today are Bova, Bova Marina, Condofuri, Amendolea, Roghudi, and Galliciano. There is a rich linguistic, literary, and musical Hellenic tradition that has shrunk significantly in modern times.

Calendar

Most ancient Greek states had their own individual calendars, often more than one for different purposes (e.g. civil and religious) as in many countries today (e.g. civil, religious, financial, scholastic). Like all calendars, the Greek suffered from the incommensurability of the units commonly used – solar day, synodic month, and tropical year. The solar day is the slightly variable period between successive apparent passages of the sun around the earth, and was usually taken to commence at sunset. The synodic month is the substantially variable period of a single cycle of the moon's phases as seen from the earth, and was deemed to commence with the appearance of the crescent of the "new moon". The tropical year is the period between successive passages of the sun across the celestial equator in March (the vernal equinox), although the dates of its commencement were extremely varied. The week of seven days, possibly inspired by Babylonian hebdomadism, entered the Graeco-Roman world from the Jews only in the 1st century BC, at the end of which the practice of naming its days for the planets, as found in most European languages today, was already being established (the Hebrew numbering of the days, however, persisted in Greek).

All ancient Greek calendars were originally, and most remained largely, lunar. Months were named after festivals or deities and one was intercalated periodically to achieve approximate correspondence with the solar year. Most surviving calendaric information relates to Athens, which used an astronomically controlled lunar calendar; a festival or archon's

lunar calendar (which through manipulation for political and religious reasons (mocked by Aristophanes in *Clouds*, 615–26) was often seriously at variance with the former); and a "prytany" calendar (used in dating governmental documents) which was based upon the annual presidential terms of the ten tribes in the *boule* (council). The years of the first two calendars were divided into 12 months of 29 or 30 days with a month being repeated when deemed necessary. The first day of each month was called the "new moon"; the next nine were numbered forwards as the "2nd to 10th of the waxing month", and the next nine simply as the "11th to 19th"; the 20th and 21st were called respectively the "20th" or the "earlier 10th" and the "10th of the waning month" or the "later 10th"; the 22nd to 28th were counted backwards as the "9th to 3rd of the waning month"; and the last day of the month was called "the old and the new", leaving the 29th in a 30-day month to be the "2nd of the waning month". Years were named after the eponymous archon (and in other states after other officials, priests, etc.). For the later numbering of years in a series, i.e. eras, see the article on Chronology.

Greek calendaric reform based upon cycles of years was made possible by the astronomical discoveries beginning in the 6th century BC with the sphericity of the earth, the obliquity of the ecliptic, etc. and, in the 4th century, by the theory of Eudoxus (which was refined by Callippus) of sun, moon, and planets moving in concentric spheres around the earth. Thus sometime before 432 the cycle of the *octaeteris* (cycle of eight years) was worked out by which the intercalation at intervals of three 30-day months during a period of eight lunar years made the period roughly synchronous with eight tropical years. The famous reform of Meton and Euctemon at Athens in 432 (of which not all the details are known) devised a more accurate cycle of 19 tropical years and 125 30-day ("full") and 110 29-day ("hollow") months. Around 100 years later Callippus proposed a cycle of 76 years which is one day shorter than four of Meton's cycles and thus accords more closely with astronomical phenomena. Later cycles of 2484 years (Aristarchus, who hypothesized heliocentricity) and 304 (Hipparchus) are also known, but, with the exception of the *octaeteris*, there has been much debate as to what extent any were used for civic as opposed to astronomical purposes.

In Greece itself states largely kept their own calendars into the early Roman period, some even persisting with the *octaeteris* until as late as *c.*AD 200. The conquests of Alexander, however, introduced over much of the eastern Hellenized world the Macedonian calendar of a year of 12 followed by a year of 13 lunar months, although this gave an excess of about seven days over a period of two solar years. The Greeks in Egypt, however, adopted the local calendar and the Seleucids adapted the Macedonian to the Babylonian.

Since by the mid-1st century BC the partly lunar Roman Republican calendar was substantially and increasingly out of phase with the seasons, Julius Caesar, in his capacity as Pontifex Maximus (chief priest), invited the Greek astronomer Sosigenes of Alexandria to advise on a new calendar, which was instituted in 46 BC and became known as the Julian calendar. Sosigenes first intercalated 67 days in addition to the regular biennial intercalation of 23 days (or 22 alternately in a quadrennial cycle) after 23 February, and then, to preclude a repetition of the Republican problem, proposed the adoption of a tropical (solar) year of 365.25 days. For practicality three years were to be of 365 days' duration with an extra day intercalated (between 23 and 24 February) every fourth year. However, because of confusion caused by Roman inclusive reckoning this was done every third year until the situation was gradually righted under Augustus between 9 BC and AD 4, by which time the months had been given their present number of days. The revision of this calendar, known as the Gregorian calendar, appeared in a papal bull of Pope Gregory XIII in 1582. By it the first three centennial years in every sequence of four are not bissextile (leap) years, since the true length of the tropical year (365.242199 mean solar days) puts the Julian Calendar approximately seven days behind the seasons every 1000 years.

The Byzantines largely used the Julian calendar, but with the days of the month numbered successively (rather than by Kalends, Nones, and Ides) and with the year beginning on 1 September, the traditional date for the beginning of an indiction (period of 15 years when annual tax was to remain unaltered). However, consular years (used until the 7th century for public and legal documents) still began on 1 January, while regnal years, patriarchal years (Constantinopolitan, Alexandrian, Antiochian, and Ierosolymite), papal years, and those of officials such as the praetorian prefect began upon accession or appointment. The problem of calculating the date of Easter begat a cycle of 532 years, the product of a 19-year lunar and a 28-year solar cycle, which gave precisely recurring Julian dates for the festival and its associated holy days. These cycles, with the rules for calculation, form the *computus*, tables from which survive in many manuscripts. The Church calendar was a combination of the Synaxarion, a list of calendarically fixed feasts and saints' days (often given separately with appropriate lections) and the Kanonarion, a list of the mobile Paschal feasts.

During the Tourkokratia Greeks were permitted to keep their civic and religious calendars. The modern state made the decision to change to the more astronomically correct Gregorian calendar in 1923, 16 February becoming 1 March, and the Greek Church swiftly followed, 10 March becoming 23 March. Nevertheless, outside the national Church there are still communities ("Old Calendarist") which abide by the Julian calendar, as do the monasteries of Mount Athos, where the day, itself divided into 12 hours of night and 12 of daylight, begins at sundown (except for Iviron which starts its day at sunrise).

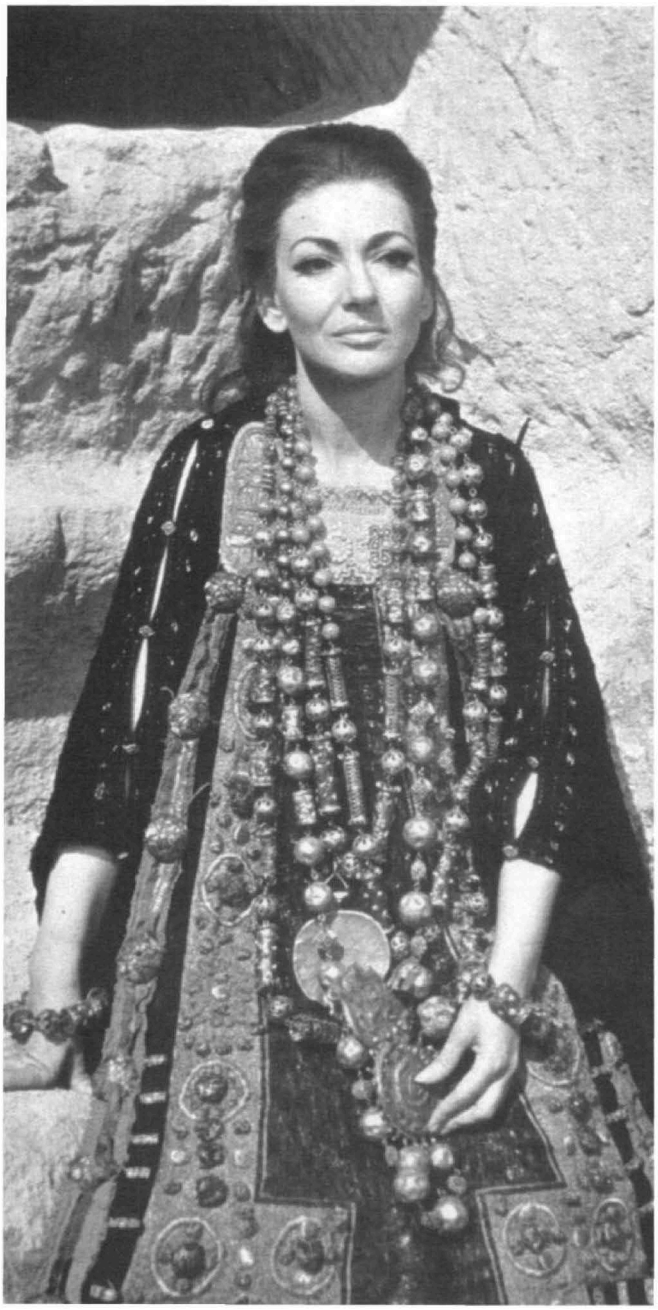
Callas, Maria 1923–1977

Opera singer

Born on 2 December 1923 in New York and trained in Athens, Cecilia Sophia Anna Maria Callas went on to become one of the outstanding operatic sopranos of the 20th century. She was the second daughter of George Kalogeropoulos, a pharmacist from Meligala in the Peloponnese, and Evangelia Dimitroadou, the daughter of a military officer descended from prosperous Phanariots. The family surname was shortened to Callas when her parents emigrated to the United States several months before her birth, in what may have been an attempt to revitalize a marriage shaken by the recent death of their only son, Vasily. Unfortunately, the strains of immigrant life and financial difficulties, later compounded by the onset of the Great Depression, brought only further discord to the couple. Maria (or Mary, as she was then known) and her older sister Jackie (Iakinthy) were thus raised in an environment marked by constant bickering. Significantly, these marital disputes extended to music, reflecting in microcosm the cultural struggles that were being played out at that time in Greece. George preferred to listen to gramophone records of *rebetika* ("low-life" music) which his wife, whose musical tastes and cultural pretensions were those of the contemporary westernizing Greek bourgeoisie, would promptly disparage and replace with recordings of opera. Evangelia would also regularly listen to radio broadcasts from the Metropolitan Opera with her daughters, upon whom a substantial portion of the family's meagre financial resources were bestowed at her insistence for music lessons. Both girls studied piano, and Mary sang at school, in church, and, at her mother's behest, in radio competitions. In 1937 Evangelia separated from George and returned to Greece with the children, citing a desire to advance their musical careers.

In Athens Evangelia eventually managed to arrange an audition for her daughter Maria with Maria Trivella, a teacher of singing who secured a scholarship for her at the National Conservatory of the composer Manolis Kalomiris. Proving herself to be a determined and dedicated pupil, Maria Callas progressed rapidly and on 2 April 1939 she made her operatic debut as Santuzza in a student production of *Cavalleria Rusticana*. Emboldened by this achievement, Maria's mother presented her for an audition before Elvira de Hidalgo, a Spanish soprano of international stature who had come to Greece to teach at the more prestigious Athens Conservatory. Hidalgo was sufficiently impressed to arrange a full scholarship for her at the Athens Conservatory, where she sang in numerous concerts with the soprano Arda Mandikian and other students. Callas was hired by the Royal Theatre in 1940 and early in the next year (probably in February) she made her professional debut in the minor role of Beatrice in von Suppé's operetta *Boccaccio*. During the Axis occupation (1941–44) she graduated to leading roles with the Athens Opera while continuing to appear in concerts and recitals, albeit somewhat sporadically because of the adverse conditions. On 27 August 1942 she made her first appearance as Tosca, a role that she would sing to great acclaim towards the end of her career. She went on to sing in Athenian productions of *Cavalleria Rusticana*, *Fidelio*, d'Albert's *Tiefland*, and *O Protomastoras* by Kalomiris, the only modern Greek opera she was ever to sing. After the liberation of Greece she continued to appear on the operatic and concert stages, but the refusal of the Athens Opera to renew her contract – a decision variously attributed to the jealousy of more established singers and accusations of collaboration with the occupiers – caused her to return to New York in September 1945 after her final appearances as Laura in Millöcker's operetta *Der Bettelstudent*.

Unable to advance her career sufficiently in America, Callas accepted an offer to sing the title role in Ponchielli's *La Gioconda* at the Arena in Verona, where she first performed on 2 August 1947 under the direction of Tullio Serafin. This successful appearance led to increasingly frequent engagements



Maria Callas: a still from Pier Paolo Pasolini's film *Medea* (1970), in which Callas took the title role

in Italy, Mexico, and South America to sing a wide variety of operas by Italian and German composers. Although initially prized for her dramatic interpretations of Aida, Isolde, Kundry, Brünnhilde, and Turandot, Callas soon abandoned heavy roles on Serafin's advice. She thereafter became known as a supreme interpreter of Italian operas from the later 18th to the mid-19th century, including works by Gluck, Haydn, Cherubini, Spontini, Bellini, Donizetti, and Verdi. Only after she had made her debut on the world's most prestigious operatic stages – for example, La Scala (12 April 1950), Covent Garden (8 November 1950), the Chicago Lyric Theatre (1 November 1954), and the Metropolitan (29 October 1956) – and had become an international celebrity was she engaged by the Athens Festival to sing in two concerts at the Herodes Atticus Theatre in August 1957. Despite political wranglings over the size of her fee and vocal troubles that caused her to cancel the first of these appearances, on 5 August Callas scored an artistic triumph over an initially hostile audience and thereafter began to renew her artistic and personal ties with Greece. At her suggestion, the new Dallas Civic Opera production of Cherubini's *Medea* was premièred on 6 November 1958 with direction by Alexis Miniotis of Greece's National Theatre and design by Ioannis Tsarouchis. In addition to helping to mount over the next four years further stagings of *Medea* at Covent Garden (1959), Epidaurus (1961), and La Scala (1961–62), Miniotis and Tsarouchis collaborated with Callas on the Greek National Opera's performances in August 1960 at Epidaurus of *Norma*, the first opera ever mounted in that ancient theatre. Callas, who donated the fees for all of her 1960 and 1961 Epidaurus engagements to a scholarship fund for poor singers, was given awards by the city of Athens and the government of Greece officially recognizing her contributions to art.

During the early 1960s Callas gradually withdrew from the operatic stage as her longstanding vocal troubles increased and her private life became centred on a relationship with the shipping magnate Aristotle Onassis. On 5 July 1965 she made her final operatic appearance as Tosca at Covent Garden, after which she made occasional recordings, gave infrequent concerts, starred in a non-operatic film of *Medea* directed by Pasolini, and led master classes. After completing a punishing two-year recital tour in 1974, she retired completely from public life and died in Paris on 16 September 1977.

Notwithstanding the relative brevity of her international career, the voice and personality of Callas have remained intensely fascinating to opera lovers and the general public, causing her to achieve near mythic status after her death. Her artistic work and glamorous life have been documented in exhaustive detail through numerous books and recordings. Most recently, she has begun to inspire authors both in Greece and abroad to create fictional accounts of episodes in her life, including Terrence McNally's play *Masterclass* and *Thymamai ten Maria* (I Remember Maria) by Menes Koumantareas, a short story describing how a young bellboy from Corfu heard Callas sing during her stay at the Grand Bretagne Hotel in 1957.

Biography

Born in New York in 1923 to parents who had just emigrated to the USA, Callas returned to Greece with her mother in 1937. She won a scholarship to the Athens Conservatory in that year and made her professional operatic debut in 1940. She moved to New York in 1945, then back to Europe in 1947, and throughout the 1950s enjoyed international stardom. She gradually withdrew from performance in the 1960s and died in Paris in 1977.

Callimachus *c.*320 BC–*c.*240 BC

Poet and scholar

Callimachus was one of the foremost literary scholars of the Hellenistic age and its most important poet. He produced an impressive array of works in prose and verse (the *Suda* ascribes more than 800 books to him, only a very small proportion of which has been preserved). Ingeniously taking up and reacting to earlier poetry, he became the very model of the *poeta doctus* for centuries to come.

Few details of Callimachus' life are known. He was born probably around 320 BC to a noble Cyrenean family. He may early on have had a position at the Ptolemaic court in Alexandria and could have attained his high standard of education at no better place than this. He spent long periods of his life in Alexandria and was intimately connected with its magnificent museum and royal library (both founded by Ptolemy I). Some other facts reported about him are probably fictitious: the *Suda*'s statement that he was at first a lowly schoolteacher is probably the product of slanderous invention, and the evidence for his supposed feud with his (somewhat younger) contemporary Apollonius Rhodius is late and shaky (e.g. the identification of Apollonius with the target of

Callimachus' curse-poem *Ibis*). Callimachus died probably around 240 BC.

Since dates for Callimachus' wide-ranging oeuvre are almost non-existent, it is best to present his work according to genre, following the order of the *Diegeseis* (summaries of his poems) preserved on papyrus (see below).

Callimachus' most famous poetic work is the *Aetia*, a collection of stories in four books relating the cause (*aition*, hence the title) and origin of certain peculiar customs and phenomena in the Greek world. Thanks to surviving papyri, this substantial work (possibly up to 6000 verses in elegiac couplets) can be reconstructed to a large extent. In the first two books (probably completed by 270 BC), the stories were framed by a conversation that Callimachus himself had (in a dream) with the Muses on Mount Helicon (a programmatic reminiscence of Hesiod). Books 3 and 4 were probably added considerably later (after 246 BC); they do not follow the narrative frame of the earlier books but consist of a collection of aetiological stories, the first and the last of which honoured Queen Berenice II, the wife of Ptolemy III Euergetes, thus providing a frame. At the beginning of book 3 the *Victoria Berenices* celebrates – in Pindaric fashion – the queen's chariot victory at the Nemean Games and gives the tale of the games' *aition*, Heracles' slaying of the Nemean Lion, told from a typically Callimachean angle. On his way to the fight, the hero spends the night in the lowly dwelling of the poor peasant Molorcus; this domestic setting was probably much more developed than Heracles' fight itself. Book 4 ends with the *Coma Berenices*, the tale of the lock of hair that the queen dedicated for the safe homecoming of Euergetes (who had gone to war in Syria); the lock vanished and was miraculously rediscovered in heaven as a new star (the charming story can still be read in Catullus' Latin translation). Another famous story (in book 3) is that of Acontius and Cydippe, admired and imitated in Latin (by Virgil, Propertius, and Ovid) as well as in later Greek literature (e.g. in the *Letters* of "Aristaenetus"). The most important – and most widely quoted – part of the *Aetia* was the prologue, which (contrary to what earlier scholars have surmised) was already the introduction to its original two books. In it Callimachus vividly and vehemently rejects the carpings of the Telchines, as he calls his critics (the name originally signified some malevolent spirits), who demand from him heroic epics on a massive scale; but he cites the well-crafted small-scale poems of Mimnermus and Philitas as his models and claims that from his very beginnings as a poet Apollo himself advised him to seek out yet untrodden poetic paths.

The epilogue at the end of the *Aetia* evokes the next category of Callimachus' poetry, the thematically and metrically very diverse *Iambi*, which adopt the tradition of the old Ionic iambus (and especially the work of Hipponax), as the *Aetia* took up Hesiodic catalogue poetry. In six of the *Iambi* (1–5 and 13) he adopted Hipponax' trademark metre, the "limping iambic"; in the rest he used a variety of other metres. In *Iambus* 1 Hipponax himself speaks; he is "on holiday" from Hades and now admonishes – of all people – the scholars of Alexandria (Callimachus' colleagues) to cease squabbling with each other; he then pointedly relates how magnanimously the Seven Sages behaved among themselves. *Iambus* 2 tells an Aesopian fable with satirical application at the end. *Iambus* 3 laments present bad times. *Iambus* 4, another fable about the contest between the laurel tree and the olive tree that is interrupted by a neighbouring bush, is apparently connected to the framing story, in which a quarrel between Callimachus and a rival is similarly interrupted by a third person. In *Iambus* 5, in metaphorical language, the poet advises a pederastic schoolteacher not to pursue his vice any further. *Iambus* 6 offers a detailed (but badly preserved) description of the great statue of Olympian Zeus, apparently given by the poet to a friend who is about to visit Olympia; this is an intriguing mixture of a *propemptikon* (a farewell poem) and a traveller's guide. *Iambus* 7 gives an aetiological story about the wooden statue of Hermes Perpheraeus (told by the statue itself). Of *Iambi* 8–11 only a few verses remain, but we know their content from the *Diegeseis*: a victory ode in iambic trimeters containing another aetiological tale (8), a conversation between a statue of Hermes with erect phallus and a pederast (9), an *aition* for a curious pig sacrifice to Aphrodite (10), and an *aition* for a proverb (11). *Iambus* 12 returns to more poetical spheres. In this birthday poem for the newborn daughter of a friend the poet related how, when a similar feast was once celebrated on Olympus for the newborn Hebe, Apollo's hymn was judged the best among the presents then given; surely Callimachus himself wanted his own birthday poem to be judged similarly. In *Iambus* 13 Callimachus defended himself against critics carping at the diversity and multiformity of his poems. This could have been a fitting conclusion to the collection; recently, though, it has been argued that the book of *Iambi* did not only contain the 13 poems described above, but also the four following miscellaneous poems in various lyrical metres, as the *Diegeseis* do not really distinguish them from the preceding *Iambi* (Cameron, 1995, pp. 163–70).

The *Hecale* is Callimachus' response to Greek epic tradition; in this epyllion (little epic) he chooses – as in the Heracles story in the *Victoria Berenices* – a characteristically unexpected angle to retell a deed by the young Athenian hero Theseus. Having just escaped an assassination attempt by the sorceress Medea, Theseus is forbidden by his father Aegeus to seek a new danger and slay the mighty bull that ravages the Marathonian countryside; he ventures out nevertheless and, when surprised by a heavy downpour, finds hospitable refuge in the hut of a poor old woman, Hecale (and Callimachus describes this domestic scene with loving detail). Next day Theseus successfully captures the bull (this, it seems, was described only very briefly), but on his return finds the old woman dead; so he sacrifices the bull in her memory, and founds a new Attic deme, which he names Hecale, and a sanctuary to Zeus Hekaleios as well. The latter part of the poem is filled out mainly by the curious conversation between an old crow (which deeply delves into Athenian mythical history) and another bird (possibly an owl). The whole poem may have been 1000 to 1500 hexameters long.

The six *Hymns* to various deities, which take their cue from the so-called *Homeric Hymns*, are the only substantial part of Callimachus' poetry (except the *Epigrams*) to be preserved in medieval manuscript tradition. *Hymns* 1 (*To Zeus*), 3 (*To Artemis*), and 4 (*To Delos*; the island is divinized as the birthplace of Apollo) are written in a straightforward fashion. *Hymn* 3 especially contains scenes pervaded by typically Callimachean humour: little Artemis reaches in vain for her father's bearded chin and pulls hairs from the shaggy breast of

the Cyclops Brontes, and when – after a hunting foray – she is welcomed on Olympus by Heracles, this well-known lover of great quantities of meat earnestly tells her not to hunt little hares but bigger animals like boar and oxen! *Hymn* 4 wittily includes an honorific mention of Ptolemy Philadelphus by way of a curious prophecy (162–95): when Leto approaches the island of Cos, Apollo, speaking from her womb, forbids her to bear him there, for this island is destined to become the birthplace of another god (Philadelphus). The other three *Hymns* are set within the frame of a ritual which is evoked by the poet's very words. *Hymn* 5 (*To the Bath of Pallas*), which unlike the other hymns is written in elegiac couplets and Doric dialect, unfolds within a ritual bathing scene for a statue of Athena; within this frame another (mythical) bath of Athena is described which cost Tiresias (who had inadvertently stumbled on the scene) his eyesight for seeing the bathing goddess. *Hymn* 6 (*To Demeter*, again in Doric dialect) within its ritual frame tells how Demeter punished Erysichthon for destroying her sacred trees by striking him with eternal hunger (which is then described in lurid and ludicrous detail). *Hymn* 2 (*To Apollo*) evokes the epiphany of the golden, youthful Apollo and ends with a peculiar section leading us back to Callimachus' convictions regarding poetry (105–12): Phthonos (personified Envy) approaches Apollo and whispers into his ear that he does not love poets who do not produce works on the scale of the sea, but Apollo kicks him away and declares his own preference for the clear and pure water of the modest fountain to the mighty, but muddy, Assyrian stream.

Of Callimachus' *Epigrams* about 60 have survived, almost all of them in the *Anthologia Palatina*. In an age famous for gifted epigrammatists, these little poems (rarely exceeding six lines) still hold their own for the strength of feeling that they express and the unexpected turn of thought that they often take.

Callimachus was as much a scholar as a poet, but of the astonishing amount of prose works he produced even more has been lost than of his poetry. According to the *Suda*, he wrote, among other things, *On the Names of the Months according to Peoples and Cities*, *The Settling of Islands and Cities and their Renaming*, *On Winds*, *On Birds*, *On the Rivers in the Inhabited World*, and *Collection of the Carvels of all the World according to Localities*. His greatest achievement as a scholar, however, was surely the *Pinakes*, or *Tables of Those who Distinguished Themselves in All Kinds of Learning and of their Writings*, a gigantic catalogue (in 120 books) which presented the contents of the great royal library in Alexandria ordered by genre, author, and single works.

Both as a scholar and as a poet Callimachus had far-reaching influence. The great Alexandrian scholars Eratosthenes and Aristophanes of Byzantium were his pupils, as were a number of lesser ones (Hermippus of Smyrna, Istrus, and Philostephanus). In the realms of poetry, the *Aetia* and *Hecale* acquired immediate and lasting fame. The *Aetia* secured Callimachus a place among the foremost elegiac Greek poets; echoes from the *Hecale* can be found in many Greek as well as Roman poets. In Hellenistic times Callimachus' presence could be felt in the works of Apollonius Rhodius, Lycophron, Rhianus, Eratosthenes, Euphorion, Nicander, and Parthenius; in imperial times in that of Dionysius Periegetes, the two Oppians, Quintus of Smyrna, Triphiodorus, the Christian Gregory of Nazianzus, and Nonnus (both in the *Dionysiaca* and in the poetic paraphrase of St John's Gospel). In the little Egyptian village of Oxyrhynchus alone, papyrus fragments of nine separate copies of the *Hecale* have been found (ranging from the 2nd to the 6th or 7th centuries AD).

As Callimachus' poetry was never easy, even for native Greek-speakers, his works soon needed clarification. Perhaps as early as the final centuries BC the so-called *Diegeseis* (one might call them "Tales from Callimachus") were produced; largely preserved on papyrus, they provide valuable information on the content of Callimachus' work. Commentaries on Callimachus' poetry are known to have been written at least since the end of the 1st century BC: Theon, a scholar of Augustan times, and Epaphroditus (1st century AD) wrote commentaries on the *Aetia*; Archibius, the son of Apollonius, on the *Epigrams*; and Salustius (late antiquity) on the *Hecale* and perhaps other poems; this commentary was still used by Byzantine lexica (see below). Around AD 500 Marianus of Eleutheropolis produced a paraphrase of the *Hecale*, *Hymns*, *Aetia*, and *Epigrams* in 6810 iambic lines. The *Hecale* was cited by Archbishop Arethas (active in the late 9th/early 10th century), who also knew the *Aetia* and the *Hymns*; by the *Etymologicum Genuinum* (which, though itself lost, spawned various other *Etymologica* in the following centuries) in the 9th century and by the *Suda* (our most important source for the *Hecale* fragments apart from the papyri) in the 10th. The owner of the last known copy of *Hecale* (and probably *Aetia*) was Michael Choniates, metropolitan of Athens (1182–1204). This copy, however, in all likelihood perished when Athens was sacked by members of the Fourth Crusade in 1205. It was not until the 20th century that papyri would restore at least a part of what had been lost 700 years ago.

HEINZ-GÜNTHER NESSELRATH

Biography

Born *c.*320 BC in Cyrene, Callimachus was probably educated in Alexandria and lived there for much of his life. He was closely connected with the Museum and the royal library. He wrote extensively in poetry (*Aetia*, *Iambi*, *Hymns*, *Epigrams*) and prose (most notably the *Pinakes*, a catalogue in 120 books of the library's collections). His pupils included Eratosthenes and Aristophanes of Byzantium. He died *c.*240 BC.

Writings

Callimachus, edited by Rudolf Pfeiffer, 2 vols, Oxford: Clarendon Press, 1949–53

Hymns and Epigrams, translated by A.W. Mair, London: Heinemann, and Cambridge, Massachusetts: Harvard University Press, 1955 (Loeb edition)

Callimachus, translated by C.A. Trypanis and Thomas Gelzer, Cambridge, Massachusetts: Harvard University Press, and London: Heinemann, 1975 (Loeb edition)

Hymn to Zeus [First Hymn], introduction and commentary by G.R. McLennan, Rome: Ateneo & Bizarri, 1977

Hymn to Apollo [Second Hymn], commentary by Frederick Williams, Oxford: Clarendon Press, and New York: Oxford University Press, 1978

Iambi, edited by D.L. Clayman, Leiden: Brill, 1980

In *Supplementum Hellenisticum*, edited by Hugh Lloyd-Jones and Peter Parsons, Berlin: de Gruyter, 1983, pp. 89–144

Hymn to Delos, translated by W.H. Mineur, Leiden: Brill, 1984

Hymn to Demeter, edited by N. Hopkinson, Cambridge and New York: Cambridge University Press, 1984

The Fifth Hymn, edited by Anthony W. Bulloch, Cambridge and New York: Cambridge University Press, 1985
Hecale, edited by A.S. Hollis, Oxford: Clarendon Press, and New York: Oxford University Press, 1990 (includes commentary)
Aitia, Libri Primo e Secondo, edited and translated into Italian by Giulio Massimilla, Pisa: Giardini, 1996 (includes commentary)

Canada

The first Greek to visit Canada may have been the Cephalonian navigator Apostolos Valerianos, otherwise known as Yannis Phokas, who in the employ of the Viceroy of Mexico explored the Pacific coast of the Americas in 1592 and for whom the Strait of Juan de Fuca, which separates Vancouver Island from the state of Washington, was later named. Although he was preceded by a few fellow-countrymen along the shores of the Saint Lawrence in eastern Canada, the first Greek immigrant of any importance was the soldier of fortune George Kapiotis from Cyme in Euboea, who fought for the British in the Crimean War, joined the gold rush to the Caribou in the early 1850s, and settled in Victoria where he married a local Songhee chief's daughter whom he taught Greek (their grandson, the physician George Athans, was a Canadian champion diver who competed at the Olympics of 1936). By 1900 there were still fewer than 300 Greeks in Canada, almost exclusively males from the poorer areas of Greece such as Arcadia, Laconia, and the islands, who had arrived usually with the intention of making money and returning to Greece rather than settling permanently. The rate of immigration increased in the early decades of the 20th century because of poverty and political persecution in Greece and the Canadian need for cheap labour, but immigration policies biased against southeastern Europeans still kept the numbers low, there being even by 1931 only 9450 persons of Greek origin in the country. A postwar change of immigration policy led to an influx of Greeks in the 1950s to mid-1970s with a peak of over 10,000 in 1967, but growing unemployment in Canada ensured only a trickle in the 20 years up to 1998. According to the 1991 census there were 151,150 people in Canada claiming single Greek descent and 40,330 claiming part-Greek descent, with only a slight preponderance of males, but these figures are probably too low. Approximately 30,000 were Greek Cypriots, whose immigration began in the 1960s and reached its peak with the Turkish invasion of the island in 1974.

Although most immigrants were peasants and fishermen, they largely chose to live in cities, especially Toronto, Montréal, and Vancouver. In 1991 55 per cent resided in Ontario and 29.5 per cent in the province of Québec. The men worked at first mainly in labouring jobs and then increasingly in their own businesses, of which in 1951 about 80 per cent were restaurants (which frequently offered Canadian rather than Greek food). The young women worked at first as domestic servants and later as partners in their husbands' businesses. Since second-generation Greek Canadians had on average more than twice as many years of schooling as their parents, so many entered higher-paying occupations, and especially the professions of teaching, law, engineering, and medicine, that in the late 1990s retiring restaurateurs were finding it difficult to keep their businesses in the family.

The first Greek Orthodox priest in Canada, Agathadoros Papageorgopoulos, came to Montréal in 1906 from Greece, although he was theoretically under the Ecumenical Patriarchate, and from 1908 to 1922 the communities were under the spiritual care, rather than effective jurisdiction, of the Church of Greece. In 1922 Meletios, in his first official act as the new ecumenical patriarch, created the archdiocese of North and South America, which he had begun to organize on a visit the preceding year. The Canadian parishes, originally incorporated into the diocese of Boston, were formed into a separate diocese with the installation of bishop Athenagoras Kokkinakis in 1960. A further reorganization in 1996 saw the enthronement on 26 September of Canada's first archbishop, Sotirios Athanasoulas, under the direct jurisdiction of the Ecumenical Patriarch. By May 1998 there were 65 parishes (although no bishoprics had yet been created) and it was planned to open a seminary in Toronto later that year. A very few small Old Calendarist communities had been established in Canada since the 1960s, and a small but growing number of parishes of other Orthodox Churches such as the Antiochian catered largely for second-generation Greeks and their often non-Greek families who both needed the liturgy in English and wished to escape Greek cultural domination. Since the late 1940s the traditionally wide-reaching and often authoritarian role of the Church in community affairs was increasingly challenged, and often acrimonious struggles developed between the clergy (born mainly in Greece) and secular leaders. Among the factors involved were the influence of the generally more secular Canadian society, the immigration of many communists persecuted in Greece at the end of the Civil War in 1949, and the Church's support of the junta in Greece from 1967 to 1974.

The small numbers of Greeks in Canada always encouraged the creation of tightly knit communities within the cities. In the 1970s and 1980s the federal government's deliberate fostering of multiculturalism further aided a sense of ethnic distinctness. Greek schools, for the teaching of the history and the modern language, proliferated. Increasingly under lay direction, these have operated in the evenings and on Saturdays, but have rarely catered for children over the age of 14. Cultural, sporting, and philanthropic associations, some purely local, many provincial or national or affiliated with US groups, have been sponsored both by the Church and by the secular communities (the first were in Montréal as early as 1906). In 1981 the Hellenic Canadian Congress was founded as an umbrella organization largely to give these associations a more effective voice in dealings with different layers of government. In 1998 there were approximately 12 Greek newspapers in Canada, the earliest having appeared in Montréal in 1924. Greek television and radio programmes have been based mainly in Toronto and Montréal. Although these factors have all promoted ethnic

awareness, Canadian state schooling, the low level of Greek immigration in the 1980s and 1990s, and the growing tendency of young Greek-Canadians to practise exogamy had already begun to break down ethnic barriers and produce something more akin to the "melting-pot" of the USA.

Greek consciousness traditionally resulted in communities taking far more interest in Greek than in Canadian politics. Canadian Greeks returned to fight in the Balkan Wars of 1912–13, were divided between Venizelists and Royalists in and after World War I but joined forces in their opposition to the Germans in World War II, contributed generously to the Greek Relief Fund to aid the Nationalist Government against the communists in the Civil War, and later have been united in their opposition to the claims of Turkish Cyprus and the Former Yugoslavian Republic of Macedonia. In response to the junta in 1967–74 Andreas Papandreou, while a visiting professor at York University in Toronto, founded the Panhellenic Liberation Movement (PAK, later PASOK) before he returned to Greece as leader of the opposition and, in 1981, became its first socialist prime minister. In contrast the earliest serious interest in Canadian politics was not shown until the early 1960s when the Greek Association of the Liberal Party was founded in Montréal. By 1993 two senators, two members of the federal parliament, and one member of a provincial parliament (Saskatchewan) could claim a Greek origin.

Classical Greek (and Latin) language and literature and ancient history have traditionally been taught at Canadian universities in separate Classics departments, some of which in the 1990s became parts of larger departments of languages or Western civilization. Since the 1970s there has been a huge growth in courses on Greek (and Roman) culture, whose lack of a linguistic requirement has often resulted in enrolments of up to 300 students. A few universities have offered courses in Byzantine Studies and there is a Canadian committee affiliated to the Association Internationale des Études Byzantines. University courses in modern Greek have been rare and mainly in Montréal. Most Classics professors used to be both foreign born and trained (mainly in the UK and the USA), but, owing to a curb on immigration and a growth of graduate studies, most appointments made since the early 1980s have been of Canadians, though very few of these have been of Greek descent.

Publications by Canadian classicists were paltry until the 1950s, but since then there has been an upsurge of scholarly activity, much of very high quality. Since 1946 the Classical Association of Canada has published annually the internationally respected journal *Phoenix*, which has since been joined by *Classical News and Views / Echoes du monde classique* (1957, radically improved in 1982 as *Echos du monde classique / Classical Views* and issued with an annual fascicle of Canadian archaeological reports), *Teiresias: A Review and Continuing Bibliography of Boiotian Studies* (1971, now entirely electronic), *Cahiers des études anciennes* (1972), *Dionysius* (1977), and *The Ancient History Bulletin* (1987). In March 1989 the University of Western Ontario established the Centre for Olympic Studies (the first such centre in the world), which since 1992 has published annually its *International Journal of Olympic Studies* and biennially the *Proceedings* of its symposia. Byzantine studies have been remarkably fostered by the Hellenic Canadian Association of Constantinople which since 1992 has regularly published as monographs the public lectures that it sponsors.

Canals

Until well into the 20th century difficulties of overland transport in Greece have led to a preference for water routes. A lack of navigable rivers has meant that long portages could not always be avoided, but Greece's deeply indented, irregular coastline has also provided opportunities to shorten both land and water passages through the construction of canals.

The most obvious site for a canal is at the isthmus of Corinth, which is a mere 6 km wide. A canal at this point was an objective of rulers from the 7th century BC to the modern era. The Cypselid dynasty, which ruled Corinth from the mid-7th to the early 6th century BC, was credited by ancient sources with a number of major projects linked to water transport. The dynasty's founder Cypselus was said to have dug a canal which separated Leucas (a Corinthian colony) from the mainland, making it an island. His son, Periander, constructed the artificial harbour at Lechaeum, on the north side of the isthmus. Late sources claim that he intended to dig a canal, but had to settle for a slipway, called *diolkos* in Greek. Traces of this construction, consisting of a paved roadway and two channels, are still visible, and archaeological as well as literary evidence supports the conclusion that it was originally constructed in the late 7th or early 6th century BC. The original purpose of this slipway is not entirely clear. The *diolkos* is near to neither of Corinth's ports, and was probably used by ships who were simply in transit. All the explicit mentions of its use involve the transport of warships. Still, this is unlikely to have been the *diolkos*' principal function as envisaged by its Corinthian builders who, after all, controlled harbours on both sides of the isthmus. It has been suggested (Cook, 1979) that the objectives of the original builders were commercial. Use of the *diolkos* allowed the Corinthians to levy tolls on those who were not actually trading with them but were passing through Corinthian territory. This slipway remained usable at least into the period of the early Roman empire, and there is some

evidence that it was continuously in use up until the 9th century AD.

A canal at the isthmus of Corinth was supposedly contemplated by a variety of Hellenistic and Roman luminaries. The Roman historian Suetonius gives an account of Nero attempting to encourage the praetorian guard in this endeavour by breaking the ground and carrying the first basket of earth himself. This was not merely one of Nero's extravagant but empty gestures, since trenches 1.5 to 2 km long dating to his reign were visible before digging for the modern canal began. This canal was finally completed in 1893 during the administration of the prime minister Charilaos Trikoupis. It was one of many public works projects aimed at modernizing the country's infrastructure. For ships which can pass through the canal, the voyage from the Aegean to the Ionian Sea is shortened by some 325 km.

The second famous canal in Greece was the work of the country's enemies. The assistance that Athens and Eretria lent to the Ionian Revolt attracted the negative attention of Darius, king of Persia, who sent an expedition ostensibly to discipline those two cities. However, the expedition never progressed further than Macedonia because of excessive casualties on land and a disaster at sea. Attempting to sail round the Athos peninsula, the fleet was caught in a gale; Herodotus claimed that about 300 ships and over 20,000 men were lost as a result. A second attempt by Darius resulted in the great Athenian victory at Marathon. Herodotus presented Darius' successor Xerxes as eager to take revenge on the Greeks. He raised a force which dwarfed all the famous armies of the past and took extraordinary steps for the transport and provisioning of the expedition. In order to avoid a repeat of the Athos disaster he ordered that a canal be cut across the peninsula at its narrowest point, a distance of slightly more than 2 km. The project took three years to complete, and when finished the canal was the width of two triremes. Perhaps with the *diolkos* at Corinth in mind, Herodotus stated that Xerxes could easily have had the ships dragged across the narrow spit of land. He dismissed the canal as a work of ostentation, another manifestation of Xerxes' fatal hubris. Indeed, some ancient writers doubted that the canal had ever existed, or suggested that it had been only partially cut, with the ships being dragged the remainder of the distance. Nevertheless, European travellers of the 18th and 19th centuries noted traces of ditches and a chain of marshy lagoons along the line where the canal presumably ran. Recent geophysical investigations by the British School at Athens confirmed a V-shaped feature running along this line which agrees in its general dimensions with Herodotus' description (Isserlin *et al.*, 1994). The question of whether the cut completely severed the peninsula, turning it into an island, remains unsettled. The character of the soil along the southern portion of the presumed course of the canal would have made excavation much more difficult. Cores taken from the fill of the canal have no marine indicators, perhaps evidence that it had no direct outlet to the sea or that it was open only for a short time. Herodotus states that as part of the canal-building project breakwaters were constructed to keep the canal from silting up. No traces of these breakwaters have been found and, if they were in existence only for a short time, the canal itself may have had only a brief useful life (Isserlin *et al.*, 1996).

In post-Classical times Greek engineers had at their disposal more elaborate techniques for the building of artificial waterways. In the 3rd century BC Ptolemy II Philadelphus restored the Nile–Red Sea canal which had existed in the time of the pharaohs. Diodorus Siculus describes it as having a gate that could be opened and closed quickly, while Strabo mentions that boatmen could sail in and out easily. All of this suggests some kind of lock. Egyptian reliefs showing heavily laden ships voyaging between Egyptian Thebes and the land of Punt by way of the Red Sea attest to a much earlier canal which would also have been equipped with a lock (Moore, 1950, p. 99).

Roman military engineers assured the supply lines of the empire through a series of canals, dykes, and locks in the western European provinces. Pliny the Younger suggested to the emperor Trajan, while he was governor of Bithynia, that the construction of a canal between the city of Nicomedia and a lake in the interior might be a worthwhile project. The canal was never constructed, but in the 6th century AD Justinian proposed an even more ambitious scheme to connect the Black Sea with the Propontis. This was to involve reversing the current in the Sangarius river, which flows northeast into the Black Sea, so that it would instead flow southwest into the lake. From there, a canal would be used to convey ships to Nicomedia. However, the only evidence that construction was even begun is the existence of an absurdly large bridge over the Melas river. This insignificant stream was supposed to receive the flow of the diverted Sangarius, but the plan was never accomplished (Moore, 1950, p. 108–09).

Candia, Fall of 1669

Determined to achieve supremacy throughout the eastern Mediterranean, and anxious to secure full control of the sea routes, the Turks eventually found a pretext for organizing a campaign to expel the Venetians for good from Crete and the

Levant. In 1644, off the island of Rhodes, a naval force of the Hospitaller Knights of St John captured a Turkish ship that was carrying functionaries of the Ottoman state on pilgrimage to Mecca. Among the captives was one of the wives of the sultan and their son. On their way back to Malta the knights anchored off Kaloi Limenes in Crete and released the Christians who had been slaves of the Turks, and took on supplies. Although the Venetian authorities on Crete had done their best to send the knights on their way as quickly as possible, the Turks nevertheless accused the Venetians of harbouring hostile forces, and declared war.

In 1645 the Turkish fleet commanded by Yusuf Pasha anchored in the port of Suda and a large military force disembarked close to the monastery of the Virgin at Gonia. Meeting no resistance, the Turks marched towards Chania, destroying villages and monasteries on the way. The Venetians tried to muster some counteroffensive, but to no avail. On 22 August 1645, after coming to terms, the town surrendered to the Turks. The conquest of Chania does not seem to have alarmed the European powers, who failed to appreciate the expansionist designs of the Ottomans. After repeated appeals for help from Venice, a small fleet of galleys sent by the pope, Spain, Malta, and the duke of Tuscany eventually arrived in Crete, some days after the surrender of Chania. Attempts to recapture the city were in vain; it was lost for good. In just a short space of time the Turks managed to establish control over most of western Crete, particularly the areas of Kissamos, Kydonia, and Apokoronas, reaching the gates of Rethymnon.

The siege of Rethymnon began in the autumn of 1646. At the start of the siege the Venetians had ordered the transfer of the population of the city to Candia in order to escape the continual bombardment from the Ottoman artillery and the food shortages. In the summer of the same year the city was afflicted by the plague, aggravated by the insanitary and squalid conditions of the besieged. At last, on 13 November of the same year, the *fortezza* of Rethymnon surrendered to the Turks.

The siege of Candia began in 1648, and it was to drag on for no less than 21 years, a duration that has few parallels in world history. Francesco Morosini, the last defender of Candia, was appointed head of the Christian forces in this critical contest between Christendom and Islam. Alongside him there were the reinforcements sent by the Knights of Malta, the pope, Spain, France, Tuscany, and the duke of Savoy. Yet despite the spirited resistance of the Venetians, the Cretans, and their allies, Candia could not hold out indefinitely against the Turkish onslaught. Before the superior might of the Turkish military machine under the leadership of the grand vizier Ahmet Köprülü, and under no illusion that defeat was avoidable, Morosini eventually opted for a diplomatic solution: on 16 September 1669 after long negotiations attended, on the Ottoman side, by the Greek interpreter Panayotis Nikousios, and on the Venetian side by the Scotsman Annant and the Cretan noble Stephanos Skordilis, an agreement was signed whereby the island of Crete, with the exception only of Gramboussa, Suda, and Spinalonga, became Ottoman territory. Besides their arms and canons, the terms of the treaty allowed the Venetians to take with them their treasures and the government archive. It is for this reason that the valuable archive of the duke of Crete survived, brought back from Candia to Venice, where it is still preserved today. The transportation of the archive was supervised by the Greek Thomas Sakellaris.

The fall of Crete to the Ottomans was a severe blow to Venice, not only because it lost its most important dominion in the eastern Mediterranean, but chiefly because its prestige was irreparably dented. As they left the city, the Venetians dismantled the huge cross that they had erected in 1648 at the highest point of the city on the tower of Martinengo as a symbol of the city's strength. The immediate result of the Turkish conquest of Crete was a substantial reduction in the size of the population. Numerous Cretans, preferring flight to servitude, sought refuge in other Venetian dominions, and in particular in the Ionian islands or in Venice itself. This catastrophic war that shocked the Christian west, the plundering of the city's treasures, the destruction of the churches, and the expulsion of the population are described vividly for us in the long poem by the Rethymniot Marinos Tzanes Bounialis, *The Cretan War*.

Canon Law

The Byzantine Church never produced an exhaustive and juridically consistent corpus of canon law, but it did recognize the permanent authority of a body of conciliar decrees and patristic opinions issued at various times and in various circumstances. Byzantine theology avoided rationally structured systematization, so the Byzantine Church never bound itself with an exhaustive code of ecclesiastical laws. The councils issued canons related to the structure and administration of the Church and to discipline, but all these texts reflected the requirements of particular situations. The canonical requirements were seen as absolute, inasmuch as they reflected the permanent norms of Christian doctrine and ethics, but in many cases the Byzantine Church also recognized the possibility that these same norms could be preserved not by applying the letter of the law, but by exercising mercy or condescension. Moreover the harmonious coexistence of the empire and the Church, as it was defined mainly by the emperor Justinian I (527–65), made it inevitable that imperial decrees came to be authoritative for the Church as, reciprocally, the empire recognized that ecclesiastical canons had the force of law. The text that comes closest to a theoretical definition of church–state relations in Byzantium is *Novella* 6 of Justinian I, which defines the priesthood and the imperial dignity as "the two greatest gifts of God" to mankind, and insists on their common divine origin. The ideal, as presented in the *Novella*, is a harmony between the two powers. In many cases of conflict

between the two parallel systems the canon law prevailed. The result of this system was that many areas of Church discipline, such as the system for electing bishops and rule of marriage, were covered by imperial legislation, while in turn the emperors were formally bound by ecclesiastical canons (a famous case with many implications was the Church's opposition to the fourth marriage of emperor Leo VI).

Ecclesiastical canons and imperial laws regulated the election of patriarchs. Justinian (*Novella* 174, issued in 565) required that an electoral college of clergy and "important citizens" – similar to the college of cardinals in Rome – participate in the election, but the laity, with the exception of the emperor, were soon eliminated from the process. According to Constantine VII Porphyrogennetos (913–59), the metropolitans of the synod chose three candidates so that the emperors could pick one, while reserving for himself the option of making another choice as well. This openly admitted role of the emperor – which formally contradicted canonical proscriptions against the choice of clerics by civil rulers – was perhaps understandable in view of the political functions of the "ecumenical" patriarch in the state.

The sources of Byzantine canon law are the following:

Decrees of ecumenical councils. The decrees of Nicaea (325), Constantinople I (381), Ephesus (431), Chalcedon (451), the Quinisext Synod, also known as the Council in Trullo (692), which issued canons on behalf of Constantinople II (553) and Constantinople III (680–8), and Nicaea II (787).

Apostolic canons. These represent 85 disciplinary rules going back to the first half of the 4th century. Originating in Syria, they were given formal canonical authority by the Council in Trullo.

Canons of local councils. These were the canons of Ancyra (314), Neocaesarea (314–25), Antioch (341), Sardica (343), Gangra and Laodicea, and Constantinople (394). There were also the canons of Carthage (418), which included decrees of several councils of the north African episcopate held between the 3rd and the 5th centuries, as well as the later canons of Constantinople (859–80), sometimes referred to as the "Eighth Ecumenical Council".

Canons of the Fathers. These were a collection of patristic excerpts that were given formal canonical authority by the various councils. They included texts by Dionysius of Alexandria (died 265), Gregory of Neocaesarea (died 270), Peter of Alexandria (died 311), Athanasius of Alexandria (died 373), Basil of Caesarea (died 379), Gregory of Nazianzus (died 389/390), Amphilochius of Iconium (died 395), Timothy of Alexandria (died 355), Theophilus of Alexandria (died 412), Cyril of Alexandria (died 444), and Gennadius of Constantinople (died 471).

As for imperial legislation on ecclesiastical affairs, the most important compilation was the *Corpus Iuris Civilis* of Justinian I, followed by the *Novellae* (*Nearai* in Greek) issued by him and succeeding emperors. Other important sources of imperial legislation on ecclesiastical affairs are the *Ekloga* (731–41) and, particularly in the legislation of the Macedonians, the *Procheiros Nomos* (870–78), the *Basilics* (867–912), and the *Epanagoge.*

Nomokanon is a term used in Byzantine canon law to designate a collection presenting synoptically both ecclesiastical canons (*kanones*) and civil laws (*nomoi*) on ecclesiastical subjects. These were systematized collections of imperial laws and ecclesiastical rules arranged according to topic. The earliest was the *Nomokanon of 50 Titles*, assembled by an unknown compiler towards the end of the 6th century from two works by the lawyer-patriarch of Constantinople Ioannis III Scholastikos (565–77): the first one is the *Synagoge of 50 Titles*, a topical arrangement of conciliar canons to which Ioannis added the so-called apostolic canons, the African Code, and diverse excerpts from the letters of Basil the Great, and the second one a collection of civil laws in 87 chapters.

More influential was the *Nomokanon of 14 Titles*, assembled between 629 and 640 by the anonymous jurist usually known as Enantiophanes. Civil laws are drawn from a collection known as the *Tripartita*, while canons and the overall arrangement derive from the *Syntagma of 14 Titles*, which appeared in Constantinople in the later 6th century.

The *Nomokanon of 14 Titles* as well as the *Syntagma* went through several later compilations, these serving mainly to incorporate new canonical texts. Most famous is the compilation of the *Nomokanon* of 883, often ascribed to patriarch Photios, which not only enjoyed wide circulation in the Byzantine empire but also served as the basis for the major Slavic canonical collection known as *Kormchaya Kniga*, edited by St Sava of Serbia (13th century) and subsequently accepted in all the Slavic lands of the Balkans and Russia. Also noteworthy is the compilation of Theodore Bestes (in 1090), which gives an improved text for the imperial laws, and the extensive commentary of Theodore Balsamon (*c.*1170–78).

In late Byzantium the term *nomokanon* also came to be applied to manuals on penitential matters intended for the use of confessors. Such manuals circulated from the 9th century, often under the name of John the Faster (patriarch of Constantinople, 582–95). Their wide diffusion in the Slavic world, particularly in Russia, stems above all from the monastic communities of Mount Athos.

The authoritative commentaries on canonical legislation listed above appeared particularly in the 12th century. The commentary of Ioannis Zonaras attempted to classify canons according to their relative importance and authority. Alexis Aristenos emphasized their historical context. Theodore Balsamon, titular patriarch of Antioch during the reign of Manuel I Komnenos (1143–80), produced a major commentary on the entire *Nomokanon of 14 Titles* that attempted to coordinate the ecclesiastical legislation of the previous centuries and the civil legislation contained in the *Corpus Iuris Civilis* and the *Basilics.*

The permanent synod (*synodos endemousa*) at Constantinople regularly issued decrees on canonical and doctrinal issues. Since the archives of the patriarchate were almost totally destroyed by successive invaders (mainly after 1204), only a small part of the decrees have been preserved in their original text. In the last two centuries of the empire, as the power of the emperors diminished dramatically, the patriarchs assumed a wider role and greater competence in the affairs of society far beyond the shrinking borders of the empire. This new role was expressed in the concept of "universal leadership" (*kedemonia panton*) used in patriarchal decrees

of that period (1261–1453), but their influence and their role were not comparable with those of the popes.

The entire legislative body of canonical texts was, according to Byzantine tradition, entrusted to the stewardship (*oikonomia*) of the bishops, with local provincial synods as well as the permanent synod at Constantinople acting as courts of appeal or as supreme tribunals. In the New Testament this term is used to designate God's plan for the salvation of mankind (Ephesians 1: 9–10, 3: 2–3) and also the stewardship entrusted to the bishops (1 Corinthians 4: 1; Colossians 1: 24–25; Titus 1: 7). This biblical origin of the term helps to explain the Byzantine canonical notion of *oikonomia*, which was not simply an exception to established rules but "an imitation of God's love for man" (Nicholas Mystikos), and implied repentance by the pardoned sinner. The principle of *oikonomia* implied a certain discretion given to the bishops in applying sanctions against repentant sinners. Politically minded patriarchs tended to expand the concept of *oikonomia*, more especially when imperial and political interests were involved, whereas the monks stood for a stricter interpretation of Church rules. On several occasions controversies, and even schisms, occurred over the issue of the use of *oikonomia*, for example the "moechian" schism in the early 9th century, on the occasion of the adulterous marriage of emperor Constantine VI, the "Tetragamy" of Leo VI in the 10th century, and the religious and political movement of hesychasm in the 14th century. However, everyone agreed on the principle that one could practice *oikonomia* only, in the words of Eulogius of Alexandria, "whenever orthodox doctrine remained unharmed", though there were many problems and misunderstandings.

A very important aspect of the Byzantine Church and of Byzantine canon law is the acceptance, at least as a principle, of a multiplicity of ecclesiastical centres. During the Palaiologan dynasty (1258–1453) the empire barely survived under the steady advance of Ottoman power in Asia Minor and, later, in the Balkans. During the same period the patriarchate of Constantinople, adapting to the new political situation, succeeded not only in maintaining its jurisdiction over vast territories but also in acquiring greater prestige and authority. When the Latins occupied Constantinople (1204–61), the patriarch went to exile in Nicaea, but continued to be recognized as the head of the mother Church of the Orthodox Slavs. From his exile he was more flexible and more generous towards them than his predecessors who had resided in the imperial city at the height of its power. In 1219 he appointed St Sava as the first archbishop of an independent Serbian Church. Sixteen years later he recognized the Bulgarian patriarchate of Tornovo. The Russian Church, destined to become the most powerful heir of Byzantine civilization, remained firmly under the patriarch's ecclesiastical control for the centuries to come. It was during the era of the grand prince Ivan III (1462–1505) that the Russians began to see in their powerful capital of Moscow a "new Constantinople" or a "third Rome". Nevertheless, it was still from Ottoman-held Constantinople that the Muscovite princes sought and obtained the recognition of their imperial title and, in 1589, the establishment of a patriarchate in Moscow.

That was the starting point for the development of autonomous ecclesiastical centres under the spiritual control of Constantinople. These ecclesiastical centres developed their own practices and their own canonic texts. The Church of Constantinople produced canon laws within its jurisdiction (more or less the territories of the Ottoman empire) and the patriarchate of Moscow for the territories of Russia. This trend created different sources of canon law for each autonomous Church in the Orthodox communion and currently the most accurate approach to the canon law of the Eastern Orthodox Church should be comparative. Of course the differences between the canon law systems of each "autocephalous" church are not essential, and in any case they carry the legacy of Christian Byzantium.

The Church of Greece, founded in 1833 and recognized by Constantinople in 1850, now has its own sources of canon law in addition to the ones that it has inherited. Most of these sources are the laws of the Greek state, which regulate every administrative and legal aspect of the Church. The general legal framework describing the relations between Church and state is provided by article 3 of the Greek Constitution:

> The prevailing religion in Greece is that of the Eastern Orthodox Church of Christ. The Orthodox Church of Greece, acknowledging our Lord Jesus Christ as its head, is inseparably united in doctrine with the Great Church of Christ in Constantinople and with every other Church of Christ of the same doctrine, observing unwaveringly, as they do, the holy apostolic and synodal canons and sacred traditions. It is autocephalous and is administrated by the Holy Synod of serving Bishops and the Permanent Holy Synod originating thereof and assembled as specified by the statutory Charter of the Church in compliance with the provisions of the Patriarchal Tome of 29 June 1850 and the Synodal Act of 4 September 1928. The ecclesiastical regime existing in certain districts of the state shall not be deemed contrary to the provisions of the preceding paragraph.

Canonization

The concept of an abiding office and role of intercession for certain leading disciples of Christ who have followed their Lord into heavenly glory is one that is witnessed even in the primitive Church. The apostles were promised thrones of glory in the Kingdom (Matthew 19: 28), a promise that was always understood to signify a continuing role of powerful influence, even the exercise of judgement, within the context of the eschatological dominion of Christ. The early Church, from earliest times, therefore, understood that certain elect disciples would exercise an office of intercession with Christ that began in this life but would endure into the next. While Paul called all the members of the Christian assembly "the saints" it is clear enough that the Christian populace soon regarded certain "saints" as more significant than others. The central issue seems to have been the extent of their intercessory power. The first example of this attitude, observable in the New Testament writings themselves, was the cult of the apostles. Among the latter, Peter and Paul were given special pre-eminence.

In the persecutions of the 3rd and 4th centuries the extending cult of martyrs developed the idea of "saints" even further. The Christians regarded those who had died for the sake of their faith as surely guaranteed the reward of eternal life with Christ. Already in the Book of Revelation the martyrs are described as clothed in glorious white garments and praying before God's throne (Revelation 6: 9f.), pointing yet again to the centrality of the issue of intercession involved in the Christian cult of the saints. Those who proved themselves constant in time of persecution, but were spared the ultimate penalty of death, came to enjoy great status in the Church. The letters of Cyprian of Carthage in the 3rd century demonstrate the conflict that could arise between these "confessors" and the episcopate. The faithful clearly regarded the confessors as sharing in the prerogatives of the martyrs, and able to exercise on earth an intercessory power with Christ on behalf of sinners. This belief paved the way for the fully developed cult of saints which expanded from martyrs alone to embrace a wider range of favoured disciples, such as ascetics and hierarchs; all of whom were "included in" the concept of martyrdom (even if only symbolically) by themselves being called confessors, a title that became commonly used of later non-martyr saints.

Archaeological evidence shows that the early Christians often desired to be buried alongside their martyrs, hoping that on the day of resurrection they would be in the presence of elect souls who would intercede for them. Soon, especially from the 4th century onwards, the bodies of martyrs were transferred from common cemeteries and enshrined in special churches. Their entombed bodies became focuses of pilgrimage. They were petitioned for intercession with God, especially for healing miracles, and for the grace of forgiveness.

The beginning of the rationalization of the cultus of saints can be traced to the late 2nd century, but it is really visible in the 4th and 5th centuries. By this era the monastic ascetics came to be regarded as a new paradigm of what would constitute an ideal disciple. Athanasius' *Life of Antony* enjoyed an immense popularity and can almost be regarded as the progenitor of the genre of Christian hagiography. In this case the great popular esteem with which Antony was regarded as a Christian ascetic and holy man was reshaped by Athanasius, an important Alexandrian hierarch, and brought to serve other ecclesial ends – not least the furtherance of doctrinal orthodoxy. In the next generation the Cappadocian Fathers (especially Gregory of Nazianzus and Gregory of Nyssa) developed the genre of hagiography in texts that were designed to highlight the sanctity of their own familial circle, and offer them as ideal figures of Christian discipleship. The Cappadocians developed Christian hagiography from the basis of Hellenistic panegyric and, like Athanasius, their motive of shaping a form of orthodox doctrine was never far from mind as they tried to group a wider circle of the faithful around the ideal image of a saint whom they idealized in their encomium (the *Life* of the Saint) as a model of virtue and orthodoxy. Gregory of Nyssa's *Life of Macrina* and Gregory of Nazianzus' *Funeral Sermons* on members of his family are early examples of this hagiographical process. Panegyric texts such as these soon came to have a special liturgical significance.

In the final stage of development, after the 5th century, all the elements of the picture come together. Now, in addition to a hagiographic text and the actual possession of a body (the relics of the saint), the practical benefit of results is more insistently required. No longer is it enough to expect heavenly intercession from the saint: some earthly manifestation of benefit is also needed. The element of manifestation (*epiphaneia*) is most commonly spoken about with regard to miracles of healing. Frequently the older element of reconciliation, which the saint can effect with God, is presumed and much of the healing genre (especially the healing of demoniacs) can rightly be classed as a variant form of speaking about reconciliation and release from guilt, a theme that was paramount in the earliest cult of martyrs.

The 5th century witnessed a number of *inventiones*: the discovery by miraculous dream-intimations of lost relics of great saints from earlier times. The empresses Pulcheria and Eudoxia gained great status by their *inventio* of relics, and the clearest example of how this cult of saints' intercession was related to the exercise of power in Byzantium can be seen in the legends of Constantine's mother Helena. The story of her finding of the True Cross, the supreme relic in Byzantine estimation, is a classic of the type. So too is the story, preserved in the writings of Cyril of Alexandria, of the discovery of the relics of Cyrus and John, the Holy Unmercenaries (healer saints), which Cyril translated to Menouthis in the early 5th century to offset the continuing attraction of the Isis cult in Egypt. The process of recognizing the places where the saints lay hidden, or recognizing more generally that this person was a powerful intercessor with God (*anagnorisis*) had by the 5th

century become a statement not only about the great power of the saint, but also about the spiritual acumen of those who oversaw the celebrations at the saint's shrine. All the elements for what we might therefore call a canonization (*anakeryxis*) were in place, but the acclamation that attended the proclamation of a saint was still largely a local and popular matter (however orchestrated it might sometimes be by hierarchs or princes) in Byzantium until well into the 13th century. The crucial elements can thus be established as: (*a*) a paradigmatic life (ideally a martyrdom; secondarily a radically ascetic lifestyle); (*b*) the possession in the local church of relics that were regarded as focal points for the saint's activity – especially on his or her feast day, or the day or anniversary of the "translation" of relics (when they had been moved into a position of honour within the church); (*c*) a hagiographic narrative that could be read out on the feast day recounting the merits of the saint and invoking his or her presence; and finally (*d*) an icon of the saint (the last element increasingly coming into place as the centuries developed).

From the 6th century onwards, and throughout all later Byzantine literature, the genre of the "Life of the Saint" came to rival even biblical and theological commentary. The Cypriot hermit saint Neophytos shows a classic example of this plastic process of "canonization" as it developed with all the necessary elements being carefully supplied in advance. Some later Byzantine hagiographies show the difficulty in trying to fit examples of married women (who did not fit the paradigm of ascetics) into the rigid categories of sainthood that had become established in the hagiographic genre. The attempt of Symeon the New Theologian in the 11th century to canonize his own spiritual father, Symeon Eulabes, earned him the censure of the Synod of Constantinople, and although other matters of conflict were at work in this case, it also serves as a clear sign that the process of canonization was being regularized from the time of Basil II onwards.

By the 13th century an official ecclesiastical process was beginning to be established to regularize the process of declaring saints. It is only from this period that we can properly speak of a Byzantine "canonization" process. It followed a similar movement in the West, visible from the late 10th century when the papal court attempted to restrict the right to declare new saints to itself. In Byzantium the first example of "official" canonization seems to have been that of patriarch Arsenios in the late 13th century, and more cases are witnessed in the 14th century, including those of patriarch Athanasios I and Gregory Palamas. A certain focus on leading hierarchs and teachers is noticeable. In the formalization of the process the same criteria – of exemplary life, actively powerful relics, and a hagiographic and iconic tradition – remain as standards, all of which, of course, could themselves be summed up as evidence of a lively popular cultus of the individual in question. Where the cultus was not popular or extensive (some pertinent examples are given in the collection of "Lives" of women saints recently translated by A.M. Talbot), the individual in question never seems to have entered the Byzantine Church's Synaxarion, the liturgical canon of saints invoked in the offices of prayer, and entered into the festal calendar.

In present Orthodox practice the right to declare saints falls to the Holy Synod, the supreme juridical legislature of the various autocephalous Churches, but it is still in a large measure dependent on the ancient criteria – the prior existence of a lively cult of the saint (and thus the Christian acclamation (*anakeryxis*) that is at the heart of canonization resides, ultimately, in the spiritual sense of the Church at large), an expression of its faith in the closeness of Christ's leading disciples to their glorified master, and a sense that they enjoy special intercessory power with Christ, a power that they are still interested in exercising for the benefit of the "family" of Christians.

Cappadocia

Region of central Anatolia

Cappadocia's southern border is the Taurus range of mountains. The Black Sea lies to the north, and its eastern boundary is set by Armenia and the Euphrates, with Lake Tata at its southern end. It consists of rugged plateau country, originally known for the breeding of horses, with limited agriculture, good grazing, and a fair degree of afforestation on the higher ground. The region is divided into a northern part, known as "Cappadocian Pontus", or more often simply "Pontus", and a southern part known as "Greater Cappadocia", or simply "Cappadocia".

Early in its history the region was invaded by Assyrians and Hittites (2nd millennium BC), followed by Phrygians and Cimmerians (*c.*1000 BC). The Persians, who came next (6th century BC), left their influence in art and religion. Although not directly conquered by Alexander the Great, Cappadocia came under Macedonian control from the 4th century, as the native monarchy assimilated Hellenized patterns. This process was well advanced in the 2nd century BC, when kingdoms such as Cappadocia were forced to take sides for or against the Romans. A spell of vacillation ended in support for Rome. As a client kingdom Cappadocia gained a measure of protection, benefiting particularly from Pompey's restoration of order in the east. Annexation followed in AD 17, when Cappadocia was for a time combined with Galatia. Between 107 and 113, it was joined with Pontus to form a new province, an arrangement which lasted until the reign of Diocletian (284–305). The strategic importance of this frontier province was recognized by the building of roads and the stationing of garrisons. The

area became one of large estates, including imperial ones, clearly worth defending. It contrived to resist complete absorption into Roman life, maintaining an identity which included a form of the Cappadocian language which survived into the 3rd century AD.

Immigration was also an important factor in the history of Cappadocia, whether of Jews and Celts in the Hellenistic period or of Armenians in the 6th century AD. The diaspora Jews of Cappadocia were a significant element in the history of the Christian Church, mentioned in Acts 2: 9 as present at Pentecost and again referred to in 1 Peter 1: 1 as a notable part of the Jewish community, amenable to conversion. Christianity was established early in Cappadocia and the region came to play a notable part in its development. Mazaka became the capital in the 2nd century BC, but was renamed Caesarea (modern Kayseri) in 12–9 BC and became the provincial capital in AD 17, serving not only as an administrative centre but as a focus of literature and learning. This cultural primacy was encouraged by the emergence of a notable bishopric. St Firmilian (d. 268) was an impressive occupant of the see who was on intimate terms with Origen and was able to invite the Alexandrian teacher to Caesarea. Cappadocia did not escape persecution, whether under Emperor Maximinus "the Thracian" (235–38) or Decius, in the years 249–51. Throughout all this, Cappadocia maintained a reputation for Christian orthodoxy, in contrast to the sundry heterodox movements that developed in neighbouring Phrygia.

It was, however, in the 4th century, following Constantine I's acceptance of Christianity, that Cappadocia achieved its most noteworthy Christian status, through the birth there and lifelong work of the so-called Cappadocian Fathers, Basil of Caesarea, Gregory of Nazianzus, and Gregory of Nyssa. Associated with them were Macrina, the sister of Basil and Gregory of Nyssa, Amphilochius of Iconium, and Asterius of Nemesa. Cappodocia was also the birthplace of the emperor Julian, who came to be known as "the Apostate", for although brought up as a Christian he repudiated the faith and attempted to restore paganism, to the great anger of Basil and Gregory of Nazianzus who had been fellow-students in his Christian days. The preservation of the Nicene faith and its definitive expression at the Council of Constantinople in 381 owes much to the relentless exertions of the Cappadocian Fathers.

Alongside these searches for orthodox theological expression are the works of art of the Cappadocian Church. The region's rock-cut churches are decorated with complex wall-paintings that are variously primitive, bold, and direct in character and show a continuity of style, perhaps reflecting long traditions of monastic life and geographical remoteness. This isolation may well have been of importance during the iconoclastic controversy of the 8th and 9th centuries, allowing the secret preservation of works which might otherwise have been destroyed. The paintings were seen as valuable aids to meditation, with the potential to arouse strong emotions and to have an influence beyond their native region. Their distinctive character is thought to have affected painting styles in Thessalonica and possibly Italy. The 12th-century paintings of Elmale Kilisse, Qaranleq Kilisse, and Tchareqle Kilisse are particularly noteworthy.

Cappadocia maintained some measure of Greek identity until the Treaty of Lausanne in 1923, when the Greek population of Cappadocia, along with the communities of Pontus and Lycia, were repatriated under an exchange scheme agreed with the Turkish government.

Summary

Region of central Anatolia, Hellenized from the 4th century BC in the wake of Alexander's conquests. There were significant Jewish, Celtic, and Armenian minorities, but Cappadocia was known for its Christian orthodoxy. Most notable were the so-called Cappadocian Fathers of the 4th century, Basil of Caesarea, Gregory of Nazianzus, and Gregory of Nyssa. Also distinctive are its rock-cut churches.

Carneades 214/13–129/28 BC

Philosopher

A pupil of Hegesinus the Academic, Carneades became the classic exponent of the sceptical interpretation of Plato. According to this, the essence of Plato's thought was to be found, not in the positive teachings of the later dialogues, but in the diffidence of Socrates, who maintained that he knew nothing, pronounced most of his arguments inconclusive, and was willing in the *Phaedrus* to deliver successive speeches on the same question in opposing characters. Carneades, however, also made himself familiar with a more dogmatic system under

the Stoic teacher Diogenes of Babylon, and many of his discussions (which were not committed to writing but reported by his pupils) take the form of animadversions on Chrysippus, the most accomplished dialectician of that school. Indeed, he is reputed to have said that he would have been nothing without Chrysippus (Diogenes Laertius, *Lives of Philosophers*, 4. 62). Chrysippus averred that the wise man has no opinions, since he is able to distinguish between impressions that are dubitable or false and those that are truly cognitive. Carneades, on the other hand, believed that by exposing the flaws in the arguments of his great Stoic predecessor he had proved the fallibility of all reasoning, and had thus shown that the wise man is bound either to have opinions or to think of nothing at all.

The most famous of his polemics were directed against the Stoic belief in providence. Chrysippus had urged that since the gods are wise they are bound to love us, and, since they know the future, cannot fail to speak in times of need through oracles and omens. Carneades turned this reasoning on its head by saying that, if it is true that a deity who is wise is bound to love us, the presence in the world of many evils that belie this love compels the impartial thinker to doubt either the existence or the wisdom of the gods (Cicero, *Nature of the Gods*, 3. 32). He was a strong proponent of free will, and is said to have attempted a tripartite classification of the possible goals of life. Against the Stoics who followed Chrysippus in upholding divination, he retorted that the evidence of the senses, unreliable though it is, is still more worthy of trust than the private arts by which the seers profess to detect an occult significance in nature (Cicero, *On Divination*, 2. 9). From the frequency with which his name is cited in polemics against astrology, it is probable that he is the source of many specific arguments espoused by the later, Pyrrhonist branch of scepticism; nevertheless his views can be distinguished from those of the Pyrrhonists in two respects at least. First, he did not acknowledge that his doctrine of universal fallibility was itself a thesis open to refutation; secondly, he did not assert that all fallible opinions were of equal weight, but held that we may have reasons for considering one more probable than another. The Carneadean sceptic therefore lives according to his own conclusions and not, as the Pyrrhonist has to do, according to the custom of his neighbours. Nevertheless the criteria that determined probability for Carneades are far from clear, and even his disciples found it hard in many cases to ascertain his own belief.

The most notorious episode of his life was his visit to Rome in 155 BC, when he joined the Peripatetic Critolaus and the Stoic Diogenes in a petition for the waiving of a fine that the Senate had imposed on Athens. To demonstrate his prowess in philosophy he spoke on one day before the Senate in support of a certain thesis and on the next with equal cogency against it. So impressive was this exhibition that the Senate at once acceded to Cato's motion for the settlement of the fine and the expulsion of the philosophers from the capital (Plutrach, *Cato Maior*, 22). Nevertheless, there is something not entirely foreign to the Roman spirit in scepticism. Cato himself is said to have thought that augury was a sham, and Cicero borrowed liberally from Carneades in his works *On Divination* and *On Fate* which offer persuasive criticism of the Stoics. The third and ablest speaker in his dialogue *On the Nature of the Gods* declares that the Stoics have not convinced him, and that therefore he rests content with ancestral custom, the *mos maiorum*. This is the acquiescence of a Pyrrhonist, yet Cicero himself, in more Carneadean fashion, admits the force of the arguments on both sides, but opines without giving reasons that the Stoic enjoyed the best of the exchange. Carneades was for him the paradigmatic figure of the New Academy, of which he professed at times to be a member.

Under the Roman empire, systematic thought was once again in fashion among the Platonists, and Numenius of Apamea, a 2nd-century AD precursor of Plotinus, accused the New Academy of a progressive apostasy from the genuine teachings of the master. Around AD 200 the Christian writer Clement of Alexandria appealed to sceptical arguments to demonstrate the bankruptcy of philosophy, and deduced that no constructive thought was possible for those who were unwilling to put their faith in an infallible revelation (*Stromateis*, 5). The objections to astrology that were borrowed from Carneades by the Pyrrhonist Sextus Empiricus were borrowed in turn from Sextus by Hippolytus of Rome (died 235) and by Augustine. Nevertheless Augustine's work *Against the Academics* upholds dogmatic Platonism against the Carneadean method which assumes that it is possible to discover what is "like the truth" (*veri simile*) without the knowledge of anything that is certifiably true. The Christian tradition had good reason to treat the sceptic as its natural adversary, in the west as in the east: a Pyrrhonian suspension of belief could be the preface to orthodoxy, as in Descartes, but where the Carneadean spirit prevailed, as in Voltaire and Bayle, it allowed at most a lukewarm and conventional adherence to the Church.

Biography

Born in Cyrene in 214/13 BC, Carneades was a pupil of Hegesinus at the Academy and also of the Stoic Diogenes of Babylon. He became head of the Academy (or founder of the New Academy) before 155 BC. In that year he joined Diogenes and Critolaus on an embassy to Rome. He left no writings but his ideas were recorded by his pupil Clitomachus. He resigned in 137/36 and died in 129/28 BC.

Carthage

Phoenician city in north Africa

The traditional date for the founding of Carthage is 814 BC. In the *Aeneid* Virgil immortalized the foundation myth of Queen Dido fleeing the Phoenician city of Tyre, and the murderous

designs of her brother, to the shores of north Africa where she established her 'New City' (*Kart-Hadasht*).

Carthage became a prosperous city governed by an oligarchy with two chief magistrates (*suffetes*) elected annually, and supported by a Council of 300 and a popular assembly advising them. This constitution was admired by Aristotle in his *Politics* (2. 8). It evolved later into the Court of the 104 Judges, and the Boards of Five. The ruling class used this system to block any ambitious *suffet* from becoming too powerful with the help of the army.

Soon the Phoenician seafarers of Carthage began to colonize Andalusia, Malta, Sardinia, and parts of Sicily. Phoenician tombs in these regions, dated between 800 and 700 BC, attest to this activity. The following centuries saw the further expansion of Carthaginian territory along the north African coast. One group among the leaders of Carthage favoured branching out into the interior where they occupied land in the Bagradas valley, and successfully practised agriculture among the Berbers. The majority of the leading men in Carthage, however, concentrated their activity on seafaring and trade. Carthage became the foremost among the Phoenician settlements along the coast of Africa, drawing revenues from their ports, which made it the wealthiest city in the western Mediterranean.

Eventually, Carthage's colonizing zeal and mercantile activities brought it into conflict with the peoples of the northern shores of the Mediterranean: first the Etruscans and Greeks, and later the Romans. In 535 BC Carthage in alliance with the Etruscans fought a victorious battle against Phocaeans at Alalia in Corsica and in 509 BC, as an established power in the western Mediterranean, it signed a treaty with Rome.

A Carthaginian army under the leadership of Hamilcar, possibly encouraged by Persia which was involved in conflict with the Greeks in the east, attacked Sicily in 480 BC. The invasion failed due mainly to an alliance between Syracuse and Acragas. Gelon (*c.*540–478 BC), the tyrant first of Gela and later of Syracuse, was a military leader of talent who had established his authority over more than half of Sicilian territory. In league with Theron of Acragas (488–472 BC) and others, Gelon defeated the Carthaginians in 480 at Himera. Rich spoils in booty and prisoners were taken, and Gelon, mindful of Apollo, dedicated a golden tripod to the god at Delphi. Carthage was forced to buy peace, paying a large war indemnity.

The Greeks of Sicily were threatened again by Carthage when a Punic force captured Selinus and Himera in 409. In 405 Dionysius I (*c.*430–367 BC), the tyrant of Syracuse, acknowledged Carthaginian possessions in western Sicily where Himilco founded Lilybaeum, but was later able to drive them out of Sicily, leaving them by 392 in possession of the island's western extremity only. It was under his weaker son Dionysius II that Sicily was once again thrown into conflict.

In 348, 306, and again in 278 BC Carthage concluded further treaties with Rome. The last of these treaties had as its raison d'être in the danger posed to Carthage and Rome by the coming of Pyrrhus to Sicily. Regardless of this, the two states were later drawn into armed conflict, having both become entangled in Sicilian politics.

The First Punic War broke out in 264 and lasted until 241 BC. It was essentially a war triggered off by conflict of interest between Carthage and Rome; the former attempting to gain control over the Greek cities of Magna Graecia, and the latter seeing it as an interference in its sphere of influence. To recoup Carthage's losses resulting from the war, Hamilcar Barca abandoned all interest in Greek Sicily and established a Carthaginian empire in Spain. The capture of Saguntum by Hannibal in 219 BC provided the casus belli for the Second Punic War which saw Hannibal's spectacular crossing of the Alps into Italy and a string of impressive victories, but ended with Hannibal's defeat at the battle of Zama in Africa in 202 BC. In his statesmanship Hannibal belongs to the Hellenistic world of the Mediterranean, and in his generalship to the tradition of Alexander the Great and Pyrrhus, the Molossian king of Epirus (319–272 BC). After Zama Hannibal fled to the court of King Prusias I of Bithynia where he committed suicide in 183/82 BC. The Third Punic War was provoked by Rome's African ally Massinissa, and led to the destruction of Carthage by Scipio in 146 BC.

The territory of Carthage was pronounced cursed ground, and when Caius Gracchus tried to establish a Roman colony there, his enemies in the Roman Senate resisted, and he failed. It was later colonized by Caesar and Augustus, becoming the capital of proconsular Africa in the 2nd century AD. As such it was a flourishing Roman city, equally famous as a centre of education for orators and lawyers. Tertullian and Cyprian made it an important Christian city in the 3rd century AD; and in later years the bishop of Carthage was to play a significant role in Latin Christianity.

In AD 439 the Vandal king Gaiseric seized Carthage and made it the capital of his kingdom which lasted until AD 533/4, when Africa was conquered by Belisarius, the general of the emperor Justinian. Carthage remained the centre of the reconquered territory, and in time became the seat of the exarchate of Carthage. The exarchate was an administrative structure of the early Byzantine empire in which the exarch, appointed by the emperor in Constantinople as a kind of viceroy, wielded absolute power as chief administrator and military commander.

Justinian reconstituted Byzantine rule over Africa by appointing initially a *praefectus praetorio Africae*. He was not at first given military powers, and the emperor ordered Belisarius to take measures for the safety of the territory. The *praefectus praetorio* was directed to reside in Carthage, and was given a large, salaried staff to be divided between civilian and military departments. The administrative organization of the territory reflected the fact that Italy, to whose jurisdiction Africa had formerly belonged, was still in the hands of the Goths. When Belisarius left for Constantinople, one of his officers, Solomon, remained in Africa as the first *magister militum per Africam*. Soon afterwards, however, he was also appointed praetorian prefect in addition to his military command. The *Novels* of Justinian, issued in AD 535, regulating the question of land ownership and the re-establishment of the Church of Africa, are addressed to Solomon, *praefectus praetorio Africae*. Some historians see in this the possible beginnings of the exarchates which were to provide the model for the later thematic organization of the empire. Evidence points in this direction, since in the late 6th century the exarch of Africa is addressed as such in the correspondence of pope Gregory the Great.

The city maintained close ties with the Byzantine empire. It was from Carthage that Herakleios, the son of the exarch of the same name, came in AD 610 to overthrow the emperor Phokas whose tyrannical government had brought the eastern empire to near ruin. In the darkest days of his rule Herakleios is said to have contemplated moving the seat of government to Carthage, and as late as AD 663 Constans II (AD 641–68) attempted to govern the empire from Syracuse.

Carthage remained loyal to Byzantium into the final years of the 7th century, resisting the advances of Islamic armies on their westward drive, but was finally taken in AD 698 by an Arab force, bringing to an end Byzantine rule in north Africa.

Summary

A Phoenician foundation near modern Tunis, Carthage became through trade the wealthiest city in the western Mediterranean. After early conflict with Greeks in Corsica and Sicily, Carthage fought a series of major wars against Rome, ending in the destruction of the city in 146 BC. Flourishing again by the 2nd century AD, Carthage fell to the Vandals in 439 but was reconquered by Byzantium in 533/34. Byzantine rule was ended by the Arabs in 698.

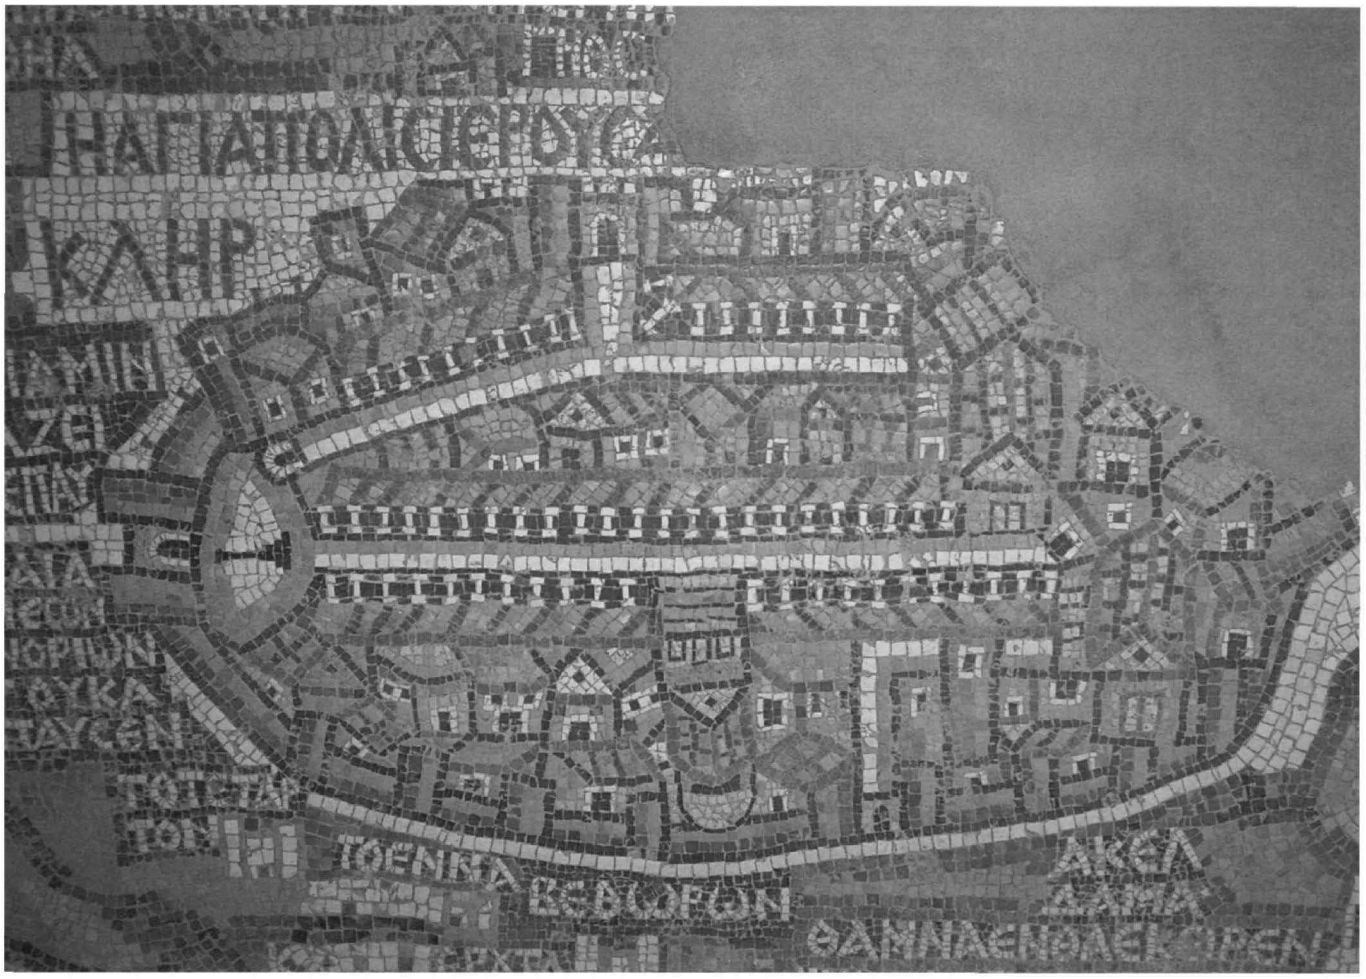
Cartography

In any consideration of cartography as practised by the Greeks, it quickly becomes apparent that there are two main divisions: the first is related to cosmology and theories about the origin and shape of the earth as a whole, while the second is rather more mundane and involves plans of a building, an area, a town, or a district, and may describe how to get from point A to point B, either by land or by sea. The ancients described these divisions as geography and chorography, respectively (cf. Ptolemy, *Geography*, 1. 1–5).

With regard to geography, early representations of the world survive from the Near East, the most famous perhaps being a clay tablet in the British Museum depicting Babylon and other districts and cities, along with the river Euphrates, all surrounded by a circular salt ocean with indications of mythical beasts and regions beyond the ocean. This object, dated *c.*600 BC, is surprisingly similar to the concept of the world promulgated by Thales of Miletus at about the same time, where the world is likened to an inverted bowl floating upon water: certainly the idea of the "River of Ocean" surrounding the land mass of the known world is remarkably persistent from Homer to late-Classical antiquity. As geographical knowledge improved, various writers recorded what they believed to be the spatial relationships of territories and peoples to each other, and it is from this information that many modern historical atlases present items such as "the world according to Hecataeus" or "Herodotus" or "Eratosthenes": actual ancient versions of these maps do not survive (indeed, modern versions seem to originate in the 1883 volumes of Bunbury), although there do exist Byzantine versions of Ptolemy's maps.

Circular maps were remarkably persistent, being found as late as the 1st century BC, even though Herodotus (4. 36) had mocked them in the 5th century. Of course, it is easy to confuse a circle with the representation of a sphere on a flat surface: the notion that the earth is spherical may have originated with Pythagoras and his followers in the late 6th century and certainly the idea was widely known by the 4th century, as can be seen from the production of "celestial spheres" (it is these, frequently with a zodiacal band, which appear in later statues of Atlas carrying a globe), all of which involved understanding of the equator, the tropics, and the polar zones, along with theories about inhabitable areas and the existence of "antipodes". Inevitably, people wanted to know exactly *where* they lived on this sphere and how *large* it was.

The gnomon (a vertical pointer, part of any sundial and possibly introduced from Babylon in the 6th century BC) made it possible to calculate latitude, if one knew the date and took one's readings at midday. Pytheas of Massalia (*fl. c.*320 BC) calculated the latitude of his home town to within about 13 km of the correct position; and from his famous voyage to the Tin Islands, around Britain, and possibly into the Baltic, he provided information about the length of solstitial days at various sites, which were later translated into degrees of latitude. (Longitude, of course, could not be calculated with any precision at all in antiquity, not that that prevented people from trying.) Eratosthenes of Cyrene (*c.*276–*c.*194 BC), chief librarian in Alexandria, was able, using a gnomon, to calculate that the distance from Alexandria to Syene (Aswan) was one fiftieth of the circumference of the earth, giving a result of 250,000 stades, which he later altered to 252,000 stades. There are several errors in Eratosthenes' calculations, notably that Syene lies on the Tropic of Cancer and that it is on the same meridian as Alexandria; however, these happen to cancel each other out and, depending on the length one accepts for a stade, his answer is either astonishingly close to the correct



Cartography: mosaic map of Jerusalem, mid-6th century, from a church in Madaba, Jordan

figure, or it is merely the best approximation arrived at in antiquity.

In a major work on geography Eratosthenes then proceeded to calculate the size of the *oikoumene*, the inhabited portion of the world, as known in the 3rd century BC, and to produce a detailed map of it, using lines of latitude and a number of meridians to produce a grid, within which countries were placed, each having a generalized indication of its overall shape. Our knowledge of this map comes from later sources and, although it was somewhat crude and modern reconstructions of it may be rather misleading, nonetheless it formed the basis of all subsequent attempts in antiquity to produce maps of the inhabited world as they would be understood today.

By the middle of the 2nd century BC terrestrial globes were being produced, though large segments of them were inevitably hypothetical. Map makers tended, therefore, to focus on maps of the "known" world and they were, by this time, concerned with two problems: the representation of a section of a sphere on a flat surface and the type of scale to use. Crates of Mallus (who visited Rome *c.*168 BC) created a very large map which was 7 feet wide from east to west and intended to represent a scale of 1 foot to 10,000 stades; apparently the meridians did not converge. This map and others like it were clearly unsatisfactory; so the problem of establishing a suitable projection was tackled by Ptolemy (Claudius Ptolmaeus, *c.*AD 90–168), who worked in Alexandria: he produced two projections, described in Book 1 of his *Geography*, and they constitute perhaps the greatest legacy from antiquity in scientific map making. In addition, the remaining seven books of the *Geography* catalogue by latitude and longitude about 8000 cities, mountains, islands, and the like, providing the raw material for the construction of a series of maps.

As for chorography, topographical representations have been identified in prehistoric carvings, and on rock and wall paintings and pottery, including an apparent "town plan" from Çatal Hüyük in Anatolia (*c.*6200 BC); and in Mesopotamia a seated statue of Gudea, ruler of Lagash in the mid-22nd century BC, shows on his lap a tablet bearing the plan of a large building with a scale along the top. In Egypt trigonometry and surveying instruments were developed in the early part of the Old Kingdom (*c.*2600 BC) to enable land allotments to be redefined after the annual inundation of the Nile; and many plans of estates, mines, and tombs survive from the period before 1000 BC. The Egyptian tradition of surveying and chorography became important for the rest of the Mediterranean world after the death of Alexander the Great, with the Ptolemaic dynasty and the scientific upsurge created by the Museum and Library in Alexandria. Alexander's expedition across the Middle East as far as India created huge logistical problems involving supplies and reinforcements, and Alexander, pupil as

he was of Aristotle and curious about everything, had surveyors ("bematists") and geographers in his train. The result was an expansion of earlier Persian "route maps" and other representations of the world (cf. the story of Cleomenes I of Sparta and his discovery, from a map, that to travel the Royal Road from Sardis to Susa involved a march of three months: Herodotus, 5. 49–50), while Ptolemaic surveys in Egypt both of agricultural land and of distances undoubtedly influenced developments in Carthage and in Italy, where the Greek cities of the south and then the Romans evolved elaborate systems of land surveying and allocation (centuriation). The building of highways throughout the growing empire produced what today are known as "strip maps", culminating in the ancestor of the famous Tabula Peutingeriana and in various Itineraries, which reflect major routes for land travel in the Roman empire and later.

Although these developments involved Greek-speaking lands, traditionally the Greeks were seafarers and their interests are reflected in *periploi* ("sea routes around"), which correspond to modern "Pilots", with descriptions of sea distances, landfalls, coastlines, river estuaries, and harbours. The earliest *periplous* which can be hypothesized is "Homeric": any modern analysis of the wanderings of Odysseus is controversial, but it may not be entirely fanciful to see in the *Odyssey* some reference to knowledge of Italian, Sicilian, and north African waters acquired by the Greeks during the first phase of western colonization (*c.*750–650 BC): see, for example, Bradford's comparison of Odysseus' landfall among the Laistrygonians at *Odyssey*, 10. 87–97 with the (British Admiralty) *Mediterranean Pilot* account of Porte de Bonifacio in southern Corsica. Many such *periploi* appeared over the centuries, involving navigation all round the Mediterranean and also in the Atlantic, and in eastern waters too, after the voyage of Alexander's admiral Nearchus from the Indus to the Persian Gulf. Perhaps the most important of these is the *Periplus Erythraei Maris*, written by an Egyptian Greek about the middle of the 1st century AD: it describes routes around the coasts of east Africa and southern Arabia and the direct route, using the recently discovered monsoon, to the west coast of India.

Over time these two approaches to cartography, geography and chorography, drew on and enriched each other. For example, the huge map of the known world created by Marcus Agrippa at the behest of Augustus and displayed on a portico in Rome late in the 1st century BC was the result of the accumulation of chorographic as well as geographic information, while the huge engraved maps of the city of Rome created in the Flavian and Severan periods (of which stone fragments survive) represent the culmination of the tradition of detailed depiction of limited areas.

In the later Roman empire there seems to have been a decline in cartographic skill. For example, the mediaeval *mappae mundi* ("world maps"), which represent a mainly Christian development, are commonly circular or oval: they appear from as early as the 3rd to the mid-15th century and frequently have Jerusalem at their centre (especially from the beginning of the crusades), and their purpose seems to have been primarily didactic and moralizing. A similar development can be seen in the Greek east, where Cosmas Indicopleustes ("sailor to India"), an Alexandrian merchant and convert to Christianity (*c.*mid-6th century AD), wrote a *Christian Topography* in 12 books, in which the main tenets of spherical geography are rejected, the earth is seen as flat and rectangular, and the universe is a box-like structure, vaulted on top and resembling the biblical description of the Ark of the Covenant. However, this was probably not typical of the Greek east: besides the enormous mosaic map of Bible lands (*c.*24 × 6 m, of which 10.5 × 5 m survives, *c.*mid-6th century, from a church at Madaba in Jordan), depicting Jerusalem in considerable and accurate detail and showing some affinities to the Tabula Peutingeriana, *periploi* continued to be produced in the Byzantine era. These *periploi* are sometimes referred to as "Portolans", but the latter are a later, mainly western Mediterranean phenomenon, beginning *c.*1300 and involving use of the magnetic compass; there are a few Greek examples, but dating only from the 16th century.

The main Byzantine contribution to cartography came with the rediscovery of Ptolemy, of whom general knowledge seems to have died out in both the west and the east around 600, by the monk Maximos Planudes in 1295. The manuscript he found had no maps; so Planudes had a set made, and these so impressed the emperor Andronikos II Palaiologos that he had copies made for himself. There are two items to be noted here: first, there were in Constantinople *c.*1300 cartographers skilled enough to produce good maps from Ptolemy's text – cartography had not died out; second, all manuscripts (in the various recensions) of Ptolemy extant today are derived from Planudes's initiative. By 1406 there was a Latin translation of Ptolemy, dedicated to Pope Gregory XII, and the stage was set for the rebirth of European cartography.

Cassius Dio *c.*AD 164 –after AD 229

Historian

Cassius Dio originally came from the prosperous city of Nicaea in Bithynia in northern Asia Minor, but was probably taken to Rome as a boy when his father Cassius Apronianus became a senator. Thus Dio, born in the Greek east and brought up in Rome, had a dual heritage. Following in his father's footsteps, he entered the Senate under Commodus (reigned AD 180–92), was awarded a praetorship by Pertinax (AD 193), and, probably around AD 204, was made consul by Septimius Severus (AD

193–211). His career continued to prosper under Severus Alexander (AD 222–35), who in quick succession appointed Dio proconsul of Africa (*c.*AD 223), legate of Dalmatia (*c.*AD 224–26), and legate of Upper Pannonia (*c.*AD 226–28). These appointments were certainly prestigious, but Dio, who was no longer a young man, was thereby prevented from spending much time in either Italy (where he had a pleasant villa at Capua) or Bithynia. In the end, Dio did not forget his eastern roots, although much of his adult life was spent serving Rome around the empire. After holding his second consulship in AD 229, he retired to Bithynia to nurse his bad feet (80. 4. 2–5. 3). The precise date of his death remains unknown.

Dio's most important achievement is his monumental historical work, the *Roman History*, which was written in Greek and originally contained 80 books narrating events from the origins of Rome until AD 229. The Bithynian senator claims that the impetus to write history came from Septimius Severus. This emperor had so much enjoyed Dio's earlier work on the dreams and portents that heralded his principate that he wrote a letter to say so (72. 23. 1): that same night Dio dreamed that a divine power ordered him to write a historical narrative of Severus' rise to power, and the success of this work eventually resulted in Dio composing the *Roman History*. Today we have *Roman History* 36–55. 9 (covering the years 69–6 BC) almost intact, but the remaining books are preserved only in fragments and epitomes. Proudly Dio claims that he spent 10 years conducting historical research and 12 years actually writing the narrative until the death of Severus in AD 211 (72. 23. 5). This assertion is designed to generate confidence in the *Roman History* as a well-crafted historical work and echoes the claims of previous historians writing in Greek: Diodorus Siculus claims to have spent 30 years on his history, and Dionysius of Halicarnassus 22 years. Above all, Dio was influenced by Thucydides, from whom phrases, ideas, and techniques were borrowed. So, Dio's Fabius Rullus argues against excessive retaliation for a Latin revolt (fr. 36. 1) in a way that recalls Thucydides' Diodotus during the Mytilenean debate. Dio's stylistic and intellectual debts to the 5th-century BC historian Thucydides can be seen as symptomatic of the Greek cultural revival known as the Second Sophistic.

At the same time, Dio owed much to the Roman historiographical tradition. For chronology the *Roman History* uses the official Roman year dated by consuls as the principal structural device, but, like Tacitus, Dio does not allow himself to be restricted by this potentially rigid annalistic format. So Dio organizes material along biographical lines, particularly when narrating the principate: individual emperors are often both introduced and allowed to leave the stage with separate character sketches. Likewise, Dio was prepared to narrate events that spanned several years in one continuous segment of narrative, particularly in the case of foreign campaigns (49. 19–33). Moreover, he clearly knew Latin: he appears to have read Seneca's *Apocolocyntosis* (60. 35. 3–4) and laments the fact that he cannot find a direct equivalent for the Latin word *auctoritas*, which he transliterates in Greek (53. 3. 4–5).

Ideologically, Dio valued the stability created by the principate and observed pithily that "Monarchy sounds unpleasant, but it is the most practical form of government under which to live" (44. 1. 2). This stance does not make him uncritical of incompetent emperors, and even Septimius Severus, who inspired Dio to write history, is given a balanced treatment. We are repeatedly offered perspectives on the principate that reflect the senatorial point of view. So, when Commodus decapitates an ostrich and brandishes the head at the senators, Dio discreetly hints to his colleagues that they can avoid laughing by chewing on the laurel leaves of their crowns (72. 21. 1–2). In his narrative Dio's judgement on particular emperors often rests on how well they treated his fellow senators.

Nor does Dio's general approval of the imperial system lead him to ignore the difficulties of historical inquiry under the principate, when the size of the empire and the secrecy in which important decisions were taken made it difficult to reconstruct events (53. 19). Dio, who spent his professional life working under the emperors, was fascinated by the transition from republic to principate, as is clear from the fact that the *Roman History* devotes much more space to this period than to any other. Today historians especially value Dio's sophisticated and clear narrative of the triumviral era, and passages such as the unusually frank reassessment of Cicero (38. 12) show that Dio can offer us valuable alternative perspectives on leading historical figures of the period. Perhaps Dio's own experiences of confronting turbulent armies in Pannonia (80. 4) may have sharpened his interest in the triumviral age as a whole.

Dio was the last substantial writer of annalistic history from the ancient world whose work is at least partly extant. The Byzantine scholar Photios had read Dio and regarded him as a much clearer writer than Thucydides. Perhaps this enthusiastic response was partly because Dio's subject matter in the *Roman History* must by its very nature have appealed to educated readers in the Byzantine world, who saw their state as a continuation of the Roman empire. Many fragments of the *Roman History* have survived thanks to the efforts of the excerptors who worked for the emperor Constantine VII Porphyrogennetos (913–959). There is a useful epitome of books 36–80 made in the late 11th century by John Xiphilinos, who selected episodes from Dio that he regarded as particularly entertaining or enlightening. Moreover, early in the 12th century, John Zonaras wrote an *Epitome of Histories*, which was a universal history documenting events from the creation until AD 1118. A comparison between the *Epitome* and extant portions of the *Roman History* shows that Zonaras tended to paraphrase Dio fairly freely, but the Byzantine historian did preserve a version of *Roman History* 1–21 (now lost), which served as one of his chief sources for early Roman history. Subsequently, in Paris, the king's printer Robert Estienne produced in 1548 the first printed edition of Dio's *Roman History*, which ensured that the work was widely read. Finally, Dio's *Roman History* was competently edited by U.P. Boissevain (1895–1931), and his text still serves as the starting point for most modern editions.

Biography

Born at Nicaea *c.*AD 164, Cassius Dio was educated in Rome and followed his father into the Senate. He held the consulship twice and after the second time (AD 229) he retired to Bithynia where he died (date unknown). Dio wrote in Greek a *Roman History* in 80 books,

taking events from the origins of Rome to his own day, of which about 20 books survive intact (covering 69–6 BC) and fragments of the rest.

Catalans

The origins of Catalonia and the Catalan language lie in the break-up of the Roman province of Tarraconensis by its Visigothic rulers before the invasion of Muslim armies from north Africa in the early 8th century AD. In 801 Charlemagne conquered Barcelona and in 865 the Spanish March based around Tarragona, Barcelona, and Girona was set up by Charles the Bald (843–77). It was he who appointed Guifre or Wifred the Hairy as count of the Spanish March. Latterday Catalans view Wifred's reign (870–97) as the beginning of a distinct Catalan political and cultural identity. In 1151 the crown of Aragon and the county of Barcelona were united by marriage. The two areas remained distinct but in a political confederation united by their count-kings. It was in the reign of James I (1213–76) that the commercial and territorial horizons of Aragon-Catalonia were dramatically enlarged and the maritime potential of Catalonia was extended from a local to a Mediterranean-wide role.

In the years 1229–31 the island of Majorca was conquered. By the mid-1280s the merchant marine of Barcelona and Majorca had established regular sailings to Meson, Palermo, Tunis, Alexandria, and Constantinople and outside the Straits of Gibraltar to Morocco, England, and Flanders. Catalan was set fair to be one of the commercial languages of the Mediterranean in the 14th century.

Politically and militarily the Aragonese-Catalan confederation took a major role in Mediterranean politics from the 1280s. As David Abulafia has pointed out, it is not clear whether trade followed the flag or whether the monarchs of Aragon-Catalonia had their political interests dictated by the commercial interests of their merchant communities. In 1282 Peter III of Aragon (1279–85) became king of Sicily through the right of his wife Constance, the granddaughter of the emperor Frederick II, and following the Sicilian Vespers, which had expelled Angevin garrisons from the island. The long and bitter war of the Sicilian Vespers (1282–1302) between the Angevins and their Aragonese rivals was to have repercussions for the Aegean area and for Catalan involvement in that region. In 1315 the Angevin–Aragonese struggle for Sicily spilled over to the Peloponnese when Ferrando of Majorca, cousin of the Aragonese ruler of Sicily, sought to wrest control of the principality of Achaea from the Angevin-backed ruler Louis of Burgundy. After a good beginning, Ferrando's overconfident behaviour led to his defeat and death at the Battle of Manolada near Elis on 5 July 1316.

The Treaty of Caltabellota (1302), which brought an end to the war of the Sicilian Vespers, also threw many Catalan mercenaries out of a job. Those in Aragonese employ in Sicily found a new war and a new employer in the Byzantine emperor Andronikos II Palaiologos who in 1303–05 used them to fight the Turks. Falling out with Andronikos, this Catalan Grand Company moved west to Thessaly, plundering its way there through the Byzantine provinces of Thrace and Macedonia, ostensibly in the pay of Charles of Valois who used their presence in the region to support the claims of his wife Catherine de Courtenay as titular Latin empress of Constantinople. In 1310 they were employed by Gautier de Brienne, the duke of Athens, to further his interests in Thessaly and they captured Domokos and Halmyros for him. In 1311 Gautier wished to dismiss most of his Catalan mercenaries now based at Halmyros. These defied him and he was forced to send an army to remove them. On Monday, 15 March 1311 the Frankish army of more than 700 knights was annihilated near Halmyros and control of the duchy of Athens and Thebes passed to the Catalan Company. In 1312 they recognized the overlordship of Frederick II of Sicily (1296–1337). Catalan rule over the duchy lasted until 1388.

PETER LOCK

Summary

From their capital Barcelona the Catalans became a major commercial and maritime power in the 13th and 14th centuries. Having fought in Sicily as allies of the Aragonese, many Catalans found employment as mercenaries to the Byzantine emperor Andronikos II

who used them to fight the Turks in 1303–05. The duchy of Athens and Thebes was ruled by the Catalan Company from 1311 to 1388.

Catana

City in Sicily

The city of Catana lies on the coast in the centre of eastern Sicily, its harbour facing the Ionian sea – an excellent site for a port. It occupied the north side of a fertile volcanic plain in the shadow of Mount Etna; its sister city, Leontini, was situated to the south. No doubt the intention of the Ionians in founding the two cities was to control access to the rich agricultural plain. Catana was also located near a delta formed by three major river valleys reaching westwards into the interior, which was occupied by Sicels.

The Ionian colony at Catana was founded *c.*729 BC by Chalcidians from the mother colony of Sicilian Naxos, itself founded by a group of Chalcidians from Euboea. The *oikistes*, or founder, was Euarchus. In the early period a great variety of Greek pottery – Corinthian, Athenian, Chalcidian, Chian, East Greek, and Spartan – indicates that the native Sicels were well acquainted with the Greeks, primarily through trade. Once the Ionian colonists settled on the site, relations appear to have been relatively peaceful, with the archaeological evidence suggesting that the two groups lived amicably side by side. Thucydides (6. 2), however, says that the Sicels retreated inland and to the north with the arrival of the Ionians on the east coast of the island.

Catana was autonomous in the Archaic period, with a very active political and economic life. Greek goods gradually made their way into the interior along the river valleys; archaeological evidence indicates that the area was fairly well Hellenized by the end of the 6th century BC. The lawgiver Charondas (*c.*500) established one of the earliest codes of Greek law, pertaining primarily to the giving of evidence in court and rules governing contracts. These laws were successful in retaining aristocratic power without dissension among the colonists, and his law code became famous throughout Greece. Stesichorus, the choral lyric poet, was also resident in Catana at this time. Only fragments of his work survive, but they show that his treatment of myth was an important stage in the transition from epic to tragedy in Greek literature.

By the early 5th century BC the city had lost its autonomy and was under Syracusan control. In 475 Hieron I, tyrant at Syracuse, invaded Catana and expelled the inhabitants. He repopulated the site with Dorians and mercenaries and renamed the city Aetna, setting up his son Deinomenes as ruler, but the Catanians returned in 461 and the old name was restored. Later in the century, during the Sicilian expedition (415–413 BC), the city supported Athens, which used it as a base for attacks against Syracuse. When the Athenians were defeated, the city was occupied by Dionysus I, another tyrant ruling at Syracuse, who sold the entire population into slavery and settled his Campanian mercenaries there. From then on Catana formed part of the Syracusan empire. Diodorus Siculus (14. 59. 2) relates that the lands were given to the Sicels with the Ionians remaining in exile until 358, when the survivors moved to Tauromenium (Taormina). The Campanian mercenaries still inhabited Catana when it was conquered by Rome in 263 BC during the First Punic War.

In the 5th century the city was celebrated by the poet Aeschylus in his now lost play *The Women of Aetna* (*c.*470 BC), and it was the centrepiece for Pindar's *Pythian* 1, a choral lyric composed for the festival in honour of Apollo at Delphi, at which the major event was a musical competition for a hymn to the god.

Little is known about the physical appearance of the Greek city, as its remains were largely obliterated by the lava flow of 1669. Architectural fragments on the acropolis, a sanctuary of Demeter, long theatre walls, and the contents of Hellenistic graves outside the ancient city, do however attest to its presence.

In the 2nd and 1st centuries BC the city was given the status of a *civitas decumana*, flourishing under the Roman Republic, although it suffered damage in the First Slave War (135 BC). Catana became a Roman colony under Augustus (21 BC). Most of the extant physical remains in Catana date to the Roman imperial period, when the city was very prosperous. Having maintained and improved its port facilities, it served as a centre for the shipment of timber and basalt millstones.

The vast majority of Sicilian craftsmen were Greek-speaking, and the epigraphical evidence indicates that even into the Roman period roughly half the population on the island still spoke Greek, while the other half spoke Latin. The Greek calendar continued in use into the early imperial period, and the year was officially dated according to the eponymous priesthood of Zeus Olympios at Syracuse. It appears that Sicily was never fully Romanized and that Greek was widely spoken, especially in the rural areas, which were hardly affected by the Roman incursion. In fact, much of the island seems to have remained Greek until the end of the Roman empire. Catana retained its importance through the Byzantine period, and was one of the first and most important Christian communities in Sicily.

The Chalcidians were the earliest and most prolific colonizers on the eastern coast of the island, laying claim to the whole northeastern part of Sicily in two decades with the establishment of colonies there – one of the first settlements was located at Catana. Through peaceful coexistence with the native Sicels, Catana was a vital factor in the establishment of a Greek foothold on the eastern coast of the island, controlling as it did the agricultural products of the fertile volcanic plain and, by

virtue of its excellent harbour, serving as a base for Greeks trading with settlements further to the west along the shores of the Mediterranean Sea. Catana played an important role in the Hellenization of the eastern central part of the island, a process so successful that the city was emblematic of a strong Greek presence in Sicily long after it became part of the Roman empire.

Caucasus

Region between the Black Sea and the Caspian Sea

The Caucasian mountains, which, with their many rivers, lakes, and passes, divide the northern Caucasus from Transcaucasia, were familiar to the Greeks, but they knew only the name and massiveness of this range. Herodotus was the first to give information about the mountains and the peoples who dwelt there, living a primitive and barbarian life. Alexander the Great was mistaken in thinking that the Hindu Kush was part of the Caucasian range. Although Strabo gives a good description of the mountains, ancient authors were wont to mislocate them to or conflate them with the Urals as well as the Hindu Kush.

This very distant and mysterious mountain region had its place in Greek mythology. The Caucasus was the land of Arimasps and of griffins, who guarded its gold treasure. Prometheus, having stolen the secret of fire and given it to man, was punished by being chained to Mount Elbrus, one of the highest peaks in the Caucasus, while an eagle sent by Zeus picked continuously at his liver until he was unbound by Heracles, who slew the eagle. There are several local versions of the myth and cult of Prometheus. In Georgian folklore Prometheus is called Amirani. In Greece itself there are many other versions: for example, in Athens he was worshipped by potters and in the Academy; in Thebes one of the Cabiri is named Prometheus and his son is Aetnaeus.

To the south of the Caucasian mountains lies Transcaucasia, known to the Greeks as home to the ancient civilizations of Colchis, Iberia, Armenia, and Albania, the first three being familiar to them but the latter beyond their interest and involvement.

Colchis was the best known thanks to the establishment of the Ionian colonies of Phasis, Gyenos, and Dioscurias on its Black Sea coast in the mid-6th century BC. In Greek imagination Colchis was the final destination of Jason and the Argonauts, who sailed there to retrieve the golden fleece. This, one of the most popular Greek myths, had a very strong impact on ancient art, and over several centuries artists depicted scenes from it. One of the most popular figures in Greek literature and art was Medea, the barbarian Colchian princess, granddaughter of Helios and daughter of Aeëtes, king of Colchis. Thanks to her sorcery and love Jason was able to depart from Colchis with the golden fleece; he also took Medea, and later married her. When he attempted to repudiate Medea she killed their children. The popularity of herbal medicines in ancient Greece was linked to Medea and her magical powers.

For Greeks Colchis was a land rich in gold, iron, timber, and honey. Ancient authors state that these natural resources and raw materials, together with slaves, were exported to Greece. In their writings it was alleged that particles of gold were washed up by the mountain streams of the Caucasus, and that Colchians used to place fleeces in the water to catch them. This is but one of many interpretations of the golden fleece in ancient Greek literature. It is thought that when Greeks initially arrived in the vicinity of Phasis they saw a very beautiful species of bird, previously unknown to them, which they started to export to Greece. They named it "bird from the Phasis river" (pheasant).

Colchian elite culture was strongly influenced by Greek. This is reflected in architecture, sculpture, goldwork, etc. Greek craftsmen were employed; the cults of Apollo, Dionysus, Helios, Heracles, and the Dioscuri were common; Greek was widespread as the official and religious language. Greek influence continued via Byzantium from the 4th century AD with the adoption of Christianity as the state religion of Egrisi (successor to Colchis; modern western Georgia) and Iberia (eastern Georgia). Early Christian church architecture showed strong Byzantine influence, and the Georgian Church itself was a

Byzantine offshoot. In the medieval period, Georgian icons were opulently decorated with enamel, initially influenced by Byzantine practice before a distinct Georgian school grew up (as was the case with religious mural painting and mosaics). A new wave of Greek settlers (known as Pontic Greeks) appeared from Anatolia in the wake of the Graeco-Turkish conflicts of the later 19th century. They settled in western Georgia in new villages which they established, and preserved their linguistic and cultural identity. Many "returned" to Greece following the collapse of the Soviet Union.

Iberia and Armenia were subject to weaker Greek influence. The predominant external influence was Achaemenid Persia. But the subsequent creation of Hellenistic kingdoms in the east brought the full weight of Hellenic culture to bear. This was reflected in the layout and architecture of cities, in crafts, and everyday life. Armenia was also Christianized and enjoyed close links with Byzantium.

GOCHA R. TSETSKHLADZE

Summary

A region to the east of the Black Sea, between it and the Caspian, the Caucasus was known to the ancient Greeks as a distant land of mysterious mountains. Many legends were located there. The Transcaucasian regions of Colchis (western Georgia), Iberia (eastern Georgia), and Armenia were Christianized early and subject to Greek influence. Many Pontic Greeks settled in western Georgia in the 19th century.

Cavafy, Constantine 1863–1933

Poet

Constantine Cavafy is widely regarded as the most important poet of modern Greece. Although he was contemporary with Kostis Palamas and began publishing in the same year (1886) as Palamas did, Cavafy's main creative period coincides with Palamas's decline. For Cavafy was, in his own words, "a poet of old age"; he did not reach poetic maturity until he was 40. Thus Palamas belongs more to the 19th century, while Cavafy is a poet of the 20th century, both chronologically and in spirit.

Cavafy has often been regarded by Greek critics as sui generis, since the Greek literary currents of his own day had little detectable influence on his mature poetry. This view, however, ignores the profound and lasting impact of Cavafy's English education, his exposure to Byzantium through Gibbon, his initial encounter with the Classics in English schoolbooks, and his extensive knowledge of English literature. Even Cavafy's metrical experiments can be traced to English prosodic forebears. Thus, rather than coming from nowhere in literary terms, Cavafy can more plausibly be seen in the context of the English schooling he received between the ages of 9 and 16 in Liverpool and London.

Cavafy shows little interest in the preoccupations of late 19th- and early 20th-century Greek poetry: irredentism, the Greek landscape, and folk poetry. He does not advert constantly to Greece's glorious Classical past, preferring instead to explore the unfashionably decadent Byzantine and Hellenistic periods. The increasingly explicit homoeroticism of Cavafy's love poetry is another discordant feature, by contemporaneous standards.

Cavafy's enduring interest in Byzantium dates from a very early stage in his poetic career. The reason for this interest may well be connected with the fact that Cavafy had family roots in Constantinople. A second factor is that, for a Greek of the diaspora, late antiquity, when the centre of Hellenism was no longer Athens, held a particular fascination. Cavafy was able, by means of Byzantium, to lay claim to an elevated genealogy, both for himself (as a descendant of the Phanariots) and for his poetry, as central to (through being descended from) the poetic tradition of Byzantine Egypt, rather than peripheral to the modern Athenian school. Between 1882 and 1885 Cavafy lived in Constantinople. It was probably during this period that he began to acquire his prodigious knowledge of the Byzantine empire and its chroniclers.

Cavafy described himself as a "historian poet", and the vast majority of his poems are set in the recent or distant past. He divided his poetry into three categories: historical, philosophical, and erotic. Although there is some overlap between these categories, Cavafy's thematic collections (the most finalized arrangement of his poems) follow this distinction, grouping poems according to their predominant theme. In the historical sections of his thematic collections, poems are arranged in chronological order of the events to which they refer.

The philosophical poems, which have sometimes been called "didactic" by critics, are fewest in number and mostly fall into the earlier section of Cavafy's recognized (or canonical) poetry. Like many of Cavafy's poems, the philosophical poems can be read on two levels: as straightforward moralistic advice, or as satires on heroic attitudes.

The historical poems often take as their focus minor characters, such as Cleopatra's son Caesarion, or major characters in ignominious moments. Antony is depicted after his defeat at Actium, consoling himself with illusions of the Alexandria he will never reign over. Byzantine emperors are seen wearing jewels made of glass, or taking the schema in indecent haste just before dying, or again abandoning their finery like an actor's mask to sneak away. The historical moment is often one of transience: Christanity is replacing paganism; empires are crumbling; cultures, ideologies, and languages are under threat.

Cavafy's erotic poetry is distinguished by an apparent absence of higher sentiments, and a preoccupation with physical beauty and pleasure. Set in the past, these poems form a commentary, as do the historical poems, on historiography and the relationship between time, memory, and art. The erotic poems include epitaphs and poems of poetics. The epitaphs focus on beautiful, prematurely deceased, young men, who have usually lived lives of unbridled pleasure. The poems of poetics talk about art, mostly in the first person. One of the

Constantine Cavafy, Alexandrian poet

best-known erotic poems, "To Sensual Pleasure", describes this as sacred and the most important thing in life.

Cavafy was among the first Greek poets to break away from conventional metrical forms, though his experiments are by no means as extreme as those of Sikelianos in "Prologue to Life". Most of Cavafy's poetry is iambic, but line lengths vary, and syncopation and enjambment are widely used. His principal use of the 15-syllable line is for ironic effect. He is also very sparing in his use of rhyme, and never employs it for purely decorative effect. The prosodic understatement of Cavafy's poetry has led to its being perceived as prosaic, and Palamas famously dubbed it "historical journalism".

Cavafy's language is original, even idiosyncratic. It is quite unlike the intentionally poetic demotic of Palamas and his Athenian contemporaries, and makes frequent use of katharevousa morphology and syntax and also of Constantinopolitan idioms. Extreme demoticists and katharevousa supporters alike viewed this mixed language with hostility, and Palamas described Cavafy as "the Karaghiozis of demotic". Cavafy retaliated publicly by politely explaining that he could not understand Palamas's kind of lyricism, and privately by referring to his second-rate brandy as "the Palamas brandy".

Cavafy's reputation in Greece was largely founded posthumously. Admired during his lifetime by a small circle of Alexandrian literati and by a handful of foreigners, most notably E.M. Forster, with whom he became friendly in 1917, Cavafy was virtually ignored in Greece until the last decade of his life. Cavafy's idiosyncratic methods of disseminating his work, in privately printed pamphlets, broadsheets, booklets, and hand-pinned looseleaf collections, were a contributing factor in this lack of recognition. The first published volume of Cavafy's poetry appeared posthumously in 1935. As a perfectionist, constantly revising and even discarding his work, Cavafy seems to have been reluctant to make his poems publicly available in a permanent form.

Cavafy's work has proved puzzling, even to his admirers. Timos Malanos, who was the first to attempt a critical account of it, placed great emphasis on Cavafy's homosexuality, reading the poetry in Freudian terms as a mask for private obsessions. The Marxist critic Stratis Tsirkas attempted to read Cavafy's poems as veiled political allegory. A more influential approach has been George Seferis's attempt to demonstrate that Cavafy used the so-called "mythical method" of Eliot and Joyce, developing a constant parallel between past and present, although this approach may more fruitfully be applied to Seferis's own poetry. Perhaps more useful is the approach of Nasos Vayenas, who views Cavafy's poetic method as a continuous refining of the language of irony. As Cavafy himself, who remains the subtlest critic of his own work, pointed out, the pleasure derived from his poetry is intellectual, rather than emotional.

Cavafy's posthumous influence on Greek poetry, but also on world poetry, has been enormous. His description of himself, in a satirical French press release of around 1930, as "an ultra-modern poet" and "a poet for future generations" has proved uncannily accurate.

Biography

Born in Alexandria in 1863, Cavafy was the son of a wealthy merchant. Educated in England, he lived in Constantinople from 1882 to 1885 and thereafter in Alexandria where he worked for the Egyptian Ministry of Irrigation. His first (privately printed) collection of poems appeared in 1904 but he was little known outside his own circle of literati. He died in 1933 in Alexandria.

Celibacy

Celibacy refers mainly to a religious attitude towards sexuality that stresses physical chastity and the negation of carnal love. "Celibacy" must be distinguished from "virginity", which implies lifelong sexual abstinence. A virgin body is a celibate body, but the opposite is not necessarily true. Both terms designate not only a particular physical state but also a spiritual one, and sometimes are used interchangeably. The meaning of the Greek term *agamia* (celibacy) can best be understood by its opposition to *gamos* (marriage). In the cultural milieu of Greece, marriage for both sexes is axiomatic. Celibacy, therefore, is unacceptable, unless it is employed in the religious sphere. It is only within this context that celibacy offers to an individual an unconventional but socially acceptable alternative to traditional gender roles. Celibacy, therefore, in the Greek case, is used to indicate the unmarried state of bishops and monastics and in some cases of dedicated religious devotees.

By definition celibacy implies self-sufficiency and separation. It points to a hierarchy of relationships with the divine and establishes superiority. The celibate becomes the symbol of purity and the conveyor of special religious powers. In antiquity sexual abstinence was demanded of priests and priestesses of certain deities. However, in the case of priestesses the main idea of celibacy was that they lived in marital relation to the divine. Thus, old peasant women that could no longer have sexual intercourse were chosen for the position of Pythia at the

temple of Apollo at Delphi, serving as "brides" of the god. A few days of sexual restraint were also required of participants in the cults and this was probably connected with the idea that sexual intercourse is polluting because it opens the possibility of demonic infection. As far as male celibacy in antiquity was concerned, one could distinguish two types: first, that of the priest whose celibacy was demanded for purely ritualistic reasons; and secondly the philosophically grounded celibacy of such groups as the Pythagoreans and the Stoic philosopher Epictetus, who saw the philosopher's task as necessitating a detachment from the mundane requirements of family care. Yet, it is worth noting here that in pre-Christian times celibacy was also considered, particularly by the Athenians, as "evil" because it prevented the reproduction of the human race and negated the "natural laws" of human existence. Plato and Plutarch even mention that special laws existed against celibacy.

Though in antiquity celibacy seemed primarily to serve a ritual function, in the early Christian Church it came to serve an ethical one as well. The celibate state was extolled by the Church Fathers and from then on was regarded as explicitly superior to being sexually active, even within the context of marriage. In the first centuries of Christianity, due to eschatological expectations, many Christians chose to live in celibacy, for, "when they rise from the dead, they neither marry nor are given in marriage, but are like angels in heaven" (Mark 12: 25). In the beginning, both celibate men and celibate women lived in the same communities and this cohabitation of the sexes was viewed as involving a more rigorous ascetical effort. Thus was created the institution of *syneisakton parthenon* or the *subintroductae* (celibate women cohabitating with clerics or monks), which, however, was condemned by the First Ecumenical Council in 325 (canon 3).

Celibacy as an anticipation of the "angelic life" led some monastics to the egotistic belief that this state of being was superior to the one followed by married Christians, and created a conflict with the ecclesiastical administration. Around 340 the Council of Gangra threatened with excommunication all those who believed that no person living in a state of marriage had any hope of approaching God. The Church Fathers defended the positive value of the nuptial union against any form of heresy which denied the body and the realities of marriage. They argued that marriage and celibacy, although they involved different practices, were based on the same theology and spirituality. Moreover, both celibacy and marriage were perceived by them as referring to a spiritual state of interiorized chastity – a chastity of the soul and mind. It is worth noting here that, when the Fathers spoke of virginity and celibacy, their positions were frequently antithetical and complementary. Thus, one cannot reduce them simply to a single insight. However, St John Chrysostom, who may be regarded as the best explicator of the essence of marriage, argued that its sum and substance is love and its main purpose the unification of humankind. Such love may be carnal at the outset, but gradually it should become spiritualized. Here, celibacy emerges as the natural development of marriage.

This positive view of marriage is also apparent in the context of sacerdotal celibacy, which was regarded in the East as a matter of personal choice. In the West the Council of Elvira (306) decreed the obligatory celibacy of all priests and bishops, but the eastern Churches were disinclined to take this position, hence allowing wedded bishops and priests as long as they had been married only once and their wives were neither widows nor divorcees (Apostolic Canon 17, 18). However, a later development of canon law reserved the highest ranks of the Church to unmarried clergy. This rule was established first in 528 by Justinian I and was confirmed by the decrees of the Quinisext Council in 629. Celibacy became mandatory for bishops by the 12th canon of the Council in Trullo (692), which remained in effect throughout the Byzantine era: readers and cantors could marry after ordination, while ordained priests, deacons, and subdeacons could retain already established marriages. Bishops, however, had to be separated from their wives, who had to enter a convent. Today Greek Orthodox priests are allowed either to marry or to take monastic vows prior to ordination. Thus, a hierarchy has been established in the Church in which the male celibates occupy the highest ranks. Wedded clergy are considered as spiritually advanced only when abstaining from sexual relations, a requirement for the celebration of the Eucharist. Such a view is derived from the association of purity with celibacy and of sexuality with pollution, particularly in the sacred sphere.

Celibacy is also a prerequisite for both male and female Orthodox monastics, who take vows to remain chaste. In this context, celibacy is considered necessary for spiritual advancement and is also viewed as betrothal to Christ in imitation of his union with the Church. It is worth mentioning, however, that women in the early Church were seen as having a greater need for celibacy than men, not only because they had an opportunity to serve God but also as a means of redemption. Although the institutional celibacy of nuns today is not connected with sacerdotalism, in the early Church it was associated with the order of deaconesses who, like deacons, were ordained to their office and assisted bishops and priests in the pastoral care of the faithful and especially of women. The Fourth Ecumenical Council in 451 prohibited marriage after ordination for deaconesses (canon 15) who were mainly selected out of female monastics, widows who had been married only once, or bishops' wives.

In Greece today non-institutional lay celibacy is found in the context of religious brotherhoods and sisterhoods, whose members choose to remain unmarried out of devotion, without, however, taking any monastic vows to that effect. This type of celibacy concerns particularly women since in the Greek cultural context there is no place for spinsterhood.

Censorship

Censorship is a means of preventing the expression of ideas, speech, or behaviour. Social, religious, political, military, and other authorities practise censorship in the name of the common good of society, seeking to protect it from heresy, obscenity, treason, or ideological error. In one form or another censorship has existed universally throughout Greek history.

Most of the censorship among the ancient Greeks occurred over religious and political ideas. The common charge was impiety (*asebeia*). Since they believed that the gods could actively help or harm the city state, impious behaviour that might invoke divine wrath was punished. Sparta imposed a rigid system of censorship to protect its militarism: books, music, and even learned men were banned. Greek tyrants exercised censorship to silence and eliminate their opponents. Generally speaking, under the tyrants, and many other rulers, censorship was identical with harsh repression.

Artists were not usually censored, but one notable exception in the first half of the 4th century was the case of the Athenian courtesan Phryne, who was charged with impiety because she modelled for a nude statue of Aphrodite by Praxiteles. Hyperides, pleading her case, tore her clothes off at the height of his defence, and asked the all-male jury if there was anything about her body that was offensive to the gods or man. She was rather quickly acquitted.

Censorship of playwrights occurred on a number of occasions. Euripides, who played no active political role, was charged with *asebeia* by Cleon, as were other dramatists including Aristophanes. Humour was sometimes used to censure behaviour through the weight of public opinion, becoming thereby an unofficial form of censorship to those afraid of being satirized. Those mocked would occasionally seek to punish the jokers. Plato in the *Laws* advocates censorship of those forms of comedy that are cloaks for vicious personal attacks. Tragedies could also be banned. In 493 BC a tragedy written by Phrynichus and produced at the Dionysia on the theme of the failure of the Ionian revolt, and the fall of Miletus deeply moved the audience; fearing turmoil, the authorities fined Phrynichus and banned the play.

Athens, though democratic, censored many thinkers, artists, and intellectuals; they were exiled, imprisoned, or executed, or they took flight. Aeschylus was accused of violating the secrecy of the Eleusinian mysteries. Phidias was also accused of impiety and fled to Olympia. Protagoras, the famous sophist, was censored for his remark "Man is the measure of all things." Accused of atheism, he was banished from Athens and certain of his books were burned.

The beliefs of the Greek philosophers laid them open to various charges. Xenophanes criticized the morality of the Olympian gods as portrayed by Homer and other poets, arguing that their behaviour was shameful. This generated complaints of atheism (impiety) against him. Similarly, Anaxagoras of Clazomenae (*c.*500–428 BC) had argued that the sun was a hot rock. Convicted of impiety, he was banished from Athens and died in exile at Lampsacus. The real motive for the prosecution was probably to embarrass his patron Pericles.

The most famous case of censorship of a philosopher was the trial of Socrates on charges of corrupting youth (the moral charge) and impiety (the religious charge). The resulting judicial murder on these trumped-up charges was to have a profound influence on many including his most famous pupil, Plato. Oddly it is Plato who in the *Apology* stated the implications of a refusal to accept censorship, and later in the *Republic* himself instituted a system of censorship.

Plato's *Republic* has been widely read since it was first written and it has influenced many who would seek to impose censorship. Plato believed that whatever entered the soul would either develop it or corrupt it. In his utopian Republic a system of censorship is described that would mould the minds of all citizens, but especially the Guardian class, through a system of censored education. This included censorship of music, for Plato believed that music could have a profound impact on the soul and that it was important that the right music be heard at the right time. It should be noted that on several occasions intellectuals sought to censor those they disagreed with; Plato, for instance, wanted to burn the works of Democritus.

Aristotle also advocated a form of educational censorship in his *Politics*. Following the death of Alexander the Great, Aristotle himself became a victim of censorship. He was charged with impiety, but fled "lest Athens sin twice against philosophy".

During the Hellenistic period many states adopted a policy of punishing external political threats quickly, but they usually

left native populations and cultures alone. One notable exception was the Seleucid policy of forced Hellenization, which censored any opposition to assimilation. This policy was violently resisted by conservative Jews, whose resistance and success in arms is described in the books of Maccabees and still celebrated at the festival of Hanukkah.

The establishment of great libraries at Alexandria and elsewhere led to two forms of literary censorship. When editors collated manuscripts, they often found variants in the copies and decisions had to be made about which was the "correct" version. Editors could also make important changes when issuing new editions of older works and thereby influence the interpretation of the text.

The other form of literary censorship was mob rule. On a number of occasions mobs or conquerors sacked and burned libraries. The library at Alexandria was damaged and burned during Julius Caesar's siege in 42 BC, by Christians in AD 391, and by Muslims in AD 642. In the Christian era political charges were brought against missionaries and other Christians. Because the worship of the emperor was equated with political loyalty, the Christian refusal to comply led to their persecution – in effect a violent form of censorship. St John was exiled to the island of Patmos and some scholars believe that the apocalyptic style of the book of Revelation was a religious cover that enabled the book to get past the censors.

With the conversion of the emperor Constantine and the legitimization of Christianity, a brief period of toleration occurred, which ended with the triumph of Christianity as the only licit religion. Under the emperor Theodosius I pagan religions were proscribed, sexual regulations were imposed, and the Olympic Games stopped. Theodosius, like Constantine before him and others after him, repressed unorthodox beliefs. The union of Church and state meant that heresies contrary to the Nicene Creed were viewed as political opposition and thus deserving of censure. The emperor Justinian I, seeking political unification through theological orthodoxy, also persecuted heresies, and he closed the philosophical schools in Athens (AD 529).

In the 8th century the iconoclasts vigorously censored the veneration of icons; the two periods of iconoclasm lasted for more than 80 years in total. The Latin conquest of Constantinople in 1204 and the occupation of its western lands led to the censorship of Orthodoxy and of other expressions of Greek culture, and it was only in 1261 that the restoration of Byzantine rule liberated most of the people. The Ottoman conquest involved the suppression of Greek faith and culture to a certain extent, but underground schools sought to preserve and extend Greek faith, language, and culture.

After Greek independence censorship took the forms typical of the modern nation state whose primary concern is state security from political enemies. Political challenges were usually suppressed. Political censorship was, however, limited by a general lack of opportunities in the undeveloped Greek state. One exception was the attempt of the Greek government to standardize Greek through the imposition of a pseudo-Classical language (katharevousa). Efforts were made to develop this artificial variant of Greek at the expense of the demotic form.

From World War I until late in the 20th century Greece experienced typical patterns of wartime censorship, or censorship of unpopular groups. In June 1925 the military rule of General Theodore Pangalos attempted sumptuary legislation to define the length of women's skirts. By the 1930s more serious efforts were made to censor the Greek Communist Party (KKE). In 1936 General George Metaxas became the virtual dictator of Greece and his nationalist ideology led to many forms of censorship. School textbooks either followed the nationalist line or were censored. Youth organizations were established to spread nationalist propaganda and rival organizations such as the Boy Scouts were banned.

During the German occupation in World War II ruthless Nazi censorship was imposed. Reprisal and intimidation occurred in a number of places. In the years after the war the right wing was able to suppress the leftist partisans and communists. In October 1947 the newspapers of the Greek Communist Party and of other leftist groups were banned and prisons were filled with their members.

The election of George Papandreou as Prime Minister in 1963 led to the adoption of policies of reconciliation that sought to end the civil strife of the previous decades and eliminated most censorship. The short-lived Papandreou government was followed by the coup d'état of the military junta in 1967. The lengths of women's skirts and of men's hair were subject to regulation and the media was rigorously censored. In 1974 the junta was replaced by the Karamanlis government and a new democratic era began. Most forms of censorship were then ended.

The current constitution of Greece shows a serious effort to balance individual rights with the responsibility of the government to protect society, but despite its high regard for "the rights of man", censorship is built into it. The Eastern Orthodox Church is described as the "prevailing religion" and translations of the Bible are forbidden unless given "prior sanction by the Autocephalous Church of Greece and the Great Church of Christ in Constantinople" (Article 3). According to Article 13 "Proselytism is prohibited", which means that the preaching of any faith other than Greek Orthodoxy is prohibited. Article 14 declares that the press is free and prohibits prior censorship, but seizure before or after circulation can be done if a publication "offends against the Christian or any other known religion; insults the President of the Republic; discloses state secrets (especially military secrets); or is obscene". Press offences must be punished according to law. The limited freedom of the press is not applied to other forms of mass communication. Article 15 permits censorship of electronic media and the film industry. The objective of communications control is to further the social and cultural mission of the country.

Ceremony, Byzantine

The ceremony (*katastasis* or *taxis*, "arrangement") is a structure of rules and formulas intended to organize social coexistence. The actions, words, and gestures that accompany a ceremony often took on a symbolic character. Ritual actions mark important phases in the life of the Byzantines. Private processions, for example, could be performed for personal celebrations such as weddings, or for funerals; official processions were held by different social groups such as students, guilds, clergymen, and civil servants.

A particular, refined, and complicated form of ceremony was that of the Byzantine court, which controlled the emperor's meetings with his subjects. Furthermore, it reflected his relationship to governmental institutions and to the Church. It also illustrated the power and legitimacy of the imperial throne by means of public display. A strongly religious element is conspicuously associated with all ceremonial actions. Beginning in late antiquity, the Byzantine court ceremonial was continuously developed over the centuries.

The principal written source for Byzantine ceremonies – in addition to visual art (e.g. mosaics, miniatures) – is the so-called *Book of Ceremonies* (*De Ceremoniis*) of the 10th century, a compilation of earlier and contemporary sources inspired by the emperor Constantine VII Porphyrogennetos (913–59) and completed during his reign (he himself wrote the preface). It contains a great deal of information about the procedures at different festivities of sacred and profane character, such as processions on public holidays from the palace into the churches of Constantinople; the emperor's wedding and coronation; the departure and return of the emperor from and to the capital; triumphs after successful military actions; receptions of foreign rulers and diplomats; and banquets. The work therefore probably served as a manual both for the organizers and for the participants in these events. The rules of protocol concerning the motion and dress of the participants were very precise, as well as about which groups of people were allowed to appear when and how they were to pay homage to the emperor. Although the ceremonial was obliged to tradition, it was by no means inflexible, but adapted to changing conditions over time. This is demonstrated in an anonymous text of the 14th century called *De Officiis*. The author repeatedly calls his contemporaries' attention to the fact that certain elements of a ceremony are no longer in use or that some dignities and titles no longer exist. Non-Greek sources can also contribute to the elucidation of ceremonial procedures. The western bishop Liutprand of Cremona who in the 10th century stayed at the Byzantine court several times on official missions was able to observe some of the ceremonies very closely. Liutprand quite impressively describes the splendour and luxury of such spectacles. The throne room was equipped with artificial mobile animals and a mechanical throne that could be raised and lowered automatically. In addition, the *De Ceremoniis* gives an idea of the precious garments and gorgeous ornamentation of the rooms and the routes the processions took. Court ceremonies had their roots in the Roman empire, but their style was determined by Christianity. Furthermore, a certain oriental influence in behaviour and gestures is evident. The palace area, Hagia Sophia, the hippodrome, and some places and streets of Constantinople were the "stages" for these performances. There were high-ranking officials who were specifically charged to implement the protocol.

One special kind of ceremony was the audience, the meeting of the emperor with certain groups; this was also a relic from Roman times. There were daily morning receptions at which high-ranking officials and dignitaries appeared before the emperor in order to discuss current affairs, and receptions were also held on special occasions. Foreign ambassadors, for example, were led into audience halls reserved for thar purpose. The emperor, dressed splendidly and carrying the insignia of his office, sat on a platform veiled with curtains.

The participants entered in groups (according to their rank or divisions) in company with the master of ceremonies. Porphyry disks in the floor served as markers for certain actions. Absolute silence was required, and only the master of ceremonies spoke, giving short instructions. People had to approach the emperor in a humble way, performing the so-called *proskynesis*, an attitiude of subjection and supplication, which was expressed by different gestures such as bowing the head or the upper part of the body or prostrating. Exalting the emperor in such a way stemmed from his being seen as the representative of God on earth (the emperor himself performed *proskynesis* when praying to God). Thus, an initially pagan ceremony could persist and develop in Christian times.

Acclamations were another important element of ceremonies, i.e. rhythmic speaking choruses offered to the emperor by the people, members of the Senate, ministers, and especially by the leaders of the circus factions (the people's parties). They were the only outlet that the people were allowed to have; otherwise they had to remain silent. In the Roman period these were spontaneous demonstrations of praise, reproach, approval, refusal, demand, or congratulations. They became more and more formalized and professional in time, being mainly carried out by the representatives of the factions. The emperor was praised in a servile way according to stereotypical models. While in late antiquity Greek and Latin words were mixed in acclamations, in the following centuries Greek prevailed. Some frozen Latin expressions for certain occasions were however preserved until late Byzantine times.

There are some remnants of Byzantine ceremonies in the practice of the Orthodox Church. The Byzantine court ceremonial and the rites of the Greek liturgy show strong parallels, because they influenced each other over the centuries. Furthermore, the extraordinary and outstanding position of the emperor was preserved beyond the Byzantine period by the Russian tsars, since Russia saw itself as the successor of the Byzantine empire. This tradition even passed on to Soviet communism and to the socialist nations of Eastern Europe, demonstrated in the personality cults of the party leaders. Even ceremonial elements are to be found: Herbert Hunger has compared socialist slogans used at party congresses with Byzantine acclamations and has found some amazing parallels.

Chaeronea, Battle of

Battle fought between Macedonians and the southern Greeks in 338 BC

It was in the territory of Chaeronea on 2 August (or possibly 1 September) 338 BC that the decisive battle was fought that enabled Philip II of Macedon to bring the Greek homeland under his control.

When Philip negotiated the peace treaty that ended the first war with Athens in 346 BC, his aim seems to have been to win the Athenians' friendship and cooperation, and he insisted that the treaty should be accompanied by an alliance. It failed, however, to effect a real reconciliation. The Athenians could not forget what they saw as his treachery over Amphipolis in 357 BC and they were not reassured by his treatment of their Phocian allies in the immediate aftermath of the treaty's conclusion. Thereafter, although in 344 BC he made an apparently genuine attempt to allay the Athenians' suspicions by offering to amend the peace terms, Philip persistently intervened in Greek affairs in ways that enabled Demosthenes and others at Athens persuasively to depict him as untrustworthy and hostile. In 340 BC he began to threaten the Athenians' corn-supply route from the Black Sea and attacked Perinthus on the Propontis (Sea of Marmora) and Byzantium. His failure to take either city and their own earlier success in expelling his friends from Euboea encouraged the Athenians, who at once declared war when Philip seized their corn fleet near the Bosporus in September.

To wage war positively, Philip needed to threaten Athens, but his old allies the Thebans had recently seized the pass of Thermopylae and seemed likely to bar his way (previously, in 346 BC, a treacherous Phocian general had enabled him to take it and subdue the Phocians). However, a dispute in the Delphian Amphictyony, of which he had been a member since 346 BC, led to a sacred war being proclaimed against Locrian Amphissa and, after the failure of the Amphictyons' first campaign, Philip was given the command.

In autumn 339 BC he advanced over the difficult pass into Doris, ostensibly to attack Amphissa, but unexpectedly turned eastwards down the Cephisus valley and took Elatea on the road from Thermopylae to Thebes, demanding that the Thebans assist him or at least facilitate his invasion of Attica. Demosthenes persuaded the Thebans to refuse and an Athenian force moved into Boeotia. Philip made no further move until the spring of 338 BC, when he took Amphissa. He then made a final attempt to achieve his aims without a battle, but his offers were rejected at both Thebes and Athens; he advanced into northwest Boeotia to find that his enemies were barring his way in a gap of about 2.5 km between the Cephisus and the low hills to the west.

In view of the battle's importance, the information provided by the sources is disappointingly meagre. It was a characteristically Greek head-on clash between two armies consisting of hoplites, heavily armed infantry in close formation, but there is no agreement on their relative strengths. Diodorus Siculus (16. 85) says that Philip with "more than 30,000 infantry and no less than 2,000 cavalry had the advantage in numbers", while Justin (9. 3) gives the Greeks numerical superiority, a conclusion suggested by the incomplete figures in Plutarch

(*Demosthenes*, 17). According to Demosthenes' speech *On the Crown*, contingents from Euboea, Achaea, Corinth, Megara, Leucas, and Corinth supported the Athenians and the Thebans.

As to the disposition of the forces, Diodorus (16. 86) says that Philip faced the Athenians on one wing and his son Alexander faced the Thebans on the other, but gives no further details; Plutarch, however, links Alexander with the river Cephisus on the Macedonian left (*Alexander*, 9).

Diodorus writes in general terms of the fierce fighting, both sides for a while having "hopes of victory", before Alexander's men gradually broke down their opponents and put them to flight (Diodorus' words give no support to the modern theory that his cavalry broke the Theban hoplites), while Philip did the same to the Athenians; although, according to Polyaenus, the collector of military stratagems writing in the 2nd century AD, this was only after a feigned retreat had lured them up a slope to disrupt their order – the only detail of the action provided by the sources.

Information about casualties is also sparse. The only figures in the sources are for the Athenians, more than 1,000 dead and at least 2,000 captured (Diodorus, 16. 86). Theban losses were probably heavier and Plutarch (*Pelopidas*, 18) reports that the Theban Sacred Band of 300 picked hoplites were totally destroyed, although excavations beneath the Lion monument erected in their honour revealed the remains of only 254 bodies.

Philip's victory was so emphatic that he did not need to press on to attack Thebes and Athens. The Athenians prepared to defend their walls, but, still preferring to win their cooperation rather than to crush them, the king paid the due honours to their dead and released their prisoners without ransom. Thereupon they readily accepted his peace terms, agreeing to renew their alliance with him and to dissolve what was left of their maritime confederacy in return for keeping inviolate their territory and institutions. The Thebans were less fortunate, having to ransom their prisoners and accept both a Macedonian garrison and an oligarchic regime dominated by Philip's friends. He then installed a garrison in Corinth and secured friendly regimes in other states, encountering resistance only at the borders with Sparta, where he used a little force to secure the frontiers of the Spartans' neighbours, but otherwise ignored their continuing defiance.

His military control established, Philip ensured his political supremacy by organizing a settlement along the lines of the earlier "common peace" treaties, designed to secure the peace and the loyalty of the Greeks. Confident of his domination, he persuaded them to appoint him leader of a Panhellenic invasion of the Persian empire. After his murder in 336 BC, the decisive quality of his victory was further shown in the meagre support mustered by the Thebans for their rising against Alexander the following year. Macedonian domination was reemphasized by their swift suppression and the total destruction of the city at Alexander's hands, although it was never accepted and was seriously challenged in the confusion following his early death in 323 BC. Greek freedom was never fully restored, not even in the brief period (243–224 BC) when Macedonian garrisons failed to hold Corinth, and in 196 BC the Romans took indirect control of the peninsula, formally annexing it in 146 BC.

The significance of Philip's victory has continued to be recognized in the modern world. In his tenth sonnet (pub. 1645) John Milton referred to it as "that dishonest victory at Chaeronea, fatal to liberty" and George Grote, the first great British historian of ancient Greece, called Philip "the destroyer of freedom and independence in the Hellenistic world" (*A History of Greece*, 1846). The Lion monument was seen by Pausanias in the mid-2nd century AD, but was later demolished. Its fragments were accidentally discovered by the traveller George Lidwell Taylor in 1881, and it was restored and replaced on its ancient plinth beside the old main road north from Levadia by the Greek Archaeological Society in 1902–04.

T.T.B. RYDER

Summary

Battle in 338 BC at which Philip II of Macedon became master of all Greece. For practical purposes it marked the end of Greek self-determination until 1832.

Chalcidice

Region of northern Greece

Lying as it does beyond the land routes that cross Macedonia and being separated from the rest of the country by natural barriers, Chalcidice has had a history that differs from that of mainland Macedonia. The western part of the country was closely associated with Thessalonica: whoever was in control of the city usually had control of western Chalcidice. Chalcidice as a whole is particularly rich in timber and minerals, which is why all powers with an interest in the north Aegean area made efforts to gain control of the region.

Chalcidice first entered Greek history in the 8th century BC with the founding of the first Greek colonies. The country was colonized by the Ionian cities of Euboea, notably, though not exclusively, Chalcis (which provides the etymology of the name Chalcidice). There was only one Dorian colony in Chalcidice, Potidaea on the isthmus of the Pallene peninsula, which was founded by Corinthians *c.*700 BC. Most significant of the other Greek colonies were Olynthus in southwest Chalcidice, Mende and Scione in the Pallene peninsula, Torone in the Sithonia peninsula, Acanthus and Stageira (birthplace of Aristotle) in eastern Chalcidice. The Greek colonization was mainly of an urban type and localized in the coastal areas of the country. An exceptional case was the colonization by Chalcis of rural southwestern Chalcidice which expanded over the area around Olynthus. There settlers from Chalcis lived side-by-side with the non-Greek Bottiaeans. The Greek colonies of Chalcidice became bridgeheads for the diffusion of Hellenic culture in the

hinterland. The first to receive cultural influence from the Greek colonists were the earlier settlers of Chalcidice, the Thracians, Bottiaeans, and Pelasgians; they had become completely Hellenized by the Hellenistic era when Chalcidice became an integral part of the Macedonian state.

In the aftermath of the Persian Wars the cities of Chalcidice were included in the Athenian sphere of influence and all of them joined the Delian League. Events in Chalcidice were among the causes for the outbreak of the Peloponnesian War, as Potidaea was encouraged by its mother-city Corinth to break away from Athenian control in 432 BC. Athens sent an expeditionary force against Potidaea and managed to capture it after a two-year siege. The hostility to Athens, however, was not confined to Dorian Potidaea, but spread among the Ionian Chalcidians as well. Following the advice of the Macedonian king Perdiccas II, an enemy of Athens, the Chalcidians of the area around Olynthus were resettled inside the town in 432 BC, increasing its size and strength and making it a stronghold of anti-Athenian sentiment. More Chalcidian cities reversed their allegiances during the campaign of the Spartan general Brasidas between 424 and 422 BC. The cities that revolted against Athens, starting with Olynthus, made up the nucleus of the Chalcidian League which, after the end of the Peloponnesian War, expanded over the entire region. With a foreign policy dictated from Olynthus, the Chalcidian League built up particularly strong armed forces and, by switching alliances between Sparta, Athens, Thebes, Macedonia, and the Thracian kingdoms, played a leading role in north Aegean politics during the first half of the 4th century BC.

Chalcidian power was challenged when Macedonian imperialism took shape during the first years of Philip II's rule. His first involvement in the affairs of Chalcidice took place in 357 BC when he drove the Athenians out of Potidaea on behalf of the Chalcidian League. Soon, the cities of Chalcidice themselves became victims of Macedonian expansionism, as Philip occupied one after another. Faced with this threat, Olynthus turned for help to its old enemy, Athens, and this provided the occasion for Demosthenes to write his three renowned *Olynthiac* orations urging his fellow citizens to support by all means their former enemies in Chalcidice. Nevertheless, Olynthus fell in 348 BC, Chalcidice became an integral part of the Macedonian state, and, later on, was incorporated into the Roman province of Macedonia. The Hellenistic era is marked by the development of Cassandreia (founded by Cassander in 316 BC), which became one of the major cities in Macedonia and one of its few Roman colonies (Pella, Dion, and Philippi were the others).

Medieval Chalcidice developed in the shadow of Thessalonica and the Holy Mountain. The main towns of the region in that period were Cassandreia, Ierissos, Hermeleia, Rebenikeia, and Rentina, though none among them was particularly significant. Cassandreia, in particular, had lost much of the importance it had in Hellenistic and Roman times. From the 10th century onwards, when the monastic community was officially established on Mount Athos, the rest of Chalcidice became progressively the backyard of the Holy Mountain. The monastic domain expanded enormously by means of imperial and private donation, or through direct purchase of property by the monasteries, and incorporated a great deal of land and property in Chalcidice including entire villages. Collections of documents relating to these monastic possessions are still preserved in the archives of the monasteries and have become a prime source for the study of Byzantine rural society, economy, and demography, by taking the villages of Chalcidice as case studies.

The medieval monastic documents shed much light on the agricultural economy of Chalcidice. Mining, which was the second most important economic activity of the region, is better documented during the Ottoman period (Turkish occupation of Chalcidice began as early as 1387, followed by an interval of restored Byzantine rule and then Venetian rule in western Chalcidice between 1403 and 1430). Mining was undertaken in several villages of the region, mainly in the central and eastern areas, which later became known as "Mademochoria". The principal centre of mining was the town of Siderokausia in the northeast of the country. Particular attention was paid to the development of silver mining at Siderokausia during the reign of Süleyman I in the 16th century when the task of organizing and directing the extraction and processing of the ore was given to German masters, while more than 6000 workers and dealers, Greeks, Jews, Bulgarians, and others, were employed in the business.

The Ottoman government had granted a special administrative status as well as fiscal privileges to several villages in Chalcidice. In the 18th century some groups of villages with common status and the same privileges joined in confederations with communal authority. One of those confederations consisted of the villages that had been mining centres, known as Mademochoria, though the mining had declined sharply by then and stopped completely in the 19th century. Another confederation was formed by the so-called "Chasikochoria", in western Chalcidice, which constituted a domain (*hass*) of the sultan's mother. A third was composed of the villages of Cassandra (Pallene) peninsula, a *waqf* (pious donation) intended to provide subsidies for the poor of Mecca and Medina.

Chalcidice and the region of Mount Vermion, including Naousa, were the only parts of Macedonia where the Greeks rose in rebellion during the War of Independence. In the case of Chalcidice, this is explained by the revolutionary fervour and enthusiasm that was shown by many of the monks of Mount Athos who were members of the *Philike Hetaireia*, as well as by the possibility of support and supply by sea. In late March 1821 the Serrean patriot Emmanuel Pappas arrived in Mount Athos and began to stir up revolt. Fighting broke out in June at Polygyros, one of the "Mademochoria" in central Chalcidice and presentday capital of the region, and spread through the country. Nevertheless, the Greeks were not strong enough to repel the Turkish counteroffensive and, after losing the area of Polygyros, organized a last defence in Cassandra peninsula which was crushed in December 1821.

Ottoman rule in Chalcidice ended in 1912 as a result of the Balkan Wars. The history of the region in the 20th century is marked by the arrival of Greek refugees from Turkey after 1922. In order to provide for their rehabilitation the Greek government proceeded to confiscate the monastic estates, which still amounted to a large area of land in Chalcidice, undertaking to subsidize the monasteries in return. The economy of contemporary Chalcidice has grown remarkably due to tourism, while the recent discovery of gold deposits

offers further opportunities for the development of the region, though it has given rise to controversies on environmental issues.

KONSTANTINOS P. MOUSTAKAS

Summary

Though officially part of Macedonia, Chalcidice has had a history of its own due to its geographical isolation. It was first colonized by Greeks in the 8th century BC, notably from Chalcis (whence its name). After the Persian Wars the cities of Chalcidice joined the Delian League, but later changed allegiance. They were absorbed by Macedon in 348 BC. From the 10th century the region was dominated by the monasteries of Mount Athos whose estates were confiscated in the 20th century to accommodate refugees from Asia Minor.

Chalcis

City in Euboea

Chalcis is located on the narrowest point of the Euripus and is the capital of the district of Euboea. Today it is a bustling capital city of about 50,000 inhabitants and the town profits from trade in several important commodities (including livestock, butter, and agricultural tools). Modern Chalcis obscures the remains of the ancient city, which was famous for its manufacture of bronze (the city may have received its name from this trade, since *chalkos* means "bronze"). The Mycenaean city praised by Homer (*Iliad*, 2. 540) has yet to be discovered, but some ancient remains from the late Geometric period on have been found in the area of the modern town.

Chalcis played an important role in the developments of Geometric and Archaic Greece. The inhabitants were known for their commercial enterprise (including trade in pottery and metalwork) and colonizing ventures (founding colonies and trading posts on the coasts of Sicily, Italy, Chalcidice, Thrace, the islands of the Aegean, and possibly Syria). Perhaps most famous, while at the same time least understood, is the role that Chalcis played in the Lelantine War with Eretria. Apparently, during the late 8th century BC Chalcis and Eretria were in competition for land and power, which led to a war over the rich Lelantine plain. Strabo (*Geography*, 10. 1. 9) says that this plain was famous, among other things, for its curative hot-water fountains, which were even used by the Roman general Sulla. This early Hellenic conflict over the Lelantine plain involved, at least, Miletus, which supported Eretria, and Samos, which supported Chalcis. Thucydides implies that numerous other states were involved. While the 8th-century victor is unknown, Chalcis seems to have held the plain in the 7th century BC.

Chalcis was ruled by a monarchy until the 7th century BC, when its last king Amphidamus was killed in battle. (Aristotle, in *Politics*, 1304a, mentions a later, but otherwise unknown tyrant, Phoxus, who was overthrown by the elites of the city.) The aristocracy then took over, and eventually supported the Athenian tyrant Hippias who fled there after his expulsion from power. Tragically for their independence, the people of Chalcis allied with Boeotia against Athens, partly in an attempt to restore Hippias. The Athenians then attacked and defeated the Chalcidians, took their land for the settlement of 5000 cleruchs, dismantled their navy, and assumed control over their colonies in Italy and Sicily. The Athenians, proud of their success against Chalcis, set up a chariot on the Acropolis and inscribed it with news of their victory (Herodotus, 5. 77. 4; Diodorus, *Historical Library*, 10. 24. 3). In 480 BC the people of Chalcis supported the Athenians against Persia and sent at least 20 ships to the Greek fleet. Soldiers of Chalcis also fought in the Battle of Plataea.

Demosthenes in his orations on *Philip*, *On the False Assembly*, and *Against Midias* highlights the role that Chalcis played in early Macedonian attempts to influence and control Greece. Originally Callias, the general from Chalcis, supported Philip, but he then turned against Macedon in a successful attempt to rid the Euboean cities of Oreus and Eretria of tyrants. Nevertheless Philip took the city and garrisoned it in 338 BC. It remained important as a strategic control point and trade centre until 146 BC, when it was attacked and severely damaged by the Romans.

Once in the Roman sphere, the city, and Euboea, first became part of the province of Macedonia, and then in 27 BC the island became a part of the province of Achaea. Chalcis, due to its strategic location, remained economically viable throughout the Roman period. During the early Byzantine period, pagan temples were replaced with Christian monasteries and churches. By the 9th century AD silk was crucial to the economic life of the provincial Byzantine nobles in Chalcis. (In 1147 Roger II, king of Sicily, used his army to kidnap silk workers from Chalcis.) The Venetians captured and fortified the city in 1210, and made it the capital of Negroponte ("Black Bridge", referring to the whole of Euboea), the name deriving from a corruption of the Greek *ston Egripo* ("on the Euripus") and the Italian *ponte*, referring to the movable bridge built by Justinian. After a brutal battle in Chalcis against Sultan Mehmet II in 1470, the town fell to the Turks and then became the headquarters of *kaptan pasha* (admiral). The remains of the Turkish fortress, built in 1686 on top of the castle of Karababa (originally designed by the Venetians), apparently rest on even more ancient foundations – perhaps those of a Macedonian fort built *c.*334 BC. Chalcis remained in Turkish hands until 22 February 1833 when at last Chalcis and Euboea

were freed from external rule, and Euboea was declared part of independent Greece.

The bridge spanning the Euripus channel at Chalcis also has an interesting history. The first fixed bridge was wooden, built in 411 BC, partly to interfere with Athenian maritime trade. In 334 BC towers, a wall, and gates were added to strengthen the defensive capabilities of the bridge. This structure remained more or less intact until Justianian replaced the fixed structure with a movable wooden bridge (intended to facilitate waterborne traffic). The Turks replaced Justinian's bridge with another fixed bridge, which remained in place until 1856, at which point a new swing bridge was constructed. The Belgians, in 1896, made major changes including enlarging the channel and erecting an iron swing bridge. The existing structure was created in 1962.

The city now houses a Folklore Museum, a storage house of medieval antiquities, and a small, well-kept Archaeological Museum. The Archaeological Museum displays Mycenaean pottery from local tombs and marble remains from Chalcis, Eretria, and Carystus. Sparse archaeological remains of buildings and graves have been found on the castle hill and fragments from other ancient structures may be seen built into the castle walls and other structures. The local synagogue, rebuilt in 1849 on its original foundations, includes in its walls tombstones from an ancient Jewish cemetery dating back at least 1,200 years. The modern city flourishes and is a popular route into Euboea for European and Athenian travellers.

CYNTHIA K. KOSSO

Summary

The largest city in Euboea located at the narrowest point of the Euripus, Chalcis played an important part in colonizing Sicily and Italy in the 8th century BC. It fought Eretria for possession of the Lelantine plain. In the Classical period it was dominated by Athens. In antiquity it was famous for its bronze working and in the Middle Ages for silk production.

Chandris, Antony 1924–1984

Shipowner

Antony Chandris, president of the Union of Greek Shipowners from 1975 to 1981, succeeded in bridging the previously deep gulf between the Greek state and public opinion on the one hand and Greece's main industry on the other.

His father was a shipowner from Chios. He was educated at Athens College and as a marine engineer at the polytechnic in Lausanne. He and his brother Dimitri Chandris made Chandris Lines a leader in the 1950s and 1960s in passenger shipping, especially the movement of emigrants to Australia, but then switched the focus of their activities to tankers and cruise vessels.

Like most members of the shipping community, Antony and his wife Ourania Nikolaou lived in London. Greek politicians and public opinion felt that shipowners, who controlled by far the largest Greek industry, were contributing little to the country. On the other hand, there was resentment and suspicion following attempts by the government to impose retrospective taxation and to attach the insurance earnings gained from merchant ships sunk during World War II. In 1955, 80 per cent of Greek-owned tonnage flew foreign flags.

During this period the London-based Greek Shipping Cooperation Committee was influential. The chairmanship of his friend, John C. Carras (1963–65), brought ideas for a closing of the gap which found their way into the proposed five-year economic plan elaborated under the aegis of Andreas Papandreou in 1965. Some were, ironically, put into effect by the colonels after 1967, but the support of the dictatorship by many shipowners made Greek public opinion more hostile than ever.

Chandris was vice-chairman of the committee from 1967 to 1975. After the dictatorship fell in 1974, he stood for the presidency of the Union of Greek Shipowners. Narrowly failing in November 1974, he was triumphantly elected in January 1975, and unanimously re-elected in 1979. During his presidency the present institutional framework of Greek-owned shipping was put into place: with an eighth of total deadweight tonnage in 1980 the Greek merchant fleet was the largest in the world. The taxation system and other important provisions were entrenched under the Constitution of 1975. The year 1981 saw the highest proportion of Greek-owned tonnage ever under the Greek flag: 42 million tons to 12 million.

Chandris was a patient negotiator and determined bridge builder, and his humanity and warmth were proverbial. Under him the union succeeded for the first time in reaching out to a wide range of political opinion and integrating the interests of shipping with those of the country. He also organized its effective representation internationally, in the US, the European Union, and elsewhere.

A man of broad interests, Chandris invested substantially inside Greece. He was a co-founder of *Elliniki Etairia* (the Greek Society), Greece's main conservation organization, and supported important restoration work at the 11th-century church of Nea Moni on Chios. When he resigned in 1981 due to lung cancer, the shipping industry had become a respected partner both within and outside Greece.

COSTA CARRAS

Biography

Born in 1924, Chandris was educated at Athens College and studied marine engineering at Lausanne Polytechnic. He and his brother Dimitri built up Chandris Lines, first as a leading passenger carrier, and later switched to tankers and cruise ships. Antony Chandris was President of the Union of Greek Shipowners from 1975 to 1981. He died in 1984.

Chatzidakis, Georgios N. 1848–1941

Linguist

Chatzidakis is considered to be the pre-eminent linguist of Greece and one of the most influential individuals in shaping the study of the Greek language. Born in Mirtos in Crete, he studied Greek and Latin philology at the Philosophy Department of the University of Athens between 1873 and 1877, and received a scholarship to study linguistics in Germany, attending the universities of Leipzig and Berlin, as well as that of Vienna. He received a doctorate from the Philosophy Department at Athens University in 1883, with his thesis *Symvoli eis tin Istoria tis Ellinikis Glossis* (Contribution to the History of the Greek Language). He was designated interim professor of linguistics and of Indian philology at Athens University in 1885, appointed dean in 1905, and continued to teach at the university until 1923. He founded the University of Thessalonica, where he taught linguistics, and was dean from 1926 to 1928. He became a member of the Athenian Academy in 1926 and in 1927 was voted its president. He established the *Glossiki Hetaireia* (Language Society), as well as other scientific guilds. He died in Athens in 1941.

Despite its antiquity and remarkable importance for the illustration of linguistic principles and the evolution of words, the Greek language and its history, apart from the Archaic and Classical periods, had been mostly neglected by scholars. Chatzidakis's *Sintomos Istoria tis Ellinikis Glossis* (Short History of the Greek Language) was a succinct study, aimed primarily at a general readership.

A pupil of the philologist Kostantinos Kontos at the University of Athens, Chatzidakis used katharevousa (a form of Greek based on the spoken language but "purged" of modern elements) in his writings, but because he was a student of comparative linguistics and was thus able to view Greek bilingualism historically and objectively, he fought for its simplification, recommending, for example, that it be relieved of the infinitive and optative. Most significantly, he enabled the systematic study of demotic to be accepted at Athens university, where the "purist" language was used. He ultimately became one of the leading purists and used his influence between 1917 and 1920 to prevent the universal adoption of demoticism.

Chatzidakis was one of the first Greeks to study the medieval and modern Greek language, and in 1928 he founded the medieval archives of the Athenian Academy. The linguistic character of medieval texts was extensively and ardently debated by the two foremost Greek authorities on the subject, Chatzidakis himself and his adversary, Yannis Psycharis. Chatzidakis maintained that the beginnings of modern Greek could be traced as far back as the 6th century AD. He also argued that the language of medieval writers should not be taken as a manifestation of the popular speech of the day and, therefore, no emphasis should be placed upon it by historians of the language. Psycharis, on the other hand, contended that the formative period of modern Greek extended from the 10th to the 18th centuries, and believed that works written during this period were reliable witnesses to the dialects of their time, and thus could be relied upon for an understanding of the condition of the popular language in the last few centuries. Ultimately, Psycharis's theory met with little favour outside his own immediate circle, which was composed mainly of his former students. Nearly all modern Greek scholars concur with Chatzidakis, both in terms of the date of the beginning of modern Greek and with regard to the nature of the medieval written language. The linguistic struggle between Chatzidakis and Psycharis, on these and other issues, reached its height with the *Evangeliaka* (1901) and the *Orestiaka* (1903).

Chatzidakis also maintained that the Greek language, in spite of its peculiarities, remained the most Indo-European of all the languages in its group, exhibiting a comparatively true and accurate picture of the parent tongue, especially on such points as vocalism, verbal forms, and syntax. In one of his classic studies, *Peri tis Enotitos tis Ellinikis Glossis* (On the Unity of the Greek Language), Chatzidakis proved that Greek still uses or, at the very least, allows for the understanding of words used as far back as the composition of the New Testament. It was to this fact that he attributed the special bond that the Greek people feel for their language.

Without George Chatzidakis's work our understanding of the demotic language would have remained opaque. His scholarly study of this field dissipated much misguided teaching and increased our understanding of the Greek language. The fact that Chatzidakis did not use his influence and knowledge to promote the establishment of demotic as the official language is considered a failing, but it can only be assumed from his confidence in the language that demotic had not yet matured sufficiently to position itself as the official written language of Greece.

Biography

Born on Crete in 1848, Chatzidakis studied at the School of Philosophy of the University of Athens in 1873–77 and attended the universities of Leipzig, Berlin, and Vienna before taking his doctarate in Athens in 1883. He taught linguistics at Athens from 1885 to 1923 and was dean of the University of Thessalonica from 1926 to 1928. He championed the study of demotic and, in opposition to

Psycharis, traced its origins back to the 6th century AD. He died in Athens in 1941.

Chatzimichail, Theophilos 1873–1934

Folk painter

Theophilos (as he is usually known) began painting in his home at a very early age, but the tradition that he was taught by his maternal grandfather, the icon painter Kostantis Zografos, cannot be confirmed. His left-handedness made it difficult for him to follow his father's trade as a shoemaker; physically weak, and with a marked stutter, he was mocked by his peers and by early adolescence was socially isolated, devoted entirely to painting, traditional stories and songs, and an active fantasy life.

Before 1890 he left Mytilini on Lesbos for Smyrna, where he made his living as a painter, receiving lodging or a meal in payment for his work; his paintings from this period, on walls and furniture, have not survived. In Smyrna he adopted the fustanella as his everyday dress, sometimes with the full equipment familiar in the uniform of the National Guard, "dressing up" as a stereotypical Greek in a city of mixed culture, rather than wearing traditional costume, which on Lesbos meant *vrakia* (baggy knee-breeches). He also paraded about the city as Alexander with a gang of street children as his "Macedonians". It is now impossible to determine if his claim to have been a bodyguard at the Greek consulate in Smyrna had any basis in reality or was a reflection of these playacting fantasies.

After 1900 he moved to Thessaly, and continued to live by painting, receiving commissions both from residents of the villages on Mount Pelion and in the city of Volos. He returned to Mytilini in 1927. Soon afterwards, the Parisian art critic Tériade (Stratis Eleftheriadis, 1897–1983, a native of Skamnia on Lesbos) discovered his work, and in 1929 contracted to buy whatever Theophilos produced, providing him with supplies and encouraging him to move from wall painting to the more permanent and portable medium of canvas. In the following year an article by Kostas Ouranis in a national newspaper made Theophilos known more generally in Greece.

Both in the Pelion region and on Lesbos Theophilos was heir to a well-established tradition of wall painting in house decoration. What makes his work distinctive is that his painting was not restricted to the inner walls of bourgeois homes, but to a wide variety of surfaces, indoors and outdoors; his most famous work was the decoration of a taverna at Karini, on the way to a shrine of the Virgin at Ayiassos which attracts visitors from beyond Lesbos. Even more important was his choice of subjects; as well as traditional floral designs and landscapes, Theophilos decorated everything with paradigmatic figures of Greek traditional culture: ancient Greek gods and heroes, Alexander, Erotokritos, and the leaders of the War of Independence. The last, the subject of his most enduring fantasies and performances, are painted with a clarity and intensity that have few parallels. In the canvasses made for Tériade after 1929 he also portrayed a traditional way of life which was being rapidly replaced by a more homogenized modern (he would have said "Frankish") culture, symbolized by the aeroplanes he included in his latest paintings. In such paintings as his portrait of a musician from Lemnos and a representation of Mytilini in 1888 (before he left for Smyrna), there is the same vivid recall of a world now lost as in other works produced in Lesbos after the Asia Minor catastrophe, such as Elias Venezis's *Aeolia* and Stratis Myrivilis's *Vasilis Arvanitis*. Even though Myrivilis did not admire Theophilos artistically, he found him an appropriately archetypal figure to appear with his folk hero Vasilis Arvanitis in a nostalgic evocation of Greek traditional culture.

Along with his paints, Theophilos's workbox included a collection of postcards, photographs, and illustrations from school texts and popular literature. Some of his paintings are clearly derived from these pictures; but he produced works of startling originality, and even his most derivative works introduce new elements of light and colour, and are generally far more alive than their models.

For the poets Andreas Embeirikos, Odysseus Elytis, and George Seferis, the discovery of Theophilos in the 1930s was a critical point in their intellectual development. Like General Makriyannis's *Memoirs*, Theophilos represented a vital and authentically Greek popular tradition, as different from 19th-century academic European art as the general's Greek was from the artificial classicizing language of official culture. Theophilos's position as an iconic figure of Greek popular culture has since been enhanced by fictionalized treatments of his life, such as the *Myth of Theophilos* by Nestoras Matsas (1971) and the television film *Theophilos* by Lakis Papastathis (1987).

The largest collections of Theophilos's works are in the Museum of Theophilos in Varia outside Mytilini and the house of Yannis Kontos in Anakasia (Pelion); although the decoration of the taverna at Karini has largely disappeared, a decorated counter is still in use in a *kafeneion* in Ayia Paraskevi on Lesbos. Reproductions of several paintings are available on the World Wide Web, on sites maintained by the Greek Ministry of Culture (www.culture.gr).

Biography

Chatzimichail, usually known by his first name Theophilos, was born in Mytilini on Lesbos in 1873 and may have been taught to paint by his grandfather, the icon painter Kostantis Zografos. He moved to Smyrna and later to Mount Pelion, making a poor living as a journeyman painter of tavernas and coffee houses. Soon after his return

to Mytilini in 1927 his talent was recognized by the Parisian critic Tériade. He died in Mytilini in 1934.
